motivi koji ovaj put pokreću organiziranje manifestacije pod starim naslovom »tendencije« mnogo se razlikuju od onih koji su nas pokretali i vodili u realizaciji prijašnjih istoimenih akcija. izložbe koje će biti otvorene, debata koja će se voditi i publikacije koje će biti štampane imale bi nam poslužiti da dinamičnije pregledamo iskustva koja su se akumulirala, da se uoče problemi koji su se pojavili, da ocijenimo pojedine napore, pojedinačne i opće trendove u radovima i — situaciju u kojoj se nalaze istraživači i sredine u kojima djeluju. rezultati analiza izložbi, ishod debate i sadržaji publikacija željeli bismo da nam budu pouzdana baza za nove napore. jer, pitanja koja su se postavila na prvim »novim tendencijama« nisu riješena niti su nestala, nego se pred nama postavljaju sve ozbiljnija i fatalnija.

debata će se voditi pod naslovom »racionalno i iracionalno« u vizuelnim istraživanjima. taj radni naslov treba shvatiti uvjetno. u našem prijedlogu racionalno i iracionalno nemaju značenje termina koji se isključuju, ne znače ekstremne položaje neke metode, a najmanje su to principi koji se jedan drugome suprotstavljaju kao »dobro« i »zlo« u mitovima svih vrsta. organizatori manifestacije t-5 ne žele da debata pod predloženim naslovom bude »akadem-ska« i »apolitična«. naprotiv, treba nastojati da se u njoj pojave što je moguće jasnije polarizirana gledišta. tako će se, nadamo se, u neposrednom susretu ili srazu ideja stvoriti temelji za zaključke koji bi u slučaju klasičnih diskusija izostali. uvjereni smo, naime, da ne treba suprotstavljati samo cijele sisteme, nego u otvorenoj dilemi, međusobnom ogledanju i direktnom sukobu različitih gledišta valja očekivati konkretne idejne vrijednosti. nadamo se također da će sažeti način debatanja, bez epskih opisa apstraktnih predodžbi i reprezentativnih i autoritativnih deklaracija, neutralizirati opasnosti dominacije osobnih interesa.

izložba na kojoj će sudjelovati istraživači u oblasti konstruktivnih vizuelnih programa pokazat će jesu li te oblasti iscrpljene ili se u njima još može naći dovoljno aktualnih zadataka i — postoji li istinska općedruštvena potreba rješavanja tih i takvih zadataka ili se u komercijalnoj potražnji ogleda samo iluzija o potrebitosti napora te vrste. pokaže li se da postoji filogenetička veza između konstruktivističkih istraživanja i vizuelnih istraživanja pomoću kompjutera, i potvrdi li se dosad nejasna pretpostavka da se ideje novih tendencija nastavljaju (bar u svojim posebnim implikacijama) u sistemima ideja koje su se razvile prilikom upotrebe elektronskih računara, onda to može biti potvrda naše koncepcije manifestacije t-5.

In organizing the event under the old title of "Tendencies" we have been motivated by completely different considerations from those which led us to organize earlier events under the same title. The exhibitions which will be held, the debates which will be conducted and the publications to be produced, will give us a dynamic survey of the experiences which have accumulated, will help us to understand the problems which have cropped up, to evaluate certain efforts, and the individual and general trends in the works. In addition they will give us a picture of the general position of the artist-explorers and of the environment in which they live and work. The results of the analyses of exhibitions, the outcome of debates and the contents of publications will, we hope, be used as a reliable basis for new efforts. For, the problems which cropped up at the first "New Tendencies" have not been resolved, nor have they disappeared; they have now become even more significant and more fateful.

The title of the debate will be "the rational and the irrational in visual research". This working title should be regarded as conditional. In our proposal the rational and the irrational do not have the connotation of terms which mutually exclude one another, they do not denote the extreme polarities of a certain method, and least of all are they principles opposing each other like the ideas of "good" and "evil" found in all kinds of myths. The organizers of the event T-5 do not want the debate under the proposed title to be "academic" or "a-political", but on the contrary, they want it to bring forth clearly polarized attitudes. In this way, we hope that the direct exchange or confrontation of ideas will enable us to reach certain conclusions which could not be arrived at through discussions of the traditional kind. We are, in other words, convinced that one should not limit oneself to the confrontation of systems in their entirety, but in an open dilemma, through competition and through direct confrontation of given attitudes one can expect to arrive at new values and ideas. We also hope that by keeping debates within limits, uncluttered by epic descriptions of abstract ideas and representative and authoritative declarations, we will entirely reduce the danger of the domination of personal interests.

This exhibition, in which explorers in the field of constructive visual programmes will be taking part, will show whether these fields have been exhausted or whether a sufficient number of current task still remains to be fulfilled; and also — whether there is a general public need felt for the accomplishment of these tasks or only an illusion as to the need for efforts of this kind, created through commercial demand. If a philogenetic link is

onaj dio izložbe koji je posvećen vizuelnim istraživanjima pomoću kompjutera imao bi pokazati da u toj oblasti nema krize motivacija i metoda, nego da postoje jedino kritične situacije u odnosu prema takvim istraživanjima, jer ono što su rani predstavnici novih tendencija mogli reći o »umjetnosti« i društvenom položaju i zadacima istraživača, to se neočekivano izrazitije pojavilo u vizuelnim istraživanjima pomoću strojeva. vjerojatno će izložba kompjuterista biti još jedna dobra prilika da se ponovo razmotre problemi koji su nikli nakon ekspanzije gledišta teorije informacije.

izložbu primjera »konceptualne umjetnosti« (ili: istraživanja) ne treba prije početka debate stavljati u poziciju dijametralno oprečnu konstruktivizmu i kompjuterskim istraživanjima. ne treba smetnuti s uma da se tumačenja i temeljne izjave više predstavnika konceptualnih istraživača umnogome poklapaju bar s dijelom izjava i programa predstavnika konstruktivizma. također ne treba pomišljati da se metode konceptualista mogu uvijek svesti na takvu obradu podataka u kojoj nema racionalne kontrole točkova procesa. (jesu li svi tokovi procesa istraživanja pomoću kompjutera u cijelosti racionalno kontrolirani?) kao što je slučaj s konstruktivistima i kompjuteristima, tako je i u primjerima konceptualnih istraživanja: posljednje konzekvencije, pa i pretpostavke od kojih se polazi, nisu uvijek i za svakoga prihvatljive. ali, one postoje. i — kako nisu nastale bezrazložno, nego imaju svoj izvor i djeluju, to nam dostaje da ih razmotrimo, shvatimo i ocijenimo. to nam je u našim angažmanima prijeko potrebno.

radoslav putar

found to exist between constructivist research and visual research by means of computers and — if the assumption, rather unclear until recently, is confirmed that the ideas of the New Tendencies are being pursued (at least in their special implications) within the system of ideas which have developed with the use of computers, then this will be an acknowledgement of the general framework of our event T-5.

That part of the exhibition dealing with visual research by means of computers should show that there is no crisis of motivation and method in this field, but only critical situations in relation to such research. For, whatever early representatives of the New Tendencies could have said about "art" and the social position and the tasks of artist-explorers, could now be said to exist to a larger and quite unexpected degree in visual research by means of computers. The exhibition of computerists will probably be another occasion to re-examine the problems which have sprung up after the dissemination of information theory attitudes.

The exhibition of works representative of "conceptual art" (or: investigation) should not be diametrically opposed to constructivism and to computer research before the debate even begins. One shouldn't forget that the interpretations and fundamental statements made by a number of representatives of conceptual investigation largely coincide, at least with some of the statements and programmes of representatives of constructivism. Nor should one think that the methods of conceptualists can always be reduced to such data processing in which there is no rational control over the process. (Are all the stages in the computer research process totally rationally controlled?) As in the case of constructivists and computerists, we find in examples of conceptual investigation that the final consequences and even the initial assumptions are not always acceptable to everyone. There assumption do, however, exist. And, as it is not without reason that they have come into being, for they have their source and impact, it is, therefore, sufficient for us to examine, understand and evaluate them. In our commitments this stands out as a necessity.

Radoslav Putar

konstruktivna vizuelna istraživanja

constructive visual research

Već smo navikli na priznanja koja dolaze naknadno, s određenim zakašnjenjem. Mogli bismo reći da se to sada odnosi i na NOVE TENDENCIJE. U posljednje vrijeme o njima se sve češće piše. Spominju se različitim povodima, s razlogom, ponekad s nostalgijom, ali nerijetko i bez opravdanja. Ipak, u svakom slučaju s mnogo većim poštovanjem i simpatijama nego u doba kad su se NT kao pokret rađale. Ako su simpatije očito porasle, ne bi se moglo reći da je poraslo i razumijevanje suštine toga pokreta, karakterističnog za kraj šestog i prvu polovicu sedmog decenija. Čini se, dva su razloga tome: prvo što pokret NT danas već povijesti pripada i ne ugrožava više ničije interese, ne remeti utvrđene odnose, ne unosi zabunu među kritičare, ne izaziva revolt dijela publike, i drugo, jer još uvijek o pokretu cjelovita studija nije napisana. Brojni sačuvani dokumenti, izjave, komentari, svježa sjećanja samih sudionika na prve susrete i mladenački bučne rasprave kao da nisu bila dovoljna podloga za smirenu analizu i objektivnu ocjenu. Iako, su mnoga djela već odavno našla svoja mjesta u muzejima, a rezultati vizuelnih istraživanja pripadnika NT ušli u naš svakodnevni život (na malim ekranima, na filmu, u kazalištu, na plakatima, omotima knjiga, oglasima), čini se da je potrebna ipak nešto veća vremenska distanca da bi se moglo svestrano ispitati porijeklo ideja, njihov kasniji odjek i utjecaji, sagledati svi početni poticaji okupljanja i motivi zajedničkih nastupanja. Kad za to dođe vrijeme, trebat će na mnoga pitanja dati jasan odgovor. Prije svega je li to uopće bio pokret? Ako jest, koje mu bijahu značajke, tko je uistinu njemu pripadao? Gdje su njegovi počeci a gdje su mu granice? Zašto i kada započese unutarnja razmišljanja? Pogotovo ona o kojima je Alberto Biasi govorio 1968. (na međunarodnom kolokviju u Zagrebu), ustvrdivši čak da su NT praktički prestale postojati već 1965. Da li baš 1965, ili ipak nešto kasnije? Zar upravo one godine kad se u Brezovici okupio dotada najveći broj sudionika, kad je A. A. Moles uvjerljivo razlagao mogućnosti primjene teorije informacije i Neumann-Morgensternove teorije igara te upozorio na korisnost upotrebe kompjutera u daljnjim vizuelnim istraživanjima? Naravno, u sklopu tih pitanja trebat će utvrditi i ulogu i značenje manifestacija održanih u Zagrebu od 1961. do 1969.

Iako su ta pitanja upućena budućem povjesničaru, ipak ne bismo smjeli odgađati s odgovorima bar na one probleme koje su NT u sebi nosile od samog početka. Među njima je jedan od osnovnih bio i ostao problem postupka pri sastavljanju programa i načina utvrđivanja kriterija za iznalaženje optimalnih rješenja pri izboru struktura s najvećom količinom estetskih informacija.

Idući tragom ispitivanja vizuelnih percepcija mnogi su autori stvorili dosad brojne vlastite sisteme zasnovane na

We know that recognition usually comes late; it seems that it is now finally being accorded to the NEW TENDENCIES movement. More and more is being written about it; it is mentioned on various occasions with approval and even nostalgia, but very often with no true understanding. It must be said, however, that the movement is receiving much more attention now than at the beginning, although many people tend to misunderstand the spirit of the movement which is characteristic of the late Sixties and early Seventies.

In many ways the movement is already a part of history. It is not felt as a threat to anybody's interests, it does not unsettle the existing pattern of relationships, it no longer intrigues the critics, the public has largely got used to it, but as yet nobody has made a comprehensive study of the movement. The many documents, statements, commentaries, the lively accounts of the early days and their noisy quarrels are still waiting to be analyzed "in tranquillity" and to be assessed fairly. Many New Tendencies works have long ago found their place in museums, the results of the movement's experiments have become a part of our everyday existence (on television, film, in the theatre, on posters, book jackets and advertisements). Perhaps time is still needed to achieve a full study of sources and ideas, of the movement's later development and influence, of the motives that brought the members of the group together, etc.

Many questions will have to be answered in the course of this study. Was it a movement at all? If so, what were its characteristics? Who belongs — or belonged — to it? What were its sources and limits? When did it begin to disintegrate? What were the problems that Alberto Biasi spoke of at the international meeting in Zagreb in 1968 when he affirmed that the New Tendencies had ceased to exist as a movement as early as in 1965? Was it in 1965 or a little later? Did the movement begin to disintegrate in the very year of the Brezovica meeting (the largest up to that time) when A. A. Moles spoke so persuasively of the need to apply the theory of information and the Neumann — Morgenstern theories, and of the need to use computers in further research? It will also be necessary, of course, to study the role and importance played by the manifestations held in Zagreb from 1961 to 1969.

Apart from these questions which are for the historian, we should at least try and solve some more immediate problems present from the beginning. One of the most pressing problems regards the procedure of setting up the NT programme and of formulating more precisely criteria that would allow us to select those structures which contain the greatest quantity of aesthetic information.

kombinatoričkim principima. Bez obzira na to jesu li do njih dolazili spontano ili s određenim namjerama, ovisno ili neovisno jedan o drugome, s jasnim ciljem ili samo sa željom da se zadovolji znatiželja koju potiče na početku svaka igra neizvjesnošću ishoda, svi su se oni našli na području kombinatorike i računa vjerojatnosti. Iza svake vizualizirane strukture, sastavljene od niza istovjetnih ili različitih elemenata, raspoređenih u nizovima ili redovima, postojala je uvijek i numerička struktura, po kojoj se veoma jasno moglo raspoznati je li riječ o sistemu permutacija, kombinacija ili varijacija. Ovisno o vrsti kompleksija bilo je moguće odmah utvrditi i točan konačan broj svih mogućih struktura koje je svaki od tih sistema dopuštao. Kako su, međutim, u pravilu to bili veliki brojevi, zbog memoriranja iskazivanih u faktorijelima ili potencijama, problem izbora izbio je normalno u prvi plan interesa. Nametnulo se ne samo pitanje kako utvrditi redoslijed toka struktura, nego još važnije, kako razdvojiti estetski relevantne od banalnih, a između estetskih relevantnih one najvrednije. Postoje li, kažimo otvoreno, matematička pravila kao rješenje, osim zakona vjerojatnosti? Pravila koja bi nas približila formuliranju objektivnijih kriterija? Ili se ponovo suočavamo s onim »vječnim« pitanjem prijelaza Nebića u Biće?

Nataložena iskustva posljednjeg desetljeća nisu mala, ali nisu ni ispitana. U ovom trenutku, kad se još uvijek nalazimo na pragu vizuelnih istraživanja s pomoću komputera, ta iskustva mogu postati višestruko korisna. Spomenimo samo da je Almir Mavignier, zahvaljujući vjerojatno poznanstvu sa Sigridom Quarchom, već 1961. započeo kontinuirano ispitivanje permutacionih sistema i dalje ih nastavlja. Vasarely je 1966. objavio numerički program slike »Boglar«, a Enzo Mari program jedne od svojih struktura nastalih 1963, dok je Le Parc to učinio 1970. publicirajući svoj numerički sistem boje iz 1959. Bili su to poticaji za nov način analize njihovih djela, koji bi trebalo primijeniti i na ostale pripadnike te porodice.

Budući da je tema ovogodišnjeg susreta »racionalno i iracionalno u suvremenoj umjetnosti«, smatrali smo korisnim izložiti djela tih umjetnika kako bismo spomenute probleme još jednom istakli.

To što se neki od pozvanih nisu odazvali, a neki od prisutnih napustili prije započeta istraživanja, samo potvrđuje složenost zadatka.

Božo Bek

In their research of visual perception many authors have created their own systems based on combination principles. Regardless of whether this was achieved spontaneously or consciously, independently or in association with collaborators, with a clear aim in view or only for the fun of seeing how the game would end, all the authors had to face the problem of combinations and of the probability calculus. Behind each visualized structure composed of a series of identical or different elements, there was always a numeric structure clearly indicating whether they were dealing with the system of permutations, combinations or variations. This enabled authors to determine quickly the exact and final number of all the structures allowed by each system. As they were dealing with great numbers as a rule (expressed in factorials or powers), the problem of selection became dominant. They had to decide not only in what order the structures would have to be arranged, but more important still, how the aesthetically relevant ones could be distinguished from the banal ones, and the most valuable ones from all the rest. Let us ask openly whether any mathematical rules have been found yet as solutions to this problem apart from the calculus of probability — any rules that would help us to formulate more accurate criteria? Or are we confronted again with the "eternal" question of the point at which Non-Being becomes Being? The experience accumulated during the last decade is considerable, but is still unexplored. At the moment, when we are all standing on the threshold of computer research, this experience may become extremely useful. Let us mention here that Almir Mavignier, probably as a result of meeting Sigrid Quarch, began a serious investigation of permutation systems in 1961, and is working at it still. Vasarely published the numerical programme of the "Boglar" painting in 1966, Enzo Mari the programme of one of his 1963 structures, while Le Parc did the same with his 1959 numerical colour system in 1970. All this led to a new analysis of their work and should now be applied to others as well. Considering the theme of this year's meeting — the rational and the irrational in contemporary art- we thought it would be useful to exhibit the works of these artists in order to stress once again the importance of the problems we have just mentioned.

The fact that some of those invited have declined the invitation, while some of those who have accepted it have abandoned the research they began in this field, only stresses the complexity of our task.

Božo Bek

kompjuterska vizuelna istraživanja

computer visual research

[The main body of the page contains extremely faint, illegible text, likely bleed-through from the reverse side of the document. The text is too light to transcribe accurately.]

Međunarodnim kolokvijem i prigodnom izložbom na temu »kompjuteri i vizuelna istraživanja« počela je godine 1968. manifestacija t-4 (tendencije 4). Ta manifestacija, koja je trajala godinu dana, ukazala je na problematiku one pojave koja se danas u svijetu naziva »kompjuterska umjetnost«, te predložila raspravu o odnosima i eventualnim vezama konstruktivističkih težnji na planu vizuelnog — što se od 1961. naziva »nova tendencija« (u SAD udomaćen je kasnije kreirani naziv »op-art«) — i vizuelnih istraživanja pomoću kompjutera. Ta rasprava, koliko god bila opravdana i logična, ipak u praksi nije donijela očekivane rezultate. Razlozi su dijelom generacijske prirode, a bezuvjetno su ovdje i zakoni potrošačkog društva odigrali primjetnu ulogu. Časopis »bit international« pratio je ta zbivanja na teoretskom području i pojedine su rasprave postavljale uvijek nova pitanja.

Zato je Galerija suvremene umjetnosti 26. i 27. VI 1971. ponovo organizirala međunarodni kolokvij na temu »umjetnost i kompjuteri«. U toku kolokvija iznesena su neposredna iskustva laboratorijskih i institutskih istraživanja, neki su znanstvenici iznijeli svoja gledišta o temeljnim shvaćanjima pojmova u oblasti umjetnosti i kompjutera, a grupa učenjaka iz Pariza (groupe art et informatique de vincennes) prikazala je referatima i zasebnom izložbom svoja istraživanja na području boja. Taj je skup donio i više preporuka koje bi valjalo iskoristiti prilikom manifestacije t-5 (tendencije 5) godine 1973. Te su se preporuke odnosile na načine i vrste djelovanja muzejskih i galerijskih ustanova, a napose je formuliran niz naslova koje će valjati obraditi. Među svim tim prijedlozima treba posebno istaknuti dva. Dr Herbert W. Franke predložio je da se proučavaju osobito mogućnosti kompjutera za stvaranje didaktičkih i pedagoških sredstava, primjenu kompjutera pri oblikovanju predmeta široke potrošnje, zatim u vezi s izgradnjom znanstvene estetike, iskorištavanje iskustava rada s kompjuterom za svrhe oblikovanja čovjekova slobodnog vremena i predmeta njegova zadovoljstva. Jonathan Benthall predložio je raspravu o odnosima konceptualne umjetnosti i istraživanja pomoću kompjutera. Posebno valja istaknuti da je cijeli skup inzistirao na nužnim sociološkim implikacijama, s jedne strane, i na izgradnji znanstvene estetike, koja uključuje i kritiku informacione estetike, s druge strane.

Organizatori međunarodne manifestacije t-5 predložili su zbog toga da temeljna teza ovaj put bude: »racionalno i iracionalno u vizuelnim istraživanjima danas«, pri čemu ona istraživanja pomoću kompjutera imaju zasebni položaj, a izbor malog broja autora s više djela treba da prezentira određena pitanja i rješenja koja se uklapaju u osnovnu tezu manifestacije. Pozvan je niz stručnjaka da načini izbor autora čija će djela biti pokazana na izložbi

The international symposium in 1968 and the exhibition on "Computers and Visual Research" organized for the occasion, marked the beginning of the event T-4 (Tendencies 4). This event, which lasted for a year, pointed to the problems of the phenomenon known today as "computer art", and proposed a discussion on the relationship and possible links between constructivist aspirations on the visual level — which have come to be known since 1961 as »New Tendencies« (in the USA the later coined name of »op-art« is in use) — and visual research by means of computers. However justified and logical it might have been, the discussion did not offer the results anticipated. We may say the reason for this is not only a problem of differences between generations and undoubtedly the laws of consumer society have also played a considerable part. The Review "BIT International" covered these events in the theoretical field and some of the discussions have raised new questions.

That's why on the 26th and 27th of June 1971 the Gallery of Contemporary Art organized another international symposium on "Art and Computers". During the symposium direct experiences, obtained through research in laboratories and institutes, were revealed. A number of scientists presented their views on the fundamental ideas in the field of art and computers, while a group of scholars from Paris (Groupe art et informatique de Vincennes) presented in their papers and at special exhibitions the results of their explorations in the field of colour. This gathering made a series of recommendations which should be utilised during the event T-5 (Tendencies 5) in 1973. These recommendations concerned the different kinds of activities of museum and galleries, and in addition a whole series of titles to be dealt with were formulated. Amongst all these recommendations two should receive special attention. Dr. Herbert W. Franke suggested that special consideration should be given to exploring the possibility of using computers for creating didactic and educational means, of applying computers for the design of consumer goods, for the promotion of scientific aesthetics, and of using experiences with computers for organizing man's leisure time. Jonathan Benthall, on the other hand, suggested discussing the relation between conceptual art and computer research. However, it should be pointed out that all the participants stressed the importance of the necessary sociological implications, on the one hand, and of the promotion of scientific aesthetics, which includes criticism of informational aesthetics, on the other hand.

Bearing in mind the above and other considerations which have not been stated, the organizers of the international event T-5 have suggested that this time the main thesis be: "the rational and the irrational in visual research to-

kompjuterskih istraživanja. Dr Herbert W. Franke predložio je ove autore: Ch. Csuri (SAD), W. Fischer (SR Njemačka), Grupo de arte y cibernética (Argentina), G. C. Hertlein (SAD), H. Kawano (Japan), K. C. Knowlton (SAD), A. Lecci (Italija), M. Mohr (Francuska), M. S. Mason (SAD), F. Nake (SR Njemačka), G. Nees (SR Njemačka), B. K. Shah (SAD), E. Zajec (Italija). J. van der Wolk predložio je predstavnike Nizozemske (L. Geurts-L. Meertens, P. Struycken, S. Brouwn), F. Briones predstavnike Španjolske, a A. Sutcliffe predstavnike »Computer arts Society« iz Londona. Galerija suvremene umjetnosti predložila je napose O. Beckmanna (Beč), V. Bonačića (Zagreb—Jeruzalem), W. Cordeira (Brazil), Cygra 4 — grupa iz Kanade, H. W. Franke, Gaiv — grupa iz Pariza, M. Horvata (Kanada), P. Milojevića (Kanada), S. Pavlina (Jugoslavija) i Z. Sykoru (ČSSR). Osim navedenih javilo se još nekoliko autora koji su svoje radove poslali samoinicijativno. Ali, kako se vizuelna istraživanja pomoću kompjutera danas neobično brzo razvijaju, a mnogi autori danas rade na drugim problemima, ova izložba ne pokazuje sve što je na tom području od 1965 — kada su održane prve izložbe djela proizvedenih pomoću digitalnih kompjutera — do danas realizirano. Isto tako ne pokazuje istraživanja kompjuterima u prostoru, zatim tzv. »events« u Velikoj Britaniji, ni djela proizvedena analognim kompjuterima ili laserima. Zadatak je izložbe prema tome da ograničenim brojem autora i ograničenom tematikom upozori na današnje stanje na području vizuelnih istraživanja pomoću kompjutera.

Zahvaljujemo svima koji su omogućili da se ova izložba realizira.

Boris Kelemen

day". In this field visual research by means of computers plays a significant part, and the choice of a limited number of artists, represented by several works, should raise certain questions and provide solutions which fall within the basic thesis of the event. Thus, a number of experts have been invited to choose artists whose works will be shown at the exhibition on computer research. Dr. Herbert W. Franke has proposed the following artists: Ch. Csuri (USA), W. Fischer (Fed. Rep. Germany) Grupo de arte y cibernética (Argentina), G. C. Hertlein (USA), H. Kawano (Japan), K. C. Knowlton (USA), A. Lecci (Italy), M. Mohr (France), M. S. Mason (USA), F. Nake (Fed. Rep. Germany), G. Nees (Fed. Rep. Germany), B. K. Shan (USA), E. Zajec (Italy), J. van der Wolk has proposed representatives of Holland (L. Geurts-L. Meertens, P. Struycken, S. Brouwn), F. Briones representatives of Spain, and A. Sutcliffe representatives of the "Computer Arts Society" from London. The Gallery of Contemporary Art has, in addition, proposed the following artists: O. Beckmann (Vienna), V. Bonačić (Zagreb—Jerusalem), W. Cordeira (Brasil), Cygra 4 — a group from Canada, H. W. Franke, Gaiv — a group from Paris, M. Horvat (Canada), P. Milojević (Canada), S. Pavlin (Yugoslavia) and Z. Sykora (Czechoslovakia). Besides these, a number of artists have sent their works on their own initiative. However, owing to the fact that visual research by means of computers is developing very rapidly today, while on the other hand a number of artists are presently working on other problems, the exhibition will not show everything that has been achieved in the field since 1965 — when the first exhibitions of works produced by means of digital computers were held — up to the present day. In the same way it will not cover computer research in space, nor the work done in the field in Great Britain and known as "events", nor works produced by means of analog computers or lasers. Therefore this exhibition sets out to show, through a limited number of artists and limited subject matter, the present situation in visual research by means of computers.

Here we would like to thank all those who have made it possible for the exhibition to be held.

La structure des oeuvres est déterminée essentiellement
par des règles de succession, du type graphes, c'est à
dire dans le plan par des contraintes de juxtaposition,
tant pour les teintes que pour les valeurs.

Jedan se put u istraživanjima sastoji u tome da prve elemente, dobivene jednostavno, shvatimo kao sadržaje koje treba prestrukturirati, kako bismo stigli na kompleksniju razinu stvaranja.

Drugi je način da ponovo programiramo analitički proces prvotno izrađenog djela i modificiramo ga prema kriterijima koje je autor unaprijed odabrao.

Robot - kist povlači na platnu trajektorije koje u funkciji neposrednog cilja — a taj nipošto ne treba postići ili slijediti — treba da ocrtaju sredinu određenu prethodnim crtama.

Njegova je paleta konstituirana od kompleksnih sastavljenih boja: probabilistička raspodjela skupa od 48 boja koje interpretira šest koloranata.

Privremena izolacija njegova stvaralačkog iskustva jest konstruktivni element prostorne organizacije djela.

Une voie de recherche consiste à considérer les premiers éléments obtenus de façon simple comme des sujets à restructurer, pour arriver à un niveau de création plus complexe.

Le second choix revient à programmer un processus d'analyse de l'oeuvre fabriquée initialement et à la modifier selon certains critères choisis à l'avance par l'auteur.

Un robot-pinceau trace sur la toile des trajectoires qui en fonction d'un but immédiat, point à atteindre ou à poursuivre, doivent contourner l'environnement réalisé par les traces précédentes.

Sa palette est constituée de composées colorées complexes: distributions probabilistes d'un ensemble de 48 couleurs interprétées par 6 colorants.

L'isolation temporelle de son experience créatrice se trouve être l'élément constructif de l'organisation spatiale de l'oeuvre.

Najprije je crno-bijela fotografija Alberta Einsteina pretvorena u raster-sliku veličine 64 puta 64 polja. Slika-informacija, kodirana na vrpci, predana je tada memoriji slika N, što su je konstruirali Hans-Jürgen van Kranenbrock i Helmut Schenk, Siemens AG, Erlangen, i podvrgnuta geometrijskim računskim procesima — površinskom računu izjednačenja, lučenju šesnaest tonova boje itd. Time dolazi do progresivne apstrakcije i pojednostavnjivanja sve do potpunog rastvaranja sadržaja slike.

Izložena djela rezultat su jednog te istog programa, nazvanog: AL, DIM. Ovaj program pisan ALGOL-om dozvoljava mi da upotrijebim »jezik« specijaliziran za konstrukciju dvodimenzionalnih koloriranih djela.

Ovaj »jezik« olakšava rukovanje i kombiniranje koloriranih objekata.

Jedan dio tog jezika (definicija) služi za iniciranje tih objekata (daje im oblik i boju), njihovu evoluciju u vremenu na osnovi kombinatorike ovisne o umjetnikovoj ili programerovoj volji.

Jedan drugi dio (utilizacija) omogućuje da pratimo ono što se događa u unutrašnjosti slike ili da slijedimo sliku po sliku, i da interveniramo za vrijeme kombinatoričkog procesa u svrhu transformiranja, redefiniranja drugih koloriranih objekata, ili pak u svrhu redefinicije pravila evolucije tih objekata.

Ovaj sustav omogućuje dakle opis koloriranih evolutivnih harmonija.

Boja je određena s pet parametara prema evolucionom procesu. Prva skala od 48 boja zatvara kromatski krug; druga, nelimitirana (skala) datost je programa, umjetnikove ili programerove volje.

Ovu skaluu pak možemo modificirati samim sustavom u svrhu usavršavanja harmonije što je on želi uspostaviti. Cilj je približavanje oblikovanju kolorirane harmonije.

Upotreba sredstva kao što je to kombinatorika ne zadovoljava u potpunosti, ali predstavlja prvi korak prema upotrebi heurističke metode osjetljivijeg rukovanja u programiranju ali koji je u većoj mjeri adaptiran kreativnim potrebama.

3 AL, DIM 3, 1973

gouache, 40 × 50 cm

computer: IBM 1130 /CII 510

Les œuvres exposées sont les résultats d'un même programme nommé: AL, DIM. Ce programme écrit en ALGOL, me permet de définir et d'utiliser un »Langage« spécialisé à la construction d'œuvres colorées en deux dimensions.

Ce »Langage« facilite le maniement et la combinaison d'objets colorés.

Une partie du langage (définition) sert à initialiser ces objets, (leur attribuer une forme et une couleur), les faire évoluer dans le temps selon la combinatoire voulue par l'artiste ou le programmeur.

Une deuxième partie (utilisation) permet de suivre ce qui se passe à l'intérieur de l'image, ou image par image, et d'intervenir pendant le processus combinatoire, pour transformer ou redéfinir d'autres objets colorés ou d'autres règles d'évolution de ces objets.

Ce système permet donc la description d'harmonies colorées évolutives.

La couleur est définie par cinq paramètres selon un procédé additif. Une première gamme de quarante huit teintes permet de recouvrir le cercle chromatique; une autre illimitée sera établie soit par le programme, soit par l'artiste ou le programmeur, en donnée.

Celle-ci pourra être modifiée par le système lui-même afin de parfaire l'harmonie qu'il essaie de construire.

Le but poursuivi est une approche de la formalisation d'harmonie colorée.

L'emploi d'un outil tel que la combinatoire n'est pas entièrement satisfaisant, mais représente un premier pas vers l'emploi de méthode heuristique d'un maniement plus délicat en programmation, mais plus adapté à une demande créatrice.

Slikovni program ARCLINK na sintaktičkoj osnovi

Razvoj na sintaksi zasnovanih opisnih shema koje omogućuju interpretaciju i prepoznavanje riječi prirodnih i programnih jezika, kao i analizu, prepoznavanje i opis vizuelnih konfiguracija, u posljednje je vrijeme postao vrlo važan s obzirom na sustave međudjelovanja čovjek-stroj.¹

Ovaj rad ne usvaja ni jedan od pragmatičkih zahtjeva koji su podlogom takvih primjena. S obzirom na svoj bitno estetički karakter, ARCLINK program ima ograničen doseg i konačna mu je svrha generiranje izvjesne vrste slika u skladu sa specifikacijama odgovarajuće formalne gramatike G.

Shema opisa slike, kako ju je uveo Alan C. Shaw² — čija opća svojstva možemo prepoznati u ARCLINK programu — definira sliku kao konfiguraciju sastavljenu od izvjesnog broja osnovnih uzoraka, čiji su međusobni odnosi zadani u obliku usmjerenog grafa.

Svaka slika ARCLINK razreda sadrži skup od n čvorova raspodijeljenih na luku kružnice.

Čvorovi su povezani osnovnim uzorcima tipa $\alpha \in P$ (luk), i to na takav način da se lukovi nikad ne sijeku i da dva ista čvora ne budu više od jednom neposredno povezani. Kako se slika razvija, graf linearne povezanosti i matrica unutrašnjeg i vanjskog polja pomažu sintaksi u izvršavanju njenih produkcija dok sve dozvoljene veze među čvorovima ne budu uspostavljene.

Gramatika generira slikovni jezik čije su »rečenice« osnovni strukturni opisi razreda slika. Osnovni strukturni opis

Syntax-based picture program ARCLINK

The development of syntax-based descriptive schemata that make possible the interpretation and recognition of strings of natural and programming languages, as well as the analysis, recognition and description of visual configurations, has recently assumed a position of vast importance in the context of man-machine interactive systems.¹

The work that I am presenting here does not share any of the pragmatic requirements that underlie these applications of syntax-based devices. Given its essentially aesthetic character, the ARCLINK program has a more limited scope and its terminal objective is the generation of pictures of a certain class, in accordance with the specifications embedded in the related grammar G.

The picture description scheme introduced by Alan C. Shaw² — the general characteristics of which the ARCLINK program reflects — defines a picture as a configuration consisting of a number of primitive patterns, which are related to one another in the form of a directed graph. The edges of the graph are the abstracted primitives labeled by their class names.

Each picture of the ARCLINK class consists of a set of n nodes distributed at regular or irregular intervals on a curve with constant radius.

The nodes are connected by primitives of the tupe $\alpha \in P$ (arc), in such a way as to preclude the intersection of arcs, as well as the repeated concatenation of the same

zadaje osnovne uzorke koji su u slici nazočni i njihove međusobne odnose.

Razredi osnovnih uzoraka

Osnovni uzorak slike je n-dimenzionalan uzorak s dvije uočene točke — glavom i repom.

Pretpostavljamo da slika ima prikladno definiranu ishodišnu točku, bilo gdje u ravnini slike.

Osnovni uzorci koji se nadovezuju na ishodište su bianco uzorci es_i i ev_i . Oni povezuju, respektivno, ishodište s početnom točkom slike i završnu točku slike s ishodištem.

Drugi razred osnovnih uzoraka sadrži nul-uzorke, kojima su glava i rep identične točke. Nul-uzorci su na slici prikazani kao označeni čvorovi.

Treći skup sadrži uzorke kojima su glava i rep različite točke. To su osnovni lukovi cn_i i dn_i negativne zakrivljenosti i osnovni lukovi cp_i i dp_i pozitivne zakrivljenosti.

Ovo je potpuni formalni opis osnovnih uzoraka ARCLINK slika:

$$T(es_i) = (\text{bianco}, ((\text{rep}_{(es_i)}), (\text{glava}_{(es_i)})))$$

$$T(ev_i) = (\text{bianco}, ((\text{rep}_{(ev_i)}), (\text{glava}_{(ev_i)})))$$

$$T(\text{čvor}_k) = (\lambda, ((\text{rep}_{(\text{čvor}_k)}), (\text{glava}_{(\text{čvor}_k)}))), \text{ gdje je } \text{rep}_{(\text{čvor}_k)} = \text{glava}_{(\text{čvor}_k)}$$

$$T(cn_i) = (\text{luk}, ((\text{rep}_{(cn_i)}), (\text{glava}_{(cn_i)}))), r, \text{ neg. zakrivljenost, vanjski}$$

$$T(cp_i) = (\text{luk}, ((\text{rep}_{(cp_i)}), (\text{glava}_{(cp_i)}))), r, \text{ poz. zakrivljenost, vanjski}$$

$$T(dn_i) = (\text{luk}, ((\text{rep}_{(dn_i)}), (\text{glava}_{(dn_i)}))), r, \text{ neg. zakrivljenost, unutrašnji}$$

$$T(dp_i) = (\text{luk}, ((\text{rep}_{(dp_i)}), (\text{glava}_{(dp_i)}))), r, \text{ poz. zakrivljenost, unutrašnji}$$

$$j, k = 1, 2, 3, \dots, n, \text{ gdje je } n = \text{ broj čvorova u slici}$$

$$i = 1, 2, 3, \dots, z, \text{ gdje je } z = (n/2) + 1$$

Gramatika

Gramatika G je kontekstno-nezavisna gramatika koja sadrži i dva kontekstno-zavisna pravila. Ta su pravila formalno definirana u produkcijama (3,4) i (5,6) i kontroliraju nadovezivanje lukova duljine dva u vanjskom polju i lukova duljine jedan u unutrašnjem polju. Unutrašnje (vanjsko) polje slike je nutrina (vanjština i rub) kruga zadanog sa čvorovima. Primjena spomenutih pravila sprečava uzastopno pojavljivanje osnovnih lukova duljine jedan i dva u njihovim respektivnim poljima.

two nodes, even if by means of arcs of different lengths. As the picture is progressively developed, a linear connectivity graph and an external-internal field matrix assist the syntax in carrying out its productions until total saturation of all available nodes.

The grammar generates a picture language, the 'sentences' of which are primitive structural descriptions of the class of pictures. The primitive structural description specifies the primitive patterns that are present in the picture and their relationship to one another.

Primitive classes

A picture primitive is an n-dimensional pattern with two distinguished points, a tail and a head.

It is assumed that the picture has a conveniently defined origin in any region of the picture plane.

The primitives that are concatenated onto the origin are the blank primitives es_i and ev_i . They connect, respectively, the origin to the starting point of the picture and the end point of the picture to the origin.

A second class of primitives consists of a set of null primitives λ , having identical head and tail points. They are represented as labeled nodes in the picture.

A third set, finally, consists of primitives with distinguished head and tail points. These are primitives on_i and dn_i with negative or clockwise curvature and arc primitives cp_i and dp_i with positive or counterclockwise curvature.

The following is a complete formal description of the primitives in the ARCLINK pictures:

$$T(es_i) = (\text{blank}, ((\text{tail}_{(es_i)}), (\text{head}_{(es_i)})))$$

$$T(ev_i) = (\text{blank}, ((\text{tail}_{(ev_i)}), (\text{head}_{(ev_i)})))$$

$$T(\text{node}_k) = (\lambda, ((\text{tail}_{(\text{node}_k)}), (\text{head}_{(\text{node}_k)}))), \text{ where } \text{tail}_{(\text{node}_k)} = \text{head}_{(\text{node}_k)}$$

$$T(cn_i) = (\text{arc}, ((\text{tail}_{(cn_i)}), (\text{head}_{(cn_i)}))), r, \text{ neg. curvature, external}$$

$$T(cp_i) = (\text{arc}, ((\text{tail}_{(cp_i)}), (\text{head}_{(cp_i)}))), r, \text{ pos. curvature, external}$$

$$T(dn_i) = (\text{arc}, ((\text{tail}_{(dn_i)}), (\text{head}_{(dn_i)}))), r, \text{ neg. curvature, internal}$$

$$T(dp_i) = (\text{arc}, ((\text{tail}_{(dp_i)}), (\text{head}_{(dp_i)}))), r, \text{ pos. curvature, internal}$$

$$j, k = 1, 2, 3, \dots, n \text{ where } n = \text{ number of nodes in the picture}$$

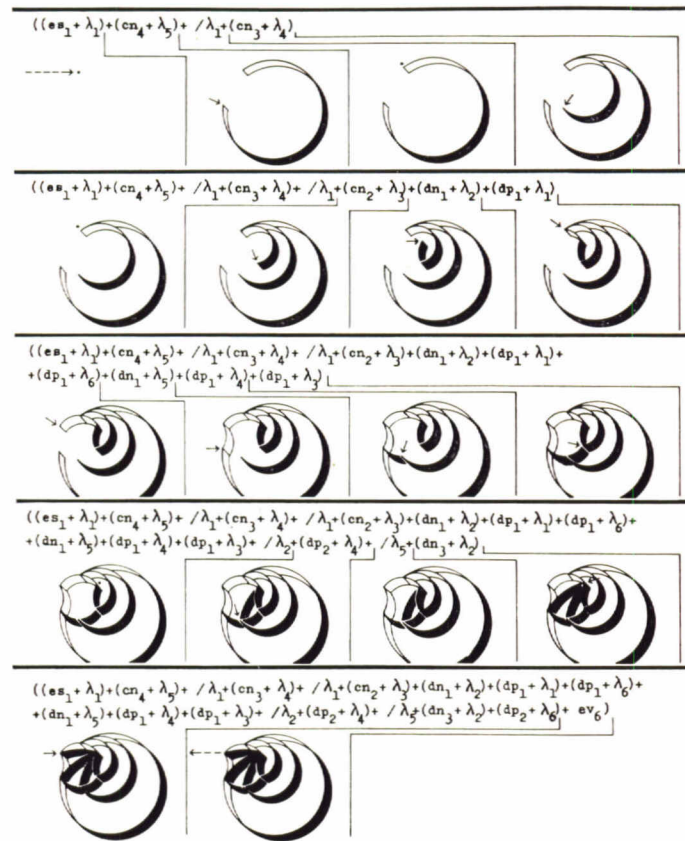

$$i = 1, 2, 3, \dots, z \text{ where } z = (n/2) + 1$$

Gramatika G je četvorka, $G = (N, T, S, P)$, pri čemu:

1. **N** je konačan skup simbola koje nazivamo ne-završnim uzorcima;
2. **T** je konačan skup simbola koje nazivamo završnim uzorcima, T i N su disjunktni skupovi;
3. **S** je uočeni početni nezavršni uzorak;
4. **P** je skup produkcija oblika ' $X \rightarrow Y_1 + Y_2 + \dots + Y_n$ ', gdje je $X \in N^*$ i svaki $Y_i \in (N \cup T)^*$.

Odgovarajući slikovni jezik PL(G) je definiran kao skup svih slika koje se sastoje samo od završnih uzoraka. Te uzorke dobijemo, polazeći od početnog simbola S, zamjenjivanjem prikladno izabranih simbola na lijevoj strani produkcije sa simbolima koji se pojavljuju na desnoj strani³.

Slijedi formalni opis produkcija gramatike G. Operatori koji se pojavljuju u ovom su slučaju binarni operator (+), nadovezivanje dvaju uzoraka, i unarni operator (/), pomičanje glave (repa) uzorka na neko drugo mjesto.

The grammar

The grammar G is essentially a context-free grammar containing two context-sensitive rules embedded in it. These rules are defined formally in productions (3, 4) and (5, 6) and control the concatenation of arcs of length two in the external field and arcs of length one in the internal field.

The external field of the picture is that part of the picture plane that is external to or coincidental with the perimeter defined by the nodes, while the internal field is that part of the picture plane that is bounded by the nodes themselves. The application of the above mentioned rules prevents the contiguous appearance of arc primitives of length one and two in their respective fields.

The grammar G is a quadruple, $G = (N, T, S, P)$ where:

1. **N** is a finite set of symbols called non-terminal primitives;
2. **T** is a disjoint finite set of symbols called terminal primitives;
3. **S** is a distinguished initial non-terminal symbol;
4. **P** is a set of productions of the form ' $X \rightarrow Y_1 + Y_2 + \dots + Y_n$ ', where $X \in N^*$ and each $Y_i \in (N \cup T)$.

The picture language PL(G) associated with this grammar is defined as the set of all pictures consisting exclusively of terminal primitives. These primitives are obtained starting from the initial symbol S and proceeding with substitutions of primitives on the right-hand side of a production for the symbol(s) conveniently selected among those that appear on the left-hand side of the production rule itself.³

The following is a formal description of the production rules of grammar G. The set of operators used in this instance consists of the binary operator (+) which brings about the concatenation of two primitives and the unary operator (/) which moves the head (tail) of the picture to a different location.

1. $S \rightarrow (es_1 + N_k) + S \mid (N_k + S \mid ev_i$
2. $ARC \rightarrow (CN_i + N_k) \mid (CP_i + N_k) \mid DN_i + N_k \mid (DP_i + N_k)$
3. $(CN_2 + N_k) + (CN_2 + N_k) \rightarrow (CN_2 + N_k) + /N_k$
4. $(CP_2 + N_k) + (CP_2 + N_k) \rightarrow (CP_2 + N_k) + /N_k$
5. $(DN_1 + N_k) + (DN_1 + N_k) \rightarrow (DN_1 + N_k) + /N_k$
6. $(DP_1 + N_k) + (DP_1 + N_k) \rightarrow (DP_1 + N_k) + /N_k$
7. $CN_i \rightarrow cn_i$

Linearno-komplementarni raspored

Sergej Pavlin — autor

Borut Dobobišek — programer

Zdene Briška — programer

Studija emotivne i fiziološke registracije boja, analitička obrada više od 1400 kombinacija i empirički obrađena teoretska shvaćanja čimbenici su koji prethode linearnom programu. Sistematika boje u krugu već je poznati rezultat idealnog horizontalnog presjeka teoretskog obojenog tijela. Međutim, međusobni su valeuri nejednako tretirani, jer je raspored boja prema centru kruga geometrijski manji. Vizuelna valorizacija je svakako primjerena praksi, ali ako uzmemo u obzir nedostatke rasporeda u krugu, vidimo da on ne predstavlja idealnu formu za tretman ekvivalentnih ploha. Ako apliciramo boju u linearnom rasporedu, izbjegavamo dileme i ostajemo vjerni spektru koji je prirodno linearan, definiran valnom dužinom i logičan za programsku obradu.

Pojedinačni valeur boje mogao bi se podijeliti na N dijelova (N je varijabilan) i time se dobiva broj saturacija za svaki valeur S. Segment presjeka mogli bismo zamisliti kao trokutnu plohu koja daje bazične podatke saturacije. Takav segment ($1 \leq i \leq G$) je podijeljen između (B, Si) Mi i (Č, Si) Li u raster romboida od kojih svaki može dati

linear complementary order

by Sergej Pavlin

Borut Dobobišek, programer

Zdene Briška, programer

A study of colour-emotional and physiological perceptions — an analysis of over 1400 colour experiments and empirical results, which have been processed and modified to the theoretical conception, are factors of the program which are not looking for a colour order in a circle but rather in a linear colour order resulting from uniformed program efforts. In the general theoretical findings on colour elements the colour circle is always presented as the ideal profile, although there are spatially unequal spans among the shades.

Since visual colour proportions are to be practically used, there is no consistent spread of colour in the circle because of its geometrically inconsistent proportions. There is no such problem in the case of linear colour division in which the specter remains an ideal; linear shape is also suitable for practical use and for program processing.

In shaping the program basis of colour cuts N, the colour cut is symmetrical, however, in respect to the whole, it

određeni stupanj boje Si. Parametri Mi i Li određuju broj upotrijebljenih ploha boje Si u odnosu prema bijeloj i crnoj. Čim je određen presjek, dobivamo i koordinate.

Linearna formalizacija tretira ekvivalente boja jednako-vrijedno, a to je uvjet za sistematiku.

Empirički rezultati obuhvaćaju također valorizaciju ploha i izraženi su formulom:

$$C_y = (110 - C_x) \frac{A_x}{A_y}$$

$$W = \frac{(100 - C_y)}{(100 - C_x)} W_x$$

(B = crna)

W = bijela

Cy = boja y

Cx = boja x (komplementarna valorizacija)

Kompilativnom obradom podataka i empiričkom dogradnjom eksperimenta moguće je u daljnjoj sekvenciji obratiti pažnju i psihološko-fiziološkim faktorima. Upotrebom kompjutera problem je postao aktualan.

kompjuter: siemens 4004

Design-institut iz Münchena razradio je stambenu i gradsku strukturu od kubo-oktaedra čije mnogostruke mogućnosti primjene dopuštaju najraznovrsnija rješenja s po-

becomes so large that it can take over all intermediate proportions, can be compact or can remain blank.

Each colour value can be divided into N parts. N is, therefore, a variable, as is the number of colour cuts of the colour shade S. Each segment is forming a triangle surface ($1 \leq i \leq G$) which is divided among (B, Si) Mi and (Č, Si) Li into a network of rhomboids, each one being an individual shade of the basic colour Si.

Parameters Mi and Li determine the number of shades of the basic colour Si against the white and black colour — the extreme visual units for the analysis of the colour cut. The moment the colour cut is determined, it also gets its coordinates.

The suggested organization eliminates primary dilemmas and determines colour proportions equally. This brings up a systematic arrangement.

Such compilations and empirically gained solutions relate, in special sequence, to colour, surface and psychological-physiological reactions. These problems were raised with the use of computers.

The Design Institute in Munich has developed the structure of a living unit and a city out of "cuboctahedra" whose multiple uses permit a great variety of solutions for the problems of city planning. The structure of the living-units makes it possible for the inhabitants to modify

dručja urbanizma. U toj stambenoj strukturi stanari mogu jednostavnim sredstvima mijenjati i proširivati stambeni prostor. Sada je zadatak da se ti stambeni elementi sastave kako najbolje odgovara prostornom planu. Rješenje možemo dobiti pomoću kompjutera, s tim da svaka prostorna jedinica može imati različite funkcije: funkciju kupaoalice, sanitarnog čvora, kuhinje, blagavaonice ili dnevnog boravka, spavaonice. Pojedine prostorne jedinice programiraju se prema jednom »atomarnom modelu«. Svaka se prostorna jedinica može promatrati kao atom koji ima najraznovrsnije funkcije; vezne valjanosti dopuštaju spajanje pojedinih stambenih jedinica u stambene molekule. Prostorna predodžba koju iziskuje takvo planiranje osjetno nadilazi predodžbene mogućnosti projektanta. Uz pomoć kompjutera mogu se vizualizirati točna rješenja i postaviti optimalne prostorne grupe. Uređenju tih novih stambenih struktura — koje, za razliku od trenutačno modernih kubnih betonskih blokova, pružaju mnoštvo mogućnosti za formalne varijacije — bitno mogu pridonijeti kompjuterski dizajnirani namještaji i tekstili.

and expand their living quarters in various simple ways. The problem is to find the most favourable composition of the living-units in relation to the available space structures. The solution is found with the aid of a computer since each space-unit can fulfill different functions such as the function of a bathroom, a toilet, a kitchen, a dining-room, living-room or bed-room. The programming of each of these unit functions is done on the basis of an "atomic model". Each module is regarded as an atom which may fulfill a great variety of functions; with the aid of certain combination priorities the number of living-units can be combined in one single living molecule. The spatial view required in this sort of planning by far surpasses the designer's powers of mental visualisation. With the aid of computers, however, the proper solutions can be visualised so that optimal groups of living-units result. For the furnishing of these new living-structures which, in contrast to the currently fashionable cubic blocks of concrete, can be combined in a great variety of different shapes, computer-designed furniture and textiles may acquire considerable importance.

konceptualna umjetnost

conceptual art

Kad se u katalogu Novih tendencija 2 pokušala godine 1963. definirati situacija na području plastičkih umjetnosti, naglašeno je da »materija više ni u kom slučaju nije nosilac nekih deskriptivnih vrijednosti a nisu već ni njezine posebne karakteristike prikladne da ponesu glavnu ili koju istaknutu temu djela i zato su boje konačno ugasile. Draži slučaja u toku izvedbe više nije poželjna i cijelo je svoje mjesto ustupila maksimalnoj tehničkoj čistoći i točnosti pa stoga sama izvedba i nije u rukama autora ideje ili projekta djela nego se ostvaruje u radionici specijalista ili u tvornici.« Ako se zapravo u tom trenutku još nalazimo isključivo na području materijalnog i vizuelnog, i tim se riječima pokušala definirati orijentacija sljedbenika Novih tendencija, izneseni su neki momenti koji će koju godinu kasnije izvan Novih tendencija dovesti do potpunog dokidanja umjetničkog djela kao nosioca deskriptivnih ili sličnih vrijednosti, nosioca neke tematike, a u prvi plan će biti stavljena sama ideja ili projekt. To postobjektno odnosno postvizuelno shvaćanje opredijelilo se samo za jednu stranu stvaralačkog procesa umjetnika — formiranje ideje, dok je uistinu tehnička realizacija dokinuta a imaginarna se predodžbena realizacija ostvaruje u primaocu poruke. Kako je time dokinuta materijalna objektivizacija djela, ne može se više govoriti o njegovim vizuelnim estetskim kvalitetama, nego vrlo često sam jezik postaje materijal umjetnosti. Budući da je u isto vrijeme kao sastavni dio vrijednosti djela uključeno i objašnjenje njegove svrsishodnosti, konceptualna umjetnost odbacuje mogućnost njegova daljnjeg kritičkog vrednovanja, preispituje samu sebe a takvim metalingvističkim ispitivanjem ispituje samu umjetnost. Izoliranjem umjetnosti od materijalnog predmeta i preuzimanjem konceptualnih jezika nauke, vrlo često matematike, umjetnost nastoji prijeći granice koje su postavljene između nauke i umjetnosti. Zapravo, nestajanje vizuelnog na umjetničkom području paralelno je s upravljanjem aperceptivnim procesima na području nauke, i dio konceptualnih umjetnika ne vidi umjetnost samo kao ideju nego i kao znanje. Prelaženjem s izrazito vizuelnih aspekata djela na misaone i pridavajući im onu važnost koju imaju naučne discipline, konceptualna je umjetnost odredila sebi i ulogu umjetničke teorije. Ali kao što se među naučnim disciplinama postepeno počinju gubiti izričite granice, tako granice nestaju i između umjetnosti, lingvistike i filozofije. Od siromašne umjetnosti nadalje cjelokupnoj se stvarnosti nastoji dati vrijednost umjetnosti i pojam umjetnosti proširiti na cjelokupni prostor, na totalnost života — život je umjetnost, umjetnost je život. Djela umjetnika konceptualista lišena su mitskog, simboličnog, ne traže i ne daju tumačenja izvan samih sebe, ne govore o stvarima izvan sebe — poruka je djelo samo. Stara težnja da publika sudjeluje u kreaciji umjetničkog

When in 1963 the attempt was made in the catalogue of New Tendencies 2 to define the situation in the field of visual arts, the following point was stressed: "matter is by no means any longer the bearer of particular descriptive values and neither are its distinctive features appropriate any longer to carry the main or one of the main themes of the work and this is why colours have finally faded away. The charm of the accidental occurrence in the course of execution is no longer desirable and it has ceded its place to maximum technical perfection and precision; therefore execution itself is no longer in the hands of the creator of the idea or the design of the work, but is realized by specialists in workshops or else in factories." Let us presume that at that time we were still exclusively involved in the material and visual sphere; so with these words we tried to define the orientation of the followers of New Tendencies, and certain new factors were delineated which, in a year's time brought about a new situation, not falling within the scope of the New Tendencies, and in which the work of art no longer carries descriptive or any other kind of similar value; it no longer carries a theme; primary importance is given to the idea or to the design itself. This post-object, i.e. post-visual view covers only one side of the creative process of the artist — the formation of the idea, while the actual technical elaboration has been set aside and the imaginary conceptual realization is achieved by the receiver of the message. Owing to the fact that at the same time, an explanation of the usefulness of the work is included as an integral part of its value, conceptual art denounces all possibility of a further critical evaluation of the work, but it re-examines itself, and through such metalinguistic investigation it explores art itself. By isolating art from the material object and by taking over the conceptual languages of science, often that of mathematics, art strives to overcome the boundaries which have been set up between science and art. Actually the disappearance of the visual in the field of art is correlative with the controlling of imperceivable processes in the field of science and even among conceptual artists there are those who do not see art only as an idea but also as knowledge. By passing from the purely visual aspects of the work to the mental aspects and by attaching the same importance to them as that attached to scientific disciplines, conceptual art has set out to play among other roles the role of an art theory. However, just as the precise boundaries between scientific disciplines are slowly disappearing, so the boundaries between art, linguistics and philosophy are also disappearing. Efforts are being made, starting from land art onwards, to give the whole of reality the value of art and to spread the idea of art to the whole of space, to the whole of life — life is art, art is life. The works of conceptualist artists are free

djela ili njegovoj nadgradnji ovdje ima priliku da se ostvari. Konceptualno djelo-ideja može se u svijesti primaoca razvijati dalje na temelju njegova prijašnjeg iskustva, sjećanja, imaginacije i vlastitih intelektualnih sposobnosti. Takvom percepcijom, bez obzira na to je li riječ o realnom ili konceptualnom postojećem predmetu, percepcija stvarnosti i ambijenata koje svakodnevno sve manje zapažamo može postati izoštrenijom. Kada kod konceptualne umjetnosti govorimo o djelu, govorimo o ideji čija forma prezentacije s estetskog stajališta nije bitno važna, ali kako ona kao poruka mora biti komunicirana, mora biti i opredmećena u nekom materijalu. Materijal koji konceptualni umjetnici upotrebljavaju kreće se od najklasičnijih: platna do najnovijih: kseroksa i videotepa. Iako su zapravo u svom antimaterijalnom, antivizuelnom shvaćanju i antikomercijalnim težnjama u počecima vrlo radikalno odbacili klasične načine izražavanja i komuniciranja, a sada se nekima i vratili iz različitih razloga od kojih je vjerojatno komercijalni najprimarniji, ova izložba započinje sekcijom platno kako bi se pokušalo ustanoviti koliko ideja-koncept može biti relevantna za spoznaju i otkrivački karakter umjetnosti bez obzira na to kojim se sredstvima prenosila. Nove su tendencije često kao i konceptualna umjetnost iznosile misao da »pojam umjetnosti mora pretrpjeti odlučnu promjenu i izbrisati se kao takav« (Katalog nova tendencija 2), da umjetnost mora pretrpjeti nužnu scijentifikaciju te da se postavlja pitanje njezine svrhovitosti. Trebalo bi stoga ustanoviti koliko postoje ili ne postoje drugi zajednički momenti, koliko je pozitivno ili negativno odvajanje koncepta od produkta, stvaraoaca od realizatora na svim područjima umjetnosti gdje do takvog razdvajanja dolazi.

Marijan Susovski

from mythical, symbolical elements; they do not seek to give and do not give explanations extrinsic to those contained in the works — the message is the work itself. The age-old aspiration to have the public participate in the creation of a work of art or in its build-up now has a chance of being achieved. The conceptual work — the idea can further develop in the consciousness of its receiver on the basis of his earlier experience, memories, imagination and his own intellectual capabilities. Through such a perception, regardless of whether it be a question of a real or conceptually existing object, the perception of reality and of the environment, which we tend to notice less and less in our everyday life, can become keener. When, in talking about conceptual art, we refer to the work, we are actually referring to the idea whose form of presentation from the aesthetic point of view is not of great importance; however, as we have to communicate it as a message it must be materialized in some way. The material which conceptual artists use ranges from the most traditional kind — canvases — to the most recent kind — xeroxes and videotapes. Although the artists in their anti-material, anti-visual attitudes and anti-commercial aspirations, have from the very beginning radically denounced the traditional ways of expression and communication, and though some of these have been used again for various reasons (the most important being commercial consideration), this exhibition opens with a section of canvasses so as to try and establish to what extent the idea-concept can be relevant to the understanding and to the revelational character of art regardless of the means by which it is communicated. The New Tendencies, like conceptual art, often stated the idea that "the notion of art will have to undergo a crucial change and be done away with as such"; that art will have to undergo the necessary scientification and the question of its usefulness will have to be raised. It should therefore be established to what extent other common factors exist or do not exist, to what extent a positive or negative separation exists between the concept and the product, the creative artist and the implementor in all those fields of art in which such a separation occurs.

London

Osamnaest manekena snimano je kroz izlog robne kuće u Oxford Streetu u vremenskim razmacima od dvije minute. Neposredno nakon svakog snimljenog manekena umjetnik se okrenuo i na ulici snimio prvu osobu koju je ugledao a bila je istog spola kao i upravo snimljeni maneken, uspoređujući tako kopiju stvarnosti sa živim predloškom.

Kontaktne dokazne kopije i dvanaest fotografija koje pokazuju šest uspoređenja pridruži ovoj izjavi da tvore formu ovog djela.

Variable Piece # 104

London

Eighteen mannequins were photographed at two minute intervals through the windows of clothing stores on Oxford Street. Immediately after each photograph was made, the artist turned and photographed the first person that he saw who was of the same sex as the last mannequin photographed thereby juxtaposing a model of reality with a real life counterpart.

A contact proof print and twelve photographs that demonstrate six juxtapositions join this statement to constitute the form of this piece.

exhibiting since 1968

address: kolašinska 12, 24000 subotica, yugoslavia

1 creation and examples, 1973

100 colour slides

The hundred colour slides represent the artist's works from 1972/73. They cover the fields of creative investigation dealt with in the passage from the study on the artist entitled "Introduction to the Artist's Works, 1973" and published in the T-5 series. They present signs, objects, phenomena and situations. The pictures were taken in Subotica in 1973 and partly in Novi Sad in 1972. Following the artist's instructions, Zoltan Apro from Novi Sad and Laszlo Kerekes from Subotica took the shots on Agfa Dia-Colour and Orwo-Chrom films. The photographs are the property of the artist/exhibitor.

Ovo nije niti bi trebalo da bude izložba antologijskih primjeraka konceptualne umjetnosti koja se u posljednjih nekoliko godina potvrdila kao najdosljednija neestetska i antiformalna umjetnička praksa u povijesti. Naprotiv, objavljena selekcija imala bi biti odlučnom korekcijom jedne zablude. Danas, nakon 6—7 godina otkako postoji taj način kreativnog mišljenja u svim krajevima svijeta, kad je informacija o takvom umjetničkom djelovanju odavno već prešla granice specijaliziranih časopisa i nekoliko malobrojnih pionirskih galerija, široko je pustila korijenje zablude. Nikada ne prihvativši zaista, zbog inertnosti ili dogmatizma, bazične premise konceptualne ideologije, većina publike, a i profesionalno uključених promatrača (galerista, teoretičara, organizatora), jednostavno je odjenula u novo ruho i primijenila principe stare formalističke metodologije na proizvode nove umjetnosti. Mehanička primjena starih vizibilističkih metoda na neprimjerenu im novonastalu kvalitetu uzrokovala je identifikaciju konceptualne umjetnosti s njenim sredstvima prezentacije. Paradoksalno, umjetnički postupak, koji operira s izvanplastičkim i izvanpojavnim sredstvima, postaje predmetom istraživanja. Tako je, zbog predrasude da se s djelom komunicira isključivo vizuelno, tehnologija konceptualne umjetnosti (fotografski predlošci, sheme na milimetarskom papiru, tekstovi tipkani strojem) preuzela dojučerašnju ulogu estetskog.

Bitan je uzrok toga nesporazuma, uz ostalo, i priroda komercijalnog sistema koji je i ovaj put uspjeh nove umjetnosti ostvario pomoću prepoznatljivosti stanovite forme. Bilo je, dakle, prijeko potrebno osigurati prepoznatljivost »koncepta«. Forme konkretizacije »koncepta« u objekt pogodan za prodaju i prisvajanje čine značajnu stranu toga fenomena, koja bi morala biti predmetom posebne studije. Oblik prodaje konceptualnog djela sada je konstitutivni dio djela samog (a ne više samo posao trgovaca), s povratnim djelovanjem na uspjeh kreativnog rješenja. U najsigurnijim su slučajevima stvarna i prodajna forma djela organska cjelina¹, nasuprot mnogobrojnim primjerima gdje je akt prodaje nasilna povreda autohtonosti djela, koje je samo po sebi neotuđivo². Nikada dosad komercijalna komponenta nije toliko zadirala u idejnu autonomiju djela; posjednički zahtjevi tržišta našli su se u kontradikciji s pokušajima »dematerijalizacije umjetničkog objekta«.

Smisao je tih napomena o problemima, koji sigurno zaslužuju temeljniju analizu, upozorenje da upotreba »nelikovnih« materijala (dijapozitiva, videotrake, papira A₄) ne imunizira rezultat od opasnosti samonegacije, niti osigurava »konceptualnost« ostvarenja. Naprotiv, identifikacija novoga govora sa sredstvima bilježenja pogoduje maniriz-

This is not, nor need it be, an exhibit of selected samples of conceptual art which in the last few years has become the most consistent non-esthetic and anti-formal art practice in history. On the contrary, this selection is meant to correct a certain fallacy. For six or seven years now this manner of creative thinking has been spreading into all parts of the world and today, when information about this type of art activity is no longer limited to specialized periodicals and a few pioneer galleries, a fallacy has taken deep root. Never really accepting the basic premises of conceptual ideology, either because of inertness or dogmatism, most people, and those professionally involved as well (theoreticians, organizers, art dealers), have simply altered the form, but not the essence, and applied principles of old formalistic methodology to the products of this new art. Mechanical application of old methods of perception to this new quality caused conceptual art to become identified with its means of presentation. Paradoxically, an art procedure which is basically non-formal and non-visual has become identified with a particular form of presentation. Because we are accustomed to a work of art communicating only visually, the technology of conceptual art (photographic prints, diagrams on graph paper, typed texts) has subjugated yesterday's role of the esthetic.

In addition those already mentioned, one of the basic reasons for this misunderstanding is the nature of the commercial system which, in this case too, insured the success of conceptual art through recognition of a particular form. Thus, it was necessary to guarantee the recognition of a "concept". The ways in which this "concept" was concretized into a recognizable object, suitable for sale, make up a significant part of this phenomenon, a part which should be a subject of special study. The way in which the conceptual work is sold is now a constituent part of the work itself (and not anymore the job of art dealers alone) and repeatedly influences the success of the creative solution. In the most ideal cases, the real and sale forms of the work are an organic whole¹, contrary to numerous instances where the act of selling is an encroachment on the autonomy of the work which is in itself inalienable². Never up until now has the commercial component so encroached upon a work's autonomy; the possessive demands of the art market have contradicted the attempts to "dematerialize the art object". The purpose of these notes on problems, which certainly merit more detailed analyses, is to demonstrate that the use of what up until now have been "non-art" materials (slides, videotapes, graph paper) does not protect the result from the danger of self-negation, nor does it insure a work's "con-

mu svih vrsta, jer omogućuje svakoj ispraznoj i plitkoj dosjetki, izvedenoj u nekom od priznatih medija (fotografija, video, film), počasni naslov »avangardizam«. Kao i dosad kad se ideologija počinje miješati s tehnologijom, najviše koristi imaju zakašnjeli eklektičari. Ne može se osporiti da su tehničke inovacije pogodovale suvremenom načinu izražavanja, ali ne treba započinjati staru priču o kokoši i jajetu jer, da nije bio ostvaren novi odnos prema entitetu umjetnosti, ni video, ni xerox, ni bilo koje od sličnih sredstava ne bi se našlo na spisku umjetničkih alata.

Taj novi odnos najizravnije se očituje u izmijenjenoj funkciji umjetničkog objekta; ne postoji više objekt kao estetski predmet, nego kao pokazatelj složene funkcije koja djelo jest. Put oslobođenju od estetskog predmeta nije u izlaganju u zaključanoj galeriji, ni u svođenju dimenzija spomenika na format A₄ papira, nego u odumiranju dominacije vizuelnog u djelu, u korist raznovrsnih poruka koje ono sadrži. Estetski objekt jučerašnjice nudio je sve podatke svojom pojavnošću, i zahvaljujući tome mogli su se jednako arbitrarno, uz pomoć formalne analize, vrednovati crteži iz Lascauxa i slike Olitskog. Intencije i ideološko stajalište umjetnika (ako se o njima išta znalo) bili su samo ne odviše značajna pomagala u tumačenju djela, čije su primarne odrednice bile uvijek njegove morfolozijske odlike.

Iz te dominacije oblika nad suštinom proizlazi i shvaćanje kategorije »apstraktnog« u umjetnosti koja se nužno postovjećuje s odricanjem mimikričkog, na putu sve većoj minimalizaciji plastičkih sredstava izražavanja. Ali apstrakcija nije forma prezentacije nego sistem mišljenja, pa apstraktnost djela ne proistječe iz pojednostavnjenja vizuelnog predloška nego iz množine nevizuelnih, misaonih poruka koje taj oblik sadrži.

Po toj se definiciji na jednakom stupnju apstraktnosti mogu naći figurativna slika, brončana skulptura i tipkani tekst ako su praćeni potrebnim kvantitetom misaonih implikacija, koje nisu nužno uvjetovane njihovim obličjem.

Razlozi su posebnog apostrofiranja radova izvedenih s platnom, materijalom koji nepogrešivo asocira na najtradicionalniju slikarsku tehniku, u vjerovanju da aktualnost umjetničke misli ne ovisi o izboru tehnike nego o novom pristupu realnosti.

Nena Dimitrijević

ceptuality". On the contrary, identification of a new language with means of notation favors a mannerism of all sorts, for it permits every shallow and uninventive idea, executed in a recognized medium (photography, film, video) the honored title of avantgardism. As in the past, when ideology starts to be mixed with technology, eclecticians profit the most. One cannot dispute that the technical innovations favored a contemporary manner of expression, however, there is no need to go into the story of what came first — the chicken or the egg, for if a new attitude had not been established with respect to art as a whole, neither Video, nor Xerox, nor any similar means would be included on the list of art tools.

This new attitude can be best seen in the changed function of the art object; the object no longer exists as an esthetic subject, but as the indicator of a complex function which is the work. Exhibiting a closed gallery or reducing the dimensions of a monument to the format of a piece of typewriter paper is no way to free the art object from the status of an esthetic subject. Rather, it must come about by deemphasizing the visual aspect of the art work in favor of the message or messages contained in the work. Yesterday's esthetic object communicated information through its appearance, so that the drawings of Lascaux and paintings of Olitski could be evaluated with equal arbitrariness by methods of formal analyses. The intentions and ideological premises of an author or of an entire movement (if at all anything was known about them) were only insignificant instruments in explaining the work whose primary determinants were always its morphological traits.

From the domination of form over essence also comes the understanding of "abstraction" in art which is necessarily identified with a denial of mimicry and an increasing reduction of formal means of expression. However, abstraction is not a form of presentation, but a system of thinking, so that a work's abstraction does not result from the simplification of the visual basis, but from the multitude of non-visual mental messages contained in that form.

According to this definition, a figurative painting, bronze sculpture and typed text may all be found on the same level of abstraction, inasmuch as they are accompanied by the necessary quantity of mental implications which are not necessarily stipulated by their forms. The reason for special emphasis on works executed on canvas, a material which is unmistakably associated with traditional painting techniques, is because of the belief that the actualness of an artistic thought does not depend on the choice of technique, but on a new approach to the existing reality.

... upiše se matematički program sastavljen od 18 parametara koji se međusobno mogu vezati. Tok proračuna transformira se u linearne elemente koji se vide na ekranu.

Promjenom parametra mogu se linearni elementi, koji se pojavljuju na ekranu, najrazličitije varirati i modificirati. Tako je već i u toj generativnoj fazi omogućena selekcija prema estetskim uvjerenjima.

Objekte koje smatramo dobrima nacrtata tada kompjuterski upravljani plotter.

... es wurde ein mathematisches Program geschrieben, das aus 18 miteinander verbindbaren Parametern besteht. Der Rechnungsvorgang wird auf einem Bildschirm in lineare Elemente transformiert und sichtbar gemacht. Durch Veränderung der Parameter lassen sich die auf dem Bildschirm erscheinenden linearen Objekte in vielfältigster Weise variieren und modifizieren. So ist auch schon in dieser generativen Phase die Steuerung und Selektion nach ästhetischen Gesichtspunkten in hohem Masse möglich.

Die für gut befundenen Objekte werden dann auf einem vom Computer gesteuerten Plotter gezeichnet.

Kad radimo kompjuterom (bila to »umjetnost« ili obična tehnika grafičke prezentacije), radimo sredstvom kojega je najveća kvaliteta preciznost informacije. Postavlja se pitanje — informacije o čemu? A to znači veći intelektualni napor koji se promatraču isporučuje putem grafike. Znači: grafika je informacija o tome što je autor rada mislio i napravio. Uloga je grafike da to prenese i zabilježi.

In the architectural design we see the role of computer graphic essentially as an information. It is far more precise than anything hand made. It also has a rich mathematical content, on the basis of which logical inferences can be drawn for the successive design stages. We do not believe in a specific category, usually referred to as computer art. Art can only be man made. If the nature of the work of art is such that it requires an accurate means of expression, that is if the precise information is important, then the computer is
