an egg cASE ESCAPE MECHANISM.

Test for
freshness:
Put the egg
in tap water
three times its
depth. If it sinks,
wonderful. If the
larger end lifts it is
not fresh. The higher
the egg floats the older
it is.

Time Table for eggs
cooked in their shell:
covered with water, soft
boiled, 212° F, 2 min.;
medium boiled, 212° F, 3 min.;
coddled, 180° F, 5 to 8 min.;
hard cooked, 212° F, 10 to 20
min. Low temperature cooking
prevents tough egg whites and
keeps hard cooked yolks from

min. Low temperature cooking
prevents tough egg whites and
keeps hard cooked yolks from
turning green around their edges.
Salted water will stop leakage in
the case a shell cracks.

Different species of birds lay different amounts of eggs each year. The large condor lays one egg a year. Many wild birds lay between 4 and 8 a year; some as many as 20. Domestic birds, ducks and chickens, can lay 350 or more each year.

Eggs laid in holes in the ground or in sheltered places are usually white. Uncovered nests and those above the ground contain colored and spotted eggs that blend with their surroundings.

Most infant birds have an egg tooth, a little hard knob at the end of their beaks that is used to crack the shell so that the young can wriggle out.

Different species of birds spend different amounts of time in their nests before they test the world. Some species of birds never fly, others learn and finally become outstanding flyers.

finally become outstanding fliers.

The image shows a dense, abstract word cloud composed of various English words. The words are arranged in a roughly triangular shape, with 'feeling' at the top left and 'flesh' at the bottom right. Other prominent words include 'heart', 'skin', 'cheek', 'course', 'assess', 'biting', 'wander', 'empty', 'hold', and 'asleep'. The words are written in a variety of sizes and orientations, creating a textured, organic appearance.

Love at first sight / Scott Helmes
