FOREWORD

This extraordinary oral history of the African-American experience at MIT has a transcendent value to those interested in American higher education, and indeed the American experience. The volume sets before us the challenges, triumphs, and failures of a great research university as it has grappled with its role in bridging the racial divides that continue to plague our nation.

This book is in many ways an important companion to *The Shape of the River*, the detailed study of the long-term consequences of considering race in American college and university admissions, written by William G. Bowen and Derek Bok. Clarence Williams's volume presents us with individual human experiences that lie beneath statistical studies, such as those undertaken by Bowen and Bok.

The story is told through reflective interviews with African-American graduates of MIT, and with academic and administrative leaders of the university, whose experiences span several decades. Broadly, the story is one of success. Indeed, some of these graduates have become great leaders of our society, including the Secretary General of the United Nations and the president of a major university. Others are young and just establishing their careers. All are contributing their talents in important ways to our nation and world. Each expresses the importance of the rigorous and demanding education they received at MIT.

But the story is not entirely positive. The memories of student days are often bittersweet, reflecting a variety of burdens and unhappy personal experiences that call vividly to our attention the asymmetries of experience of many minorities in our culture—even in our finest institutions. It is also clear that each of these graduates had to draw

on a high degree of inner strength and commitment to excel.

Finally, the story is one of leadership by students and by academic administrators who enabled the MIT student body to become remarkably diverse. But the struggle continues to this day, because the diversity of our faculty—and of most faculties across the nation—still fails to match that of our students. The wonderful successes in personal and professional life of the graduates interviewed for this book provide the strongest possible motivation to continue this quest.

Ever present in this book is the strong but quiet presence of its editor and author, Clarence Williams. I am proud to claim as a colleague and friend this man who has done so much to help both individuals and our institution achieve the successes chronicled here, and to guide us toward meeting our continuing challenges.

Charles M. Vest
President
Massachusetts Institute of Technology

ACKNOWLEDGMENTS

No one person can produce a book such as this without the diligent work and support of a great many people, only a few of whom can be acknowledged here. First of all, I must thank MIT for granting me the major support to complete this book. For the most part, this book is the result of dialogues with MIT constituents—on campus and across the country—about their perspectives on the MIT black experience extending over a 50-year period. And, of course, it would have been quite unattainable without the help of friends and associates.

The idea for the project came out of a discussion with my friend and a mentor, Paul E. Gray, a former MIT president and Chairman of the Corporation, to whom I am profoundly indebted for his support of the idea in its early stages and for providing the initial funding for its start-up. President Charles M. Vest must be acknowledged for his support in so many ways, including his early involvement, continued strong commitment, wise counsel, and advocacy for this project. The progressiveness and sincerity of these two superb academic leaders regarding race matters so vividly expressed in their precious impressions and observations in this book can be fully appreciated by all who work tirelessly to make institutions of higher education a better environment for all of our students, faculty members, and staff of different racial and cultural backgrounds.

I am very thankful for the financial support of the Carnegie Corporation of New York for this work. My deep appreciation is extended to the MIT black graduates for their financial support, especially Patrice A. Nelson, Napoleon Nelson, and Gerald Baron.

My foremost gratitude goes to the present and former black students, black and non-black

faculty members, and administrators who unselfishly shared their rich MIT experiences. Their reflections on their family backgrounds, role models and mentors, experiences of racism and race-related issues, and the MIT experiences will serve as invaluable resources for our society. All citizens who desire to increase the numbers of black and other underrepresented minority scientists, engineers, social scientists, and quantitative-based professionals can benefit from this book. I am truly grateful for their recollections.

I wish to thank the alumni and current and former MIT faculty and staff who contributed valuable historical information and insights. Among this group are Glenn P. Strehle, Loretta Mannix, Jay W. Forrester, Anthony P. French, Frank Perkins, William N. Locke, Morris Halle, George Condoyannis, Robert Pinckney, and Lotte Bailyn.

I am forever grateful for the exceptional group of students who assisted with historical research and oral history transcription, especially Adam C. Wilson, Kira M. Huseby, Hope M. Barrett, Anna P. Orenstein-Cardona, Tanisha L. Lloyd, Keith V. Bevans, and Jeremy D. Sher. Others involved in this effort include Shannon L. Anderson, Debra T. Whitbourne, Jonora K. Jones, Taalib-Sheldon N. M. al 'Salaam, Daniel S. Berger, Jennifer K. Johnson, Stacy Betz, Andy W. Su, Muhammad Abdus-Sabur, Kevin J. Lee, Desiree L. Ramirez, Bianca Gomez, Diana V. Albarran, and Veronica Garcia.

I also wish to thank the current and former staff and students who worked on a survey for the black alumni, both in developing the instrument and in compiling and analyzing the data, especially Nancie M. Barber, Richard Duffy and Jeremy D. Sher; also, Judy Jackson and Leonard Kimble.

I must not overlook the numerous MIT offices and units—current and former staff—that made available precious historical information and data including rare photos and archival materials for this book. These groups included the Institute Archives and Special Collections. Special thanks go to current Elizabeth C. Andrews, Lois N. Beattie, J. Darcy Duke, Elisabeth Kaplan, Donna E. Webber, Jeffrey A. Mifflin, Mary Eleanor (Nora) Murphy, Ewa Basinska, Helen W. Samuels, Margaret dePopolo, and Megan Sniffin–Marinoff. In the MIT Museum, I am appreciative to Warren Seamans, Michael W. Yeates, Kara Schneiderman, Jennifer L. O’Neill, Louann Drake Boyd, Joan Parks Whitlow, and Jane Pickering. I offer my thanks to both former and present Vice Presidents for Human Resources and Equal Opportunity Officer, Joan Rice and Laura Avakian respectively and their staff, especially Claire L. Paulding. Kathryn A. Willmore, Vice President and Secretary of the Corporation, and Ann J. Wolpert, Director of Libraries, are acknowledged for their valuable assistance. My appreciation goes to the MIT Office of the Academic Services and Registrar for the diligent cooperation and information that they provided, especially Mary R. Callahan, Constance C. Scribner, and Iria J. Romano. The Association of Alumni and Alumnae, particularly Christine Tempesta, joins this group of supporters. I am appreciative of the essential work by the MIT News Office, especially Kenneth D. Campbell, Mary Anne Hansen, and Alice C. Waugh. Tremendous appreciation goes to our MIT photographers, Donna Coveney and Edward McCluney, for their great precision and positive results.

The MIT Press under the leadership of Frank Urbanowski has been especially skillful and professional in taking the manuscript and turning it into a publishable document. I am particularly indebted to Michael Sims, Managing Editor, who has used his ingenious talent to make several vital suggestions that were incorporated into the book. Among the many others at the Press who contributed to the production were Yasuyo Iguchi, Terry Lamoureux, Erica Schultz, Gita Manaktala, Kerry Murphy, Jud Wolfskill, and Mare Freed. Additional editorial work was done by Karyn Lu, Bruce McCuen, and Fran Pulver.

Lois Malone, who edited the manuscript, used her extraordinary editing skills to clarify the tran-

scripts without altering their tone. I am truly grateful for her efforts to make certain that the transcripts say exactly what the interviews intended.

My thanks go also to the numerous people who assisted me in my explorations to gather materials for the book in many locations of this country, such as taxicab owner Donald Harrington, who drove me to many homes and offices of interviewees in Washington, D.C., Maryland, and Virginia; Dr. Reginald Parker, an alumnus, who set up interviews for me in Atlanta, Ga. and Tuskegee, Ala. with other MIT graduates; Professor Samuel Myers, an MIT Ph.D. economist, who sponsored and coordinated my interview visit to the Minneapolis/St. Paul, Minn. area including a luxurious luncheon session with about 20 alumni/ae where several of them met for the first time; and locally Johnny, my barber, and Drs. Ronald Weston and Robin Cox, my dentists, who gave me timely assistance and encouragement to complete this work. These individuals are examples of very special people from various walks of life who have been helpful to me during this undertaking. My brother Ralph Williams and his daughter Bernadine were most helpful by reading and giving their thoughts about what they heard the student interviewees as a group expressing in their transcripts. Their efforts are greatly appreciated. In this light, Professor William F. Pounds (a former dean of the MIT Sloan School of Management) took the time to read the manuscript and made extremely helpful suggestions. I truly thank him.

One of the most important acknowledgments goes to Professor Kenneth R. Manning, who not only reviewed the manuscript and gave invaluable guidance, but advised me on every important phase, including essential planning and identifying key personnel to work with me. I will forever be grateful for his exceptional counsel. In that light, I wish to also thank Professor James H. Williams, also an alumnus, for his advice and dependable support. My past and present mentors and friends—Helen G. Edmonds, Jerome H. Holland, Floyd L. Bass, Paul E. Gray, Jerome B. Wiesner, Howard W. Johnson, Julius L. Chambers, Constantine B. Simonides, and Charles M. Vest—must be mentioned here because their lessons and support have given me the determination to complete this document.

My staff has been loyal and faithful throughout this process. I have been more than ably assisted by Stephen R. Charles, who has coordinated the contacts with interviewees, recruited and scheduled oral history transcribers, provided computer expertise, and in general supervised the office activities. Philip N. Alexander's contribution to the completion of this work has been of the highest order relative to conceptual creativity and technical expertise. His expertise in research, historiography, writing, editing, transcription and transcription oversight, training of transcribers has

been extraordinary. His advice and thoroughness in carrying out numerous intricate assignments have been essential.

Finally, to my wife Mildred, I owe gratitude and tremendous appreciation for her understanding, patience, tolerance, sacrifice of time, and work on this project. My sons, Clarence, Jr., and Alton Leroy and their wives, Joanne and Bryan have all been pillars of strength and encouragement when needed throughout this process. I have been truly blessed to have such an extraordinary family.

Adam C. Wilson, Nancie M. Barber, Clarence G. Williams, Stephen R. Charles, Philip N. Alexander (left to right).

INTRODUCTION

ALMOST THREE DECADES AT MIT: A PERSONAL PERSPECTIVE

One day in the spring of 1972, while working on my doctorate at the University of Connecticut-Storrs and weighing future career plans, I came across an interesting ad in *The Chronicle of Higher Education* seeking applications for the post of assistant dean of the MIT Graduate School, with special responsibility for increasing the number of minority graduate students. I was excited by the possibilities, coming as I did from a background in administration at Hampton Institute (now Hampton University), one of the nation's top historically black colleges. If I went to MIT, I could continue to pursue my interest in the education of minority youth. Coincidentally, my key mentor—Jerome Holland, then serving as U.S. ambassador to Sweden after a term as president of Hampton—happened to be a member of MIT's governing body, the Corporation, the first black so appointed. He encouraged me to apply for the job.

MIT screened more than a hundred candidates, but by the summer I was on a short list of about six. I came for the interview and found, to my surprise, that competing candidates came on the same day, met each other over lunch, and went in and out of their interviews with a selection committee made up not only of faculty and administrators but students as well, including black graduate students. Among those students were Shirley Jackson ('68), now president of Rensselaer Polytechnic Institute and a life member of the MIT Corporation since 1992, and Linda Sharpe ('69), now a manager with a private company doing contract work for the Federal Department of Transportation, and a term member of the MIT

Corporation beginning in 2000. It was clear to me that the students were major actors here, if not in charge, and that it was they who had persuaded the administration to create this post and who would be a decisive voice in selecting a candidate. I learned that they had already worked hard with the administration, through MIT's Task Force on Educational Opportunity and other forums, to increase the number of minority graduate students from 16 in 1968 to 112 in the forthcoming academic year, 1972–73, and that the position for which I was applying had been created to ensure that this momentum would be sustained and, if possible, increased. The whole process seemed like a grass-roots initiative, an exercise in true democracy—something I would not have expected to find at an institution like MIT. I had never experienced anything like it.

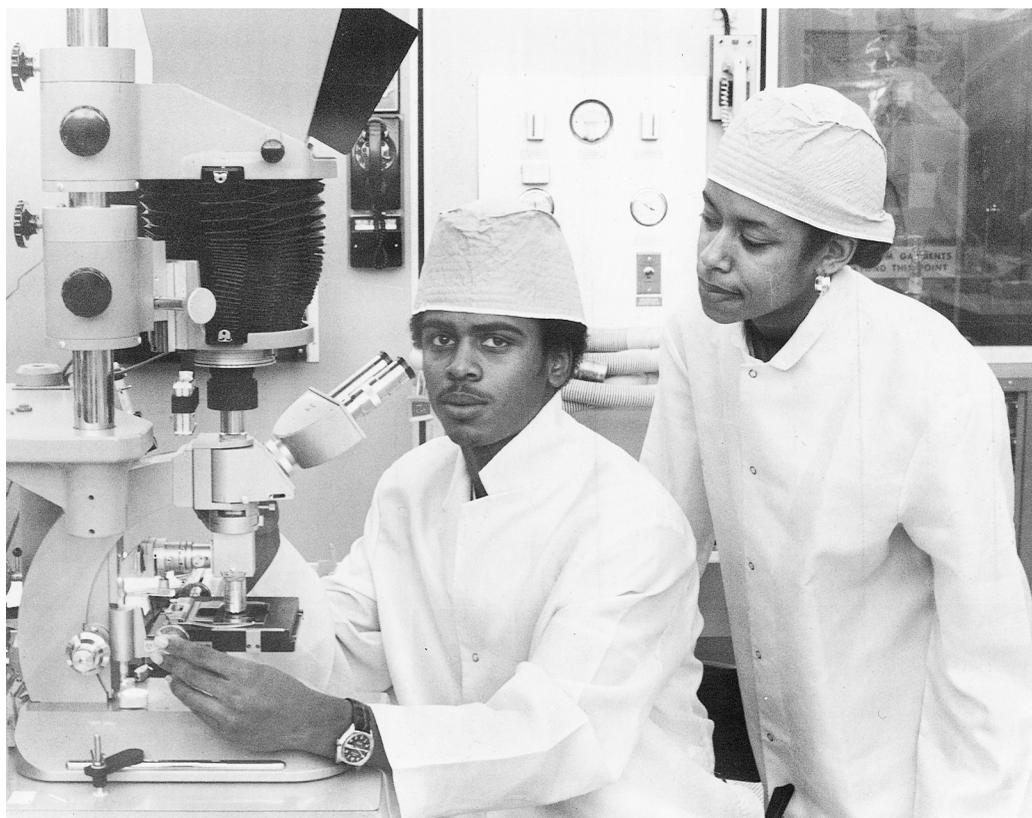

As it turned out, I was the candidate selected. My appointment was effective September 1, 1972, as an assistant dean of the Graduate School under Dean Irwin Sizer. When I arrived, my charge was to increase the number of minority students in the graduate programs and to develop a retention program to ensure that, once here, these students did not fall through the cracks.

I got to work on both tasks right away. I developed a strategy to identify and recruit outstanding black and other minority students who could benefit from the rigors of an MIT education. In the summer of 1973, I coordinated a meeting of educators from predominantly black colleges in the South—members of the Thirteen College Curriculum Program (TCCP)—to explore ways in which MIT could attract more graduate students from Southern minority schools. The Graduate School hosted this meeting.

Frederick Humphries, who went on to serve as president of Tennessee State University and who is now president of Florida A&M University, was the director of TCCP and vice president of its parent organization, the Institute for Services to Education. Also in the group were Elias Blake, then president of Clark College (now Clark Atlanta University) and head of the Institute for Services to Education, and a number of senior administrators from other historically black colleges and universities (HBCUs). Each summer they had met at Pine Manor College in Chestnut Hill, Massachusetts, to share ideas and strategize. At the MIT meeting, when the first moonwalk was a recent memory, one of the college presidents wondered why, if we could put men on the moon, we could not get MIT to do something relatively simple like admitting black graduate students in

greater numbers. Among the results that emerged was the Lincoln Laboratory Summer Minority Internship Program, bringing students in electrical engineering and physics to MIT's Lincoln Laboratory for ten weeks to introduce them to hands-on work and to MIT graduate programs in their respective fields.

In the fall of 1973, a year after my arrival, 60 new minority graduate students registered in various programs, bringing the total number at MIT to an all-time high of 136. I worked as assistant dean until January 1994, when I became "special assistant to the president and the chancellor for minority affairs." John Turner then came as assistant dean (later promoted to associate dean) and advanced the minority graduate program in a number of ways. He was instrumental, for example, in founding the Black Graduate Students

Lincoln Laboratory Summer Minority Internship Program, 1976. Photo: Calvin Campbell

Association (BGSA), a group that encouraged minority entrants and helped shape a community of black graduate students at MIT.

My new duties as special assistant covered not just minority graduate students but all matters relating to minorities at MIT, including advising senior officers on recruitment and retention of minority faculty, students, and staff; advocacy of the interests of minority members of the community; and addressing formal and informal complaints or concerns relating to treatment of minorities at the Institute. I was also the MIT representative on minority issues to the outside community. This included participation in urban affairs and affirmative action/equal opportunity conferences, boards, and other activities on the local and national levels. I also became an ex-officio member of the Institute's Personnel Policy and Equal

Opportunity Committees and of the Faculty and Administrative Councils; I believe I was the first black to sit on the latter two. The Faculty Council consists of all academic department heads and directors of research departments and centers, while the Administrative Council is composed of senior officers and middle managers.

Paul Gray ('54), MIT chancellor at the time, stated in announcing my appointment that the Institute was "very fortunate to have Dr. Williams in this critical position, the purpose of which is to provide creative leadership and staff support for all minority matters and concerns at MIT." An analogous position dealing with women's interests had been in place for about a year ("special assistant for women and work," a position filled by Mary Rowe), and this new position advocating the interests of minorities had come about as a result

John Turner, assistant dean of the Graduate School, with a graduate student, mid-1970s. Photo: Calvin Campbell

of pressure from the black community at MIT. If there was to be an administrative position of such stature and prominence for women, they reasoned, there should be one for minorities too.

Paul, representing the administration, asked me to accept the position, and he and I then began working closely together. Jerome Wiesner, the president at the time, was spending more time away from the Institute fundraising, and as chancellor Paul was responsible for the day-to-day operations of the Institute.

There were two areas, as I understood the job, that I would focus on: I would advise the president and other senior officers about minority issues and make suggestions about how to enhance programs relating to minorities; and I would develop new programs for minorities on campus. I served as the administration's eyes and ears, as I saw it, on issues relating to minorities, with a broad mandate to develop ideas, strategies, and programs. While I couldn't always be certain that these proposals would be acted on favorably, I felt that Paul and Jerry would most likely support at least modifications of my ideas. I dealt with Paul more than Jerry, but I did talk to Jerry periodically and found him to be sensitive and supportive on nearly all my concerns regarding race and race relations.

Early on, I would meet with Paul about once a month, but I had access to him more often if necessary. We didn't meet too often because I wanted the flexibility to generate ideas on my own and with others, and also to be considered someone with a level of independence. Paul and Jerry were comfortable with this; it helped inspire confidence that I was doing what I could possibly do to meet the needs of minorities. I did not want to be thought of as a mere attachment to the office of the president and chancellor, yet at the same time I needed to preserve access routes to Paul and Jerry. Achieving that balance wasn't always easy, but it helped that Paul and Jerry agreed with my approach and were supportive.

During that first decade or so, 1974 into the mid-1980s, I think I did a reasonable job of improving communication between blacks on campus. As the faculty goes, so goes the institution; so if anything was to be achieved for minorities at MIT, senior faculty would have to become involved, flex their muscles, exercise their influence. With this in mind, I brought together black faculty and senior black administrators with the

hope of creating a consensus on critical issues and, if possible, coming up with strategies for action. A group of us would meet to brainstorm, and we sometimes invited Paul to dinner to share our thoughts.

In October 1975, I organized a day-long retreat for black faculty and administrators at the Endicott House, MIT's conference facility in Dedham, Massachusetts. We discussed issues, carved out strategies, explored ways to establish closer ties among the various segments of the black community at MIT, and developed specific objectives for follow-up. One faculty member wondered, half jokingly, whether the Endicott House—"white man's territory"—was an appropriate venue for such a retreat, but we made good progress in our discussions nonetheless. Thirty-five faculty members and administrators were present. The group felt that priority should be given to consciousness-raising about racial bias at MIT, recruitment of black faculty, inclusion of blacks in decision-making at the highest level of the administration, and affirmative action efforts across all categories of personnel. Exactly how we would go about this ambitious program remained undecided, but suggestions included further meetings, liaison with the president, chancellor, and other officials, and a more proactive campaign on the part of black faculty and administrators.

By 1978, a core group of us—Wesley Harris, Willard Johnson, John Turner, Wade Kornegay, James Young, and myself—had come together semi-officially as "the Group of Six." At a meeting in Washington, DC in the spring of 1978, we tried to further define our goals. We decided to step up efforts to place blacks on key MIT policy committees, and to prepare position papers on issues such as recruitment, academic performance, and financial aid. We then held a round of meetings with top-level administrators and, in September 1978, submitted a paper—"Blacks at MIT: The Challenge for Full Participation in the 1980s"—to the administration assessing the quality of academic life for black undergraduates, the status of graduate education for blacks, and the prospects for black faculty, administrators, and research staff. This effort was made to encourage the Institute to consider these concerns as it prepared to select its next president—who became Paul Gray in 1980.

In August 1981 a slightly expanded group—now including Frank Jones, Shirley McBay, Phyllis

Wallace, and James Williams, in addition to the original members of “the Group of Six”—met at a retreat organized by John Turner and myself at the request of the group, to discuss the objectives outlined in the 1978 position paper and to review progress on our recommendations. We spent a weekend in intense discussions on Shelter Island, off the east end of Long Island. Our sense of urgency was increased because of Institute-wide budget deficits that threatened not just our prospects for progress, but also existing programs and personnel; we feared that retrenchment might diminish the Institute’s commitment to minority issues.

Such occasional retreats created, I believe, a framework to mobilize the senior black faculty and administrators. However, while we opened up avenues of discussion, we were unable to sustain our momentum over the years or to come up with a consensus. The dynamic did not work out as well as I had hoped, but it did have an impact on the administration.

One difficult situation arose when Paul Gray took over the presidency from Jerry Wiesner in 1980. He met with senior black faculty members in an effort to persuade one of them to assume the directorship of the Office of Minority Education (OME). A replacement was needed for Wesley Harris, a black tenured associate professor of aeronautics and astronautics, who had served as the first OME director beginning in 1975 until he went on leave in 1979 as a program manager at NASA headquarters. Paul and the black faculty unanimously agreed that, in order for OME to sustain its credibility, the directorship ought to continue to be held by someone not only with academic stature, but with affiliations in a quantitative field central to MIT’s primary educational and research mission. Paul was deeply disappointed when black faculty ideally suited to the job would not accept it, because of the toll they thought it would take on their primary professional and scholarly pursuits. Meanwhile, in order to keep the office going, a supportive senior white faculty member, Arthur Smith, a professor in the Department of Electrical Engineering, served as acting director (1979–1980), and I succeeded him, also as acting director, in 1980. I served until 1982, and all my successors were black administrators without faculty status.

Also in 1980, Mary Rowe and I became “special assistants to the president,” that is, without the title qualifiers “for women and work” and “for

minority affairs.” While both Mary and I retained our special functions—she in the area of women, I in the area of minorities—the idea was to broaden our reach. We were to be accessible as “shuttle diplomats” or mediators for all faculty and staff, facilitating communication between conflicting parties, complaint and grievance resolution, the flow of essential information to department heads and supervisors (a kind of “early warning system” in problem areas), and response to informal concerns, inquiries, suggestions, and problems. In short, Mary and I maintained an ombuds-person’s role.

In those early days, I was excited about the number of outstanding colleges and universities in the area and about the opportunity to develop relationships among black administrators and faculty outside MIT. In the early 1980s, I worked with a group of local black college administrators to organize the Greater Boston Inter-University Council (GBIUC), bringing together personnel from local colleges and universities to develop retention strategies for students of color. Among the original group were Ken Haskins, then co-director of the Principal Center, Harvard School of Education; James Cash, a professor at the Harvard Business School; Dexter Eure, then director of community relations at the *Boston Globe*; Kenneth Guscott, a prominent businessman; Bernard Fulp, then senior vice president of Bank of New England; and myself.

Our discussions began informally over breakfast once a month. We talked, for example, about the high dropout rate of black students at local colleges and universities—especially Northeastern University, which had a dropout rate of about sixty percent at the time. The group asked me to come up with a program to address such issues in practical ways, and that is how the GBIUC concept got under way. I was selected as the first president, and the organization continues to carry on the work begun fifteen years ago. At the inaugural GBIUC forum sponsored by the *Boston Globe* in June 1984, I delivered a position paper—“Retention of Black College Students: Where Should We Go During the 1980s?”—which provided a basis for GBIUC’s future activities, including networking, professional development workshops, region-wide alliances, and efforts to evaluate institutional commitment in addition to strategies for student recruitment and retention.

During this period, the early to mid-1980s, I also became involved in one of the most satisfying and successful activities of my career—shaping the Association of Black Administrators at MIT and organizing two national conferences for which I was co-coordinator (the other co-coordinator was John Turner, associate dean of the Graduate School). While efforts to organize the black faculty never totally materialized, efforts to bring the black administrators together resulted in a supportive and successful group that met regularly to share information, ideas, and perspectives. I served as convener of this group. However, in the mid-1990s this group gradually diminished, in my view due to the lack of leadership.

The two national conferences—the First and Second National Conferences on Issues Facing Black Administrators at Predominantly White Colleges and Universities, held in 1982 and 1984 respectively—were an outgrowth of our informal meetings and discussions in which John and I served as group leaders. The conferences attracted not only black administrators but also major black

figures (a few key white ones as well) in public life—judges, elected officials, media personalities, national leaders in the struggle against racial discrimination—to explore the anxieties, stresses, and aspirations of black administrators within often hostile academic environments. Much was learned in those two conferences, and the published proceedings—*Proceedings: First National Conference on Issues Facing Black Administrators at Predominantly White Colleges and Universities* (Cambridge, Mass.: Association of Black Administrators, MIT, 1982) and *Proceedings: Second National Conference on Issues Facing Black Administrators at Predominantly White Colleges and Universities* (Cambridge, Mass.: Association of Black Administrators, MIT, 1984)—are an enduring source of insight. Unfortunately, the energy to continue our discussions and to organize further conferences did not last, even though many of the issues that we explored exist today, real and unresolved.

I am also proud of my role in the annual Martin Luther King, Jr. celebration at MIT. This began in 1975, seven years after Dr. King's assassi-

nation, when I was asked by Jerry Wiesner and Paul Gray to plan an event to commemorate Dr. King's life and work. The following year, the Institute was well ahead of most institutions and all governments in designating an annual holiday in honor of Dr. King. In my role as special assistant to the president and chancellor, I was responsible for planning and coordinating the annual celebration. It revolved around a breakfast or dinner meeting and a public address by an invited speaker, selected for his or her insight in the area of civil rights, race relations, and other issues dear to Dr. King's heart. I always thought it was important to emphasize local community leaders, following Dr. King's own preference for "grass-roots" activists as well as figures of national renown, although our program at MIT has since moved away from that philosophy in search of high-profile speakers. The text of addresses delivered during the first twenty years of the celebration appears in a book that I edited—*Reflections of the Dream, 1975-1994: Twenty Years Celebrating the Life of Dr. Martin Luther King, Jr. at the Massachusetts Institute of Technology* (Cambridge, MA: MIT Press, 1996).

In recent years, planning for the celebration has been the responsibility of the Martin Luther

King, Jr. Celebration Committee, of which I have remained a member. Related developments include the Martin Luther King, Jr. Youth Conferences, first convened in 1990; the MLK Visiting Scholars program to recognize and host minority scholars on campus (the first MLK Scholar, Henry McBay, was appointed in 1991); and the MLK Visiting Professors program, established in 1995 as an expansion of the Visiting Scholars program, bringing several visiting professors to campus each academic year (the four inaugural MLK visiting professors, appointed in 1995, were Wesley Harris, Richard Joseph, Steven Lee, and Oliver McGee). Both of these programs have contributed considerable vitality and substance to the MLK activities.

I have found the most joy, I think, in teaching a course—"Bridging Cultural and Racial Differences"—offered in the Department of Urban Studies and Planning, where I am an adjunct professor. We explore a range of cultural and racial issues in contemporary America, trying to understand the origins of racism and developing strategies and techniques for conflict resolution. I have worked with some outstanding young future leaders in this course, minority and non-minority

The first Martin Luther King, Jr. observance at MIT, January 1975. Photo: Calvin Campbell

alike, and we have learned a lot from each other. I started teaching it in the early 1990s, and my only regret at the end of each semester—when I recognize the levels of racial and cultural understanding achieved—is that I did not start long before. As part of our formal curriculum, such courses can do much to break down the fear, intolerance, and hatred that are still too prevalent in our society.

I would single out one area—monitoring and promoting equal opportunity—as the most frustrating in my nearly three decades at MIT. In my view, the problem is partly structural, partly indifference or hostility on the part of non-black faculty, and partly insufficient pressure from the minority community on the leadership at the departmental and central administrative levels. For much of my career here, the late Constantine Simonides ('57), vice president in the Office of the President, served as equal employment officer, assisted by a succession of assistant equal employment officers, all black, who basically ran the operation and reported to Constantine. He or she did all the procedural work, monitoring faculty and staff search processes as well as education, recruitment, and advising the chair of the Equal Opportunity Committee; responding to inquiries and reviews by the U.S. Department of Labor and the Office of Federal Contract Compliance Programs (OFCCP); investigating issues relating to employment discrimination; gathering data from the various schools and departments reflecting the Institute's progress (or lack thereof) with affirmative action; and compiling a detailed report of how many people had been hired, how many were minorities, how many were women, and so forth. As vice president and equal employment officer, Constantine would then present the report to the Academic Council—the Institute's central decision-making body, made up of all senior officers—and make policy decisions with others such as Jerry and Paul, whose reliance on Constantine in this and other matters was enormous. This affirmative action report required by the OFCCP is used both inside and outside MIT to make public the Institute's efforts in affirmative action.

Following Patricia Garrison, Isaac Colbert, and Patricia Bell-Scott, I took over the job of assistant equal employment officer in 1984. Although the job did not require it, I prepared an internal report at the end of my first year identifying some

key areas where I thought we had made progress and others where I thought progress could be improved. Faculty recruitment efforts had not measured up to expectations (for example, Professors Sylvester James Gates and James Hubbard had left after being denied tenure), the proportion of minority graduate students had declined since 1974, the OFCCP had observed deficiencies that were later corrected, and a number of minority employees had complained about unfair treatment and poor work environments, with possibly racial overtones. I suggested measures for improvement, including seminars, social events, and visiting minority faculty who would provide a black presence until the number of minorities on the regular faculty increased.

The duties of the job were a good fit with my other responsibilities as special assistant to the president—racial discrimination, for example, arose frequently in the course of my work as ombudsperson. Yet the structure of the operation never seemed right to me, this idea of an “assistant” who happened to be black, with little if any authority, and reporting to the vice president in the President's Office. In my view, it was (and still is) a mistake not to have a black or other minority in a position to be heard directly at the highest level of the administration. A minority in charge, I believe, would have added legitimacy to the process. It was also clear from my contact with similar offices at other institutions in the area, especially the Ivy League colleges and universities, that we were understaffed relative to the complexity of our mission and to the demands placed on us to gather and review data, monitor compliance, and report to the regulatory bodies both within and outside MIT.

In May 1975, a little over a year after being appointed special assistant to the president and the chancellor, I wrote a memo to Jerry and Paul pointing out differences between the rhetoric of affirmative action and the results as illustrated by the number of blacks in certain categories at MIT (1.6% faculty, 1.4% sponsored research staff, 2.0% academic staff, and 4.5% administrative staff). I also suggested that the problem stemmed from “subtle attitudinal patterns of non-blacks who have been unable to accept full partnerships between blacks and non-blacks” at MIT, and that there would never be much improvement unless the administration brought pressure to bear on the faculty.

There was a note of frustration in Jerry's and Paul's response to that memo, the reasons for which I did not fully understand at the time but which I later came to appreciate. After learning more about the ways of the Institute, it became clear to me that a president or chancellor has limited influence with tenured faculty and the directions taken by individual departments. Tactics of persuasion must be carefully thought through, and even then there are no guarantees of success or even progress. Indeed, the proportion of black faculty now (2.5%), while better than in 1975 (1.6%), is still far too small—no pain, no gain.

Jerry and Paul did try some things, such as financial incentives—fully funded positions along with extra cash—to encourage departments to hire minorities. But that made little difference. Few departments acted on the offer. The argument about the lack of minorities “in the pipeline” often became a convenient way for departments to sidestep racial attitudes or indifference within their own ranks. Other strategies could have been tried by the central administration, but weren't—holding department heads accountable for results, for example, or publicly recognizing achievement in those rare instances where minorities were hired. But there were no assurances that these would have worked, either. The Institute culture is such that there is only so much the administration can do to exercise influence with a tenured, senior faculty that is brilliant, independent, and not always open to change or new perspectives on issues such as race. One had to just accept that and move on—never forgetting, of course, how things could or should be in a better world.

So the assistant equal opportunity officer was structured out of the process, for all intents and purposes, at least as far as faculty recruitment was concerned. We would have talks with department heads, but talking was all that happened; when we went away, the status quo remained intact. We had better success on the staff level, but at the faculty level—at the core of the teaching and research mission—we have still been unable to make much headway.

When obstacles were placed in the way of two of our most promising black junior faculty members, Jim Gates and Jim Hubbard, I became convinced that no serious change was likely to happen. Gates was rebuffed by his department (mathematics) and went on to accept a tenured

appointment at the University of Maryland, where he has excelled as a scholar and educator, acquired an international reputation, and been appointed to the coveted John S. Toll professorship in recognition of his distinguished achievements. Hubbard, who was almost legendary among MIT students for his teaching and research skills, was also denied tenure. He went on to become one of the nation's leaders in technology, heading a section at MIT's Draper Laboratory and then serving as a senior systems engineer at Boston University's Center for Photonics Research and as a valued advisor to major government science agencies and to organizations such as the National Research Council, the operating arm of the National Academies of Science and Engineering. In both these cases, dating from the early to mid-1980s, the Institute turned away two of its most talented black scholars and teachers of science and engineering. They were “home grown,” in every sense of the term; both had shone as undergraduate and graduate students at MIT before being appointed to the faculty.

When Professors Gates and Hubbard were turned away, I realized that those of us whose mission was to increase diversity among the faculty were fighting a battle that wasn't just uphill, it was up a mountain. I find unconvincing the argument by many senior white faculty members that such cases have nothing to do with race and that two out of ten faculty members overall fail to proceed all the way through the system to the award of tenure. The fact that Professors Gates and Hubbard were widely recognized as exceptional, talented scholars and educators, as candidates for at least the top fifth in any pool of faculty at MIT or elsewhere, raises questions about what else may have been at work in their rejection. While we at MIT may pride ourselves on the use of objective criteria in all our functions and activities—we are, after all, a premiere scientific and engineering institution—we are not always free of the conscious and unconscious prejudices common in our society at large.

My role in equal opportunity led me to a deeper understanding of how limited that process is—not just here at MIT, but at institutions nationwide. Essentially, the process allows institutions either to do very little or to obey only the letter of the law. The U.S. Department of Labor bureaucracy is cumbersome and ill-equipped to monitor

progress in affirmative action; its compliance staff tends to be unfamiliar with the way a university operates, and therefore makes unfounded judgments. Meanwhile, the mood of the country has been swinging slowly but steadily toward the notion that “affirmative action” is unfair and an example of government waste, or a low priority at best, and there are complaints—even from some supporters—about how clumsy and impractical it has become. There is some truth to the observation that affirmative action compliance, both here and elsewhere, has generated mounds of paperwork to little or no effect, considering the original objective.

I remained in the position of assistant equal opportunity officer until 1994, in addition to my other duties as ombudsperson, adjunct professor of urban studies and planning, and special assistant to the president. I then started to direct my energies more toward reaching the minority community here directly, shifting away from trying to persuade whites to “help” blacks and other underrepresented minorities, and toward generating dialogue and relationships between minority students, staff, and faculty. Only through a cohesive, bonding community, I felt, would we have a chance to achieve the place we deserve here, to contribute to the fullest extent of our abilities, and to be recognized for those contributions. We cannot rely on the good will of others to accomplish this for us. This is a pragmatic approach in an environment where blacks and other minorities do not share much in the balance of leadership, even where sharing would be not only appropriate but right, and where concepts like “diversity,” “recruitment,” and “inclusion” are often expressed but not always or consistently acted on.

THE BLACKS AT MIT HISTORY PROJECT: BIRTH, GROWTH, AND EVOLUTION

In the spring of 1995, MIT offered an early retirement package to employees who met certain requirements as to age and length of service. Since I had been here for twenty-five years, and was past the minimum age requirement, I could have accepted the offer. But I wanted to stay, for at least two reasons.

First, MIT has been my home away from home—North Carolina—for a quarter of a century. During that time, I have seen a number of

positive changes, especially in the increasing diversity of the undergraduate student body. But I do not believe that the Institute has made as much progress as it could in minority recruitment within the faculty ranks, in promoting multiracial leadership, and in encouraging members of the MIT community—particularly students—to learn from each other’s differences. In these areas, much remains to be done.

I also wanted to stay at MIT to write about the experiences and contributions of blacks here. When I arrived in 1972 as a young man, the first person in the newly created post of Assistant Dean of the Graduate School for Minority Students, I came with the impression that I was the first black to work on efforts to recruit minority graduate students. But soon afterward I began to hear that there had been a black woman—Dorothy Owusu, the daughter of community activist Ruth Batson—doing the same thing before me, although with minimal support, as an administrative assistant in the Graduate School office. She had paved the way for me. I would not have known about her but for a chance conversation.

I then began to ask around the Institute about other blacks who had been here, but no one knew much. As I looked around me that first year, 1972–1973, one of the things that struck me was that there was not a single picture of a black person on the walls. I became committed to putting together some record of the contributions of black folks here, a legacy for the community at large and for the young men and women of all colors who one day might decide to come here to work or study.

In the ensuing twenty-plus years, I saw a number of positive things go on, both at MIT and outside, with respect to addressing issues affecting minorities in higher education. Still, always at the back of my mind was this idea that little was known about the history of the black experience at MIT. So when 1995 came, in certain respects a good time for me to leave the Institute, I had this personal dilemma: Would it be right to go without leaving behind some record of the black experience here? Also, I was disappointed in a number of my white colleagues with whom I had spent a lot of time discussing and developing strategies and policies for affirmative action. As a result, I felt it was imperative that I document issues related to race in MIT’s history.

One morning in the spring of 1995, I went to see Paul Gray, the former MIT president who was then serving as chairman of the MIT Corporation, and with whom I had worked closely starting in 1974, in my post as special assistant to the president and the chancellor. I fumbled for words to discuss early retirement with him—"retirement," of course, only in the sense of leaving MIT, since there was no question in my mind that I would pursue other professional opportunities elsewhere if I did leave. The decision, he said, would have to be mine and mine alone. But he raised a key question—"Is there anything, Clarence, that you think you would like to do that you have not had a chance to do here?" I told him I wanted to do a history of blacks at MIT. He asked me to put together a budget, and promised to come up with financial support. And he came through on that promise.

That is how the project got started, with the support and interest not only of Paul Gray, but also of current MIT president Charles Vest. I had the ambitious but (in retrospect) foolish notion that I could complete the task in two years, while carrying out my other responsibilities as ombudsman and teaching in the Department of Urban Studies and Planning. I was in for a surprise. The project turned out to be far more complex and time-consuming than I ever imagined.

A number of people have asked, "Why are you pursuing this project?" I tell them that after gathering a considerable amount of research materials, I have become even more convinced that now—as we enter the new millennium—is a good time to step back and reflect on the role and experience of blacks at MIT, and on what we have learned in the quarter-century or so since the establishment of affirmative action policies and systematic minority recruitment efforts here. I believe that we at MIT are a reflection of the best in educational and community standards; therefore how we address these matters provides an example for other institutions in shaping their own relationship with blacks and other minorities.

I began The Blacks at MIT History Project in the fall of 1995, and thought of it as a way to record the black presence at MIT. I also intended to recognize a certain group of non-black individuals who have been active in the effort to correct policies of racial exclusion (or at least non-inclusion) and to foster racial harmony, tolerance, and

diversity at MIT. In effect, it is about exploring the black experience, assessing our role, and leaving a legacy so that future generations may relate to our hopes and disappointments here, to our struggles and achievements. Historically, it has always been individuals like these who helped bring about change.

Several studies on blacks and racial issues have been undertaken at MIT during the last two or more decades. A number of policy papers have examined the academic performance of black students, beginning in the early 1970s, when the Institute sharply increased the enrollment of undergraduate black students. Kenneth Schoman (SM '70) conducted studies in the early 1970s, at the request of Paul Gray and in consultation with administrators such as John Mims, William Hecht ('69), and James Bishop (Ph.D. '69). In 1972, for example, Schoman presented a report—"Academic Performance and Admissions Indices of Black Students at the Massachusetts Institute of Technology"—analyzing the academic performance of 157 blacks who had entered as freshmen in 1969, 1970, and 1971. This was an expansion of a confidential memorandum—"Predicting the Performance of Black Freshmen ('73)"—prepared for the Task Force on Educational Opportunity in December 1970.

Other studies and reports followed. The Analytical Studies and Planning Group, led by Constantine Simonides and staffed by David Wiley (former registrar) and Kathryn Lombardi (now Kathryn Willmore, vice president and secretary of the Corporation), conducted a survey of alumni in the mid-1970s, including a subset of recent black alumni. In 1985–1986, John Wilson (currently assistant provost for outreach and director of foundation relations and school development services) served as an associate with the Analytical Studies and Planning Group, conducting a survey of black alumni and co-authoring, with David Wiley, a report on black students who attended MIT from 1969 to 1985. Around the same time, Shirley McBay, former dean for student affairs and the first black to sit on MIT's Academic Council, spearheaded a study of the racial environment at MIT, published as *The Racial Climate on the MIT Campus: A Report of the Minority Student Issues Group* (Cambridge, Mass.: MIT, 1986). By demonstrating the need to raise awareness and to improve campus race relations, this report received national

attention. Paul Gray, MIT president at the time, was interviewed about the study on national television. Other reports issued by the Minority Student Issues Group (MSIG) included *The Recruitment and Retention of Minority Students at MIT* (Cambridge, Mass.: MSIG, 1989).

These are just a few examples. In addition, students and others have undertaken related projects from time to time. In 1972, Lawrence Dean (who had entered with the class of 1973) made a start at compiling a historical roster of black MIT students. A year later Cleve Killingsworth ('74) carried out an Undergraduate Research Opportunities Program (UROP) project under Floyd Barbour, a black assistant professor in the humanities, "to obtain information about former black students at M.I.T." A preliminary directory—*M.I.T. Black Alumni*—was published by the Placement Office in 1973, with assistance from Mary Hope, former assistant dean of student affairs. In 1976, John Turner and I recruited Kimberly-Ann Francis ('78) to compile a historical list of black students from the registrar's records and other sources. With the cooperation of the MIT Museum there were a few exhibits on blacks at MIT during "black history week" in the mid-1970s. Dianna Abney ('83) wrote her undergraduate thesis on blacks at MIT—"Notes on Researching Blacks at MIT Prior to the Class of 1930." Most recently, Darian Hendricks ('89) and the Black Alumni of MIT (BAMIT), after years of reflection on the history and experience of blacks at MIT, have initiated the Robert R. Taylor Network, an interactive multimedia archive for young blacks wishing to explore the contributions of scientists, engineers, and inventors of African descent. All these studies, writings, and projects have been extremely helpful in my own efforts to compile materials on the history of blacks at MIT.

The wider literature on blacks in higher education explores issues such as desegregation, counseling and adjustment, cultural barriers, environmental factors, struggle and protest, student performance, and affirmative action. The methodologies are often statistical, using data from case studies and surveys to make impact and trend assessments. A recent example is the impressive study by William Bowen and Derek Bok, *The Shape of the River: Long-Term Consequences of Considering Race in College and University Admissions* (Princeton, NJ: Princeton University Press, 1998), which used data on over eighty thousand students

from twenty-eight colleges and universities. The issues of "diversity" and "affirmative action" have also provided a focus for leading university administrators, as illustrated, for example, in recent annual reports by the current presidents of MIT and Harvard (Charles Vest and Neil Rudenstine, respectively). The literature also includes examples of conference proceedings on problems relating to race in higher education, informational material on minority intervention programs, institutional affirmative action plans, and data compilations by the federal government. Few studies focusing on the black experience at a particular institution, however, have as yet appeared. One is *Blacks at Harvard: A Documentary History of African-American Experience at Harvard and Radcliffe*, edited by Werner Sollors, Caldwell Titcomb, and Thomas Underwood (New York University Press, 1993), a compilation of historically significant documents relating to the black experience at Harvard.

My own work is a departure from these examples, in that it looks at the role that personalities of African descent have played in the development of an eminent, predominantly white institution of higher learning whose mission relates primarily to science and technology. It is different, too, because it views the history of the institution primarily through the eyes of blacks, and through the eyes of a smaller number of non-blacks reflecting on racial issues. While it uses many of the traditional methods employed by others, as outlined above, it attempts to build a perspective based on the testimony and unique experiences of blacks whose lives have touched—and been touched by—this institution. I hope this effort will provide the incentive for others to explore the role, contribution, and experience of blacks at other institutions and throughout society.

A FEW MILESTONES

An overview of key milestones in MIT's history—particularly those most relevant to the role and experience of blacks at the Institute—is in order here so that the reader may have a context for the oral history transcripts which make up the main body of this book. MIT's history, I believe, reveals the evolution of social and racial perspectives in an institution of higher learning over a period of nearly a century and a half. The overview pre-

sented here serves as a basis for a fuller development of this theme in a projected second book, tentatively entitled *Search for Identity: A History of the Black Experience at MIT, 1865–2000*.

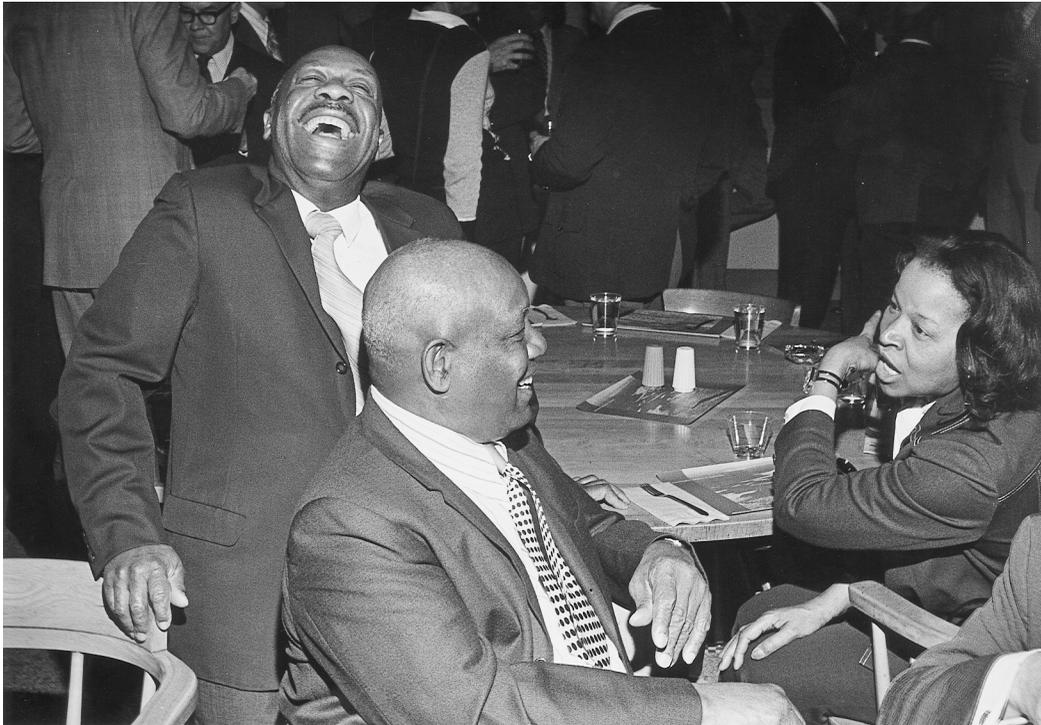

The history of the role and experience of blacks at MIT falls roughly into four periods:

- from the late nineteenth century to 1920;
- from 1921 to 1954;
- from 1955 to 1968;
- from 1969 to the present.

The first period, from the late nineteenth century to about 1920, was a time when few blacks were part of the MIT community, and most of them held service positions. There were no black faculty and just a handful of black students. The earliest black student identified—and the one usually referred to as MIT’s first black graduate—is Robert Taylor, who entered MIT in 1888 and graduated in 1892. After his time, there were more than a dozen black students at MIT in the period

prior to 1920, entering at a rate of a little more than one every three years and including MIT’s first black woman student, Marie Turner (architecture, ’09).

During the second period, dating roughly from 1921 through 1954, the number of black students increased, although blacks were still most evident on campus in roles as cooks, waiters, and janitorial staff, along with the all-black porter service. Whereas earlier no more than one or two blacks had registered in a particular class, the class of 1923 had at least three, 1924 at least five, 1925 at least five, 1926 at least six, and 1927 at least three. (I use the qualifier “at least” to emphasize that these numbers are based on surviving documentary evidence that is incomplete.) The period 1921–1954 also saw the earliest blacks earn doctoral degrees at MIT—Victor Smith in chemical engineering in 1930, Marron Fort in chemistry in 1933, William Knox in chemistry in 1935, and Henry Hill in chemistry in 1942.

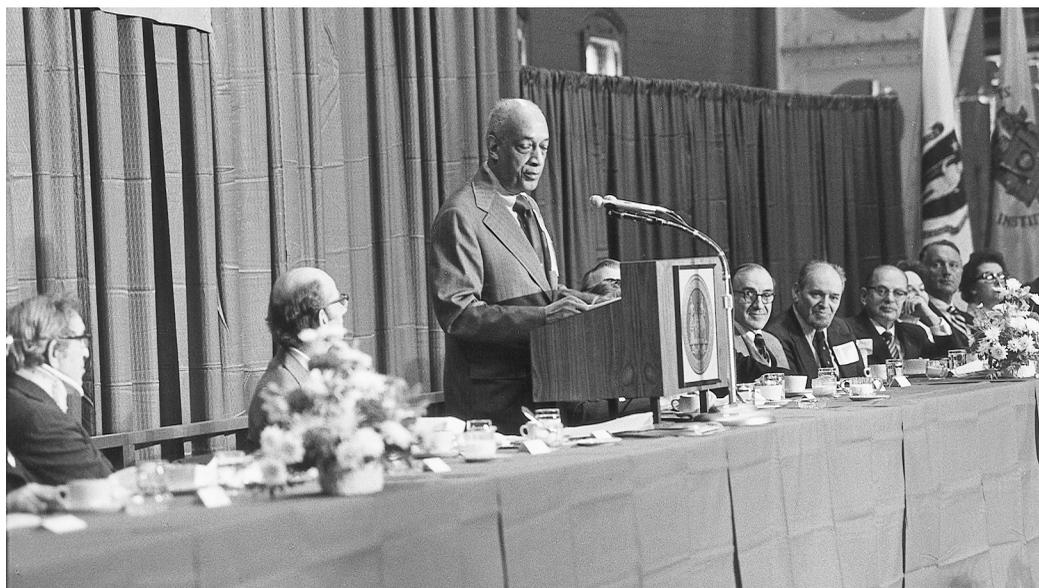

Service staff employed at MIT since 1950 join the MIT Quarter Century Club, 1975—Joe Green (Baker House) and Tom Hewitt (East Campus). Administrator Mary Hope converses with the honorees. Photo: Joe Schuyler

Other black MIT students during this period included Emmett Scott, ('21), son of the eminent African-American author, university administrator, and close associate of Booker T. Washington; and Lewis Downing ('23), who helped establish the School of Engineering and Architecture at Howard University and served as its dean for nearly thirty years. Later came Victor Ransom, who first entered in 1941 but did not graduate until 1948 due to military service during World War II. Ransom is the earliest graduate with whom I conducted an oral history interview, a transcript of which is printed in this book. I also interviewed his daughter Pamela, an MIT graduate student in city planning in the late 1970s (Ph.D. '80), whose reflections appear in the CD-ROM.

The number of black students at MIT declined in the 1930s and 1940s. There were still no black faculty, although Haitian-born Lionel Salgado taught French on a staff appointment during the 1949–50 academic year. The 1920s saw at least 29 black students, while in the 1930s there were about eight and in the 1940s about 11. This decline may have had to do with economic conditions during the Depression, possibly also with employment factors relating to World War II.

There was no social or racial issue or event that would have resulted in fewer blacks applying, being accepted at, or attending MIT, although this was a period when universities around the country—MIT included—were concerned about the relatively large and growing number of Jews on their faculties and in their student bodies, many of them refugees from Europe. Formal and informal quota systems, aimed at keeping in check the proportion of Jews to non-Jews, were discussed and sometimes implemented in universities and other institutions during this period. MIT, unlike Harvard, does not appear to have established a quota for Jewish students, but like many institutions at the time, MIT did limit the number of Jews on its faculty. In 1939, for example, MIT president Karl Compton wrote to a colleague in an effort to secure an academic post for a brilliant Jewish mathematician who had earned his doctorate at MIT: "I would have no hesitation in adding him to our own staff in either mathematics or physics, were it not that we already have as large a proportion of Jews in these two departments as we think it desirable to carry."

During the post-World War II period, Massachusetts and other states began to implement

Henry Hill (Ph.D. '42) speaking at the dedication of Building 66 (chemical engineering), the Ralph Landau Building, March 1976. Photo: Roger N. Goldstein

fair employment and fair educational practices legislation. Massachusetts had a Fair Employment Practices Commission in place by 1947, and discussion relating to fair educational practices continued into the early 1950s. MIT responded cautiously to these developments. Along with other university administrators, President Compton opposed the legislation as “unduly burdensome” on educational institutions and unlikely to have the desired effect. In his view, discrimination was “a matter of emotion, and we do not believe that one can legislate emotions.” While he agreed with the bills’ objective—the elimination of bias against prospective applicants for employment or admission to educational institutions—he also believed that the way to achieve it was through ongoing public education, not legislation. MIT, he said in 1947, “has no quotas, nor do we limit any group or groups because of race, religion, color, national origin, or ancestry.”

The state legislation motivated MIT to take an accounting of precisely what the employment and enrollment status and prospects were for blacks and other minorities at the Institute. It was

found—and these are figures for 1947—that 5.7 percent of MIT’s non-professional employees (93 out of 1,630) were black, consisting primarily of service staff. Only four out of 1,650 professional staff were black, a minuscule two tenths of one percent. Two of these professional staff, Lillian Russell and James Ames, were in the chemistry department, and one, a Mrs. Pierce, was in the Division of Industrial Cooperation. Ames had graduated in chemistry at MIT in 1937. There were four black students, including Victor Ransom and Yenwith Whitney (’49). There were still no black faculty. The Radiation Laboratory had had a few black staff during the war years, including physical chemist Warren Henry, but these were by and large temporary positions.

The growing national debate over racial inequities in education during this period culminated with the Supreme Court’s landmark *Brown v. Board of Education* decision in 1954, declaring the “separate-but-equal” doctrine unconstitutional. At MIT, the early 1950s saw much discussion of racially restrictive covenants in college fraternities. In an effort to make the campus environment

“Getting ready for a dry rush”—members of Delta Kappa Epsilon prepare for Spring Weekend. Exclusionary policies within fraternities were among the earliest factors to trigger discussion of racial discrimination at MIT and other institutions in the 1950s.

more welcoming to blacks, Jews, and other minorities, the Institute Committee (Undergraduate Association) passed a significant resolution in 1952, perhaps the earliest of its kind at MIT dealing specifically with discrimination on campus:

Fact: There are certain campus organizations ... which have discriminatory clauses in their charters or constitutions.

Declaration: The Institute Committee of M.I.T. stands opposed to racial and religious discrimination and deems it advisable to abolish all discriminatory clauses in the charters and constitutions of activities, organizations and living groups on the M.I.T. campus. ...

While some opposed this resolution and other attempts to legislate social attitudes, there was a growing consensus on campus that MIT should broaden its social reach. In 1952 a fund was established for “awards to worthy and well-qualified students who have demonstrated a democratic and tolerant spirit and who are well disposed toward people of all creeds and races.” By the early 1950s the rate of black students attending MIT had improved once again, roughly to the rate of the 1920s—not large numbers, but more than in the 1930s and 1940s. Among them was Gloria Green, likely the first black woman to attend MIT since Marie Turner in the early 1900s. This second period—1921 to 1954—concludes, then, with MIT apparently poised on the threshold of a new commitment to racial inclusion and tolerance, or at least to developing a strategy for dealing with issues of race.

The third period, roughly from 1955 to 1968, took place within a national context of increasing social consciousness and activism. Civil rights legislation was being debated and implemented on both the state and national levels. This was the period of Martin Luther King’s marches and his assassination, of national crisis over the Vietnam War, and of widespread confrontation over political and social issues. MIT’s response was relatively swift—swifter than that of many other institutions, in fact. The president at the start of this period, James Killian, held the progressive view that academic institutions had a “social responsibility” to fulfill.

In the aftermath of discussions about discrimination within campus fraternities, and in the wake of *Brown v. Board of Education*, MIT became one of the first institutions to host a conference on issues of discrimination in higher education. The pri-

mary initiative, as well as much of the organizing, was the work of students, among them Eldon Reiley ('55) and Reginald Griffith ('56) (white and black, respectively), whose memories of this conference and other aspects of life at MIT are included in this work. The conference, officially titled the National Conference on Selectivity and Discrimination in American Universities, convened over three days in March 1955. Speakers included President Killian and African-American scholar John Hope Franklin.

The rate of black students attending MIT, however, remained stalled at 1920s levels, and did not increase significantly until the late 1960s. The classes of 1967 and 1968 included eight and seven black students, respectively. While this was a modest improvement, in the 1967–68 academic year blacks made up less than one percent of the undergraduate population. The class of 1968 included Shirley Jackson and Jennifer Rudd (currently a consulting gastroenterologist), likely the first two black women to earn MIT degrees, both of whom I have interviewed and whose transcripts appear in this book.

The period from 1955 to 1968 also saw blacks appointed to faculty positions for the first time. Joseph Applegate served as an assistant professor of modern languages from 1956 to 1960, and as director of MIT’s new language laboratory toward the end of that period. While blacks had taught at the Institute earlier than Professor Applegate, none had achieved faculty rank. Other black faculty followed Professor Applegate in the 1960s, including Ronald McLaughlin, assistant professor of civil engineering, appointed in 1962; and Willard Johnson, assistant professor of political science, appointed in 1964. Transcripts of interviews with Applegate and Johnson are printed in this book.

Meanwhile, several non-black members of the faculty were active in scholarly or educational projects related to blacks. Among these projects were Harold Isaacs’s work on race in America, William Ted Martin on urban issues and mathematics education in Africa, the Fellows in Africa program (under Carroll Wilson), and Jerrold Zacharias’s work in improving science teaching in secondary schools. The MIT administration under Presidents James Killian, Julius Stratton, and Howard Johnson (a transcript of my interview with President Johnson appears in this book) also played a signifi-

cant role in the 1960s, establishing several task forces and committees to explore issues of recruitment, diversity, and educational opportunity.

Early efforts in this regard included the Committee on Community Service and the Committee on Education in the Face of Poverty and Segregation. In 1964, members of the Admissions and Financial Aid Committees urged increased contact with black high schools, ties with black organizations, and scholarships targeted for blacks. Out of a total of 743 high schools visited by staff and faculty in 1963–64, 31 were predominantly black. In the fall of 1964, 46 black schools were visited and staff began identifying promising black students in that pool. When the Committee on Educational Opportunity was established by President Stratton in 1964, its membership included a black MIT faculty member, Ronald McLaughlin. The Committee’s mission was to explore how the Institute might become more involved in tackling problems relating to race, segregation, integration, and related issues.

The Task Force on Educational Opportunity, chaired by Paul Gray, began its deliberations in 1968 and included input from Shirley Jackson and other black students. The Task Force on Equal Employment Opportunity was also established in 1968. Upward Bound grew out of the MIT Science Day Camp in 1965, and was designed to increase the retention and graduation rates of high school students at risk of dropping out, to increase the enrollment of these students in higher education, and to develop skills in academics, citizenship, and leadership. MIT served as host to a few race-related forums such as the Conference on Programs to Assist Predominantly Negro Colleges in 1964. These were among the initial steps taken during the period from 1954 to 1968 to make MIT a more inclusive, diverse community.

The fourth and final period, from 1969 to the present, saw these early ad hoc efforts transformed into systematic “affirmative action” programs for recruitment and retention of black faculty, staff, and students. It is the most complex, the richest,

“Youth Opportunity Program,” 1960s.

and the most controversial of the four periods outlined. There are so many activities, programs, committees, projects, and studies to be considered—all working generally toward a common goal, although often with differing approaches, outlooks, and philosophies—that it is difficult to know where to begin an analysis or even how to go about identifying the essential details. The fact that I became a participant in the story at this point (I arrived at MIT in 1972) gives me an advantage in the sense of having experienced many of the events first-hand, but it also puts me at a disadvantage in trying to step back from the material.

It is worth mentioning here, however, at least a few of the important issues and events. The essential groundwork was laid by the Task Force on Educational Opportunity, chaired by Paul Gray under appointment by President Howard Johnson. The Task Force's primary objective was "the development of programs that support the general

objective of expanding educational opportunity at MIT to include persons whose promise, talent, and potential have been masked or limited by secondary educational experiences, by poverty, or by social prejudice and discrimination." The Task Force was a broadly representative group, consisting of students, faculty, and administrators. Almost every phase of educational and career opportunities for blacks and other minorities—including our present undergraduate and graduate recruitment programs, efforts to increase black faculty and staff, establishment of the Office of Minority Education (OME), and other initiatives—had its origin in the deliberations and activities of this Task Force.

While the first years of the Task Force were difficult because of the sometimes confrontational relationship between black students and the MIT administration, a number of compromises and positive developments relevant to black students emerged, especially in the areas of financial aid,

Project Interphase luncheon, summer 1974; pictured (left to right) are incoming freshmen Cordelia Price, Douglas Evans, Vonetta Clark, Barry Grant, Diane Waters, and Leslye Miller; John Mims (top right), assistant director of admissions.

recruitment, cultural and social programs, residential concerns, and efforts to increase the number of black faculty and administrators. The first large influx of black students entered in 1969, as members of the class of 1973. Beginning in the late 1960s, blacks were gradually added to the ranks of the faculty—Professors Frank Jones, Willard Johnson, James Williams, James Young, Phyllis Wallace, Kenneth Manning, Wesley Harris, Cardinal Warde, Phillip Clay, Marcus Thompson, and others. The Institute was also served during this period by a growing number of dedicated black administrators, including James Allison, John Mims, James Bishop, Nanette Smith, Nelson Armstrong, Mary Hope, Brad Haley, Ben Moultrie, and the Turners, John and Cleverne. In the medical area we had the psychiatrists Donald Palmer and Chester Pierce, along with social

worker Myra Rodrigues. And there were a number of others, too many to mention here but well represented in the oral histories printed in this book or the CD-ROM.

Among the program initiatives of this period were Project Epsilon and its successor, Project Interphase, established in the late 1960s to enhance the preparedness of minority students entering MIT. Project Interphase started in 1969 and continues today as an eight-week summer program providing a rigorous academic schedule in mathematics, physics, chemistry, and writing, and a more leisurely and informal introduction to MIT and the Boston area. The Minority Introduction to Engineering and Science (MITES) program, founded in 1974, developed into a rigorous summer course introducing promising minority high school students to careers in engineering and science. Five

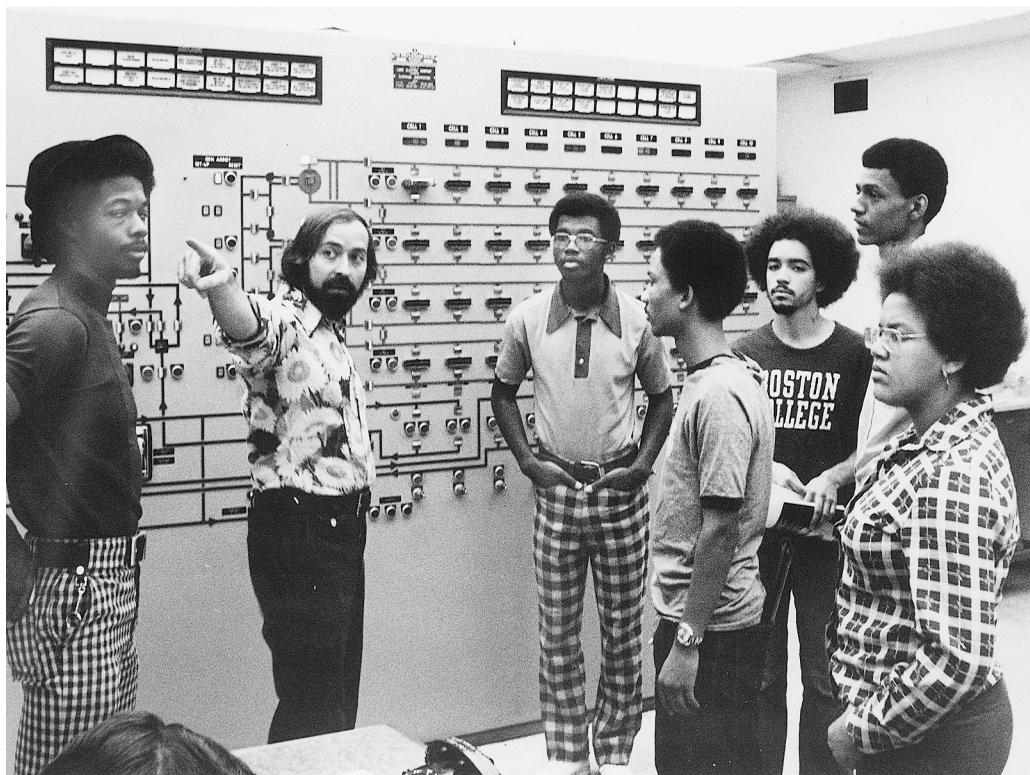

Chemistry instructor John Cross delights Project Interphase students with a demonstration, 1974.

MIT minority students were selected to serve as resident advisors that first summer—Nanelle Scott ('78), Inez Hope ('73), Gerald Adolph ('75), James Clark ('74), and Joseph Ogwell ('75). The physics department developed an exchange program between MIT and certain black colleges and universities, providing opportunities for black undergraduate students from these schools to spend time studying at MIT, with the expectation that at least some would eventually enroll in graduate programs here (the late astronaut Ronald McNair (Ph.D. '77) was part of this program). The Lincoln Laboratory Summer Program, created in 1974, also had the goal of expanding opportunities for undergraduates from historically black colleges. The Community Fellows Program, originally spearheaded by Professors Frank Jones and Lloyd Rodwin and continued under the leadership of Professor Melvin King, provided opportunities for

minorities to explore issues relating to the urban environment. The Office of Minority Education was established in 1975, following difficult negotiations between black students and the administration over competing needs and goals. Its mission includes participation in efforts to recruit and retain minority students, as well as implementation of programs to motivate academic performance and to help minority students adjust to the MIT environment. In 1975, MIT became one of the first universities in the nation to celebrate the birthday of Dr. Martin Luther King Jr. as an official holiday.

The equal opportunity program, designed to expand career opportunities for minorities and women at MIT, held much promise when it began in the late 1960s, but has never fully realized its hopes and expectations. The Equal Opportunity Committee (EOC) has nevertheless

provided an excellent forum for debate on how to increase the number of blacks at all levels of employment, especially faculty and staff. Several distinguished white faculty members served as chairmen or key members, including Albert Hill, Leon Trilling, Carl Garland, Michael Feld, Herman Feshbach, Philip Morrison, Jerome Friedman, Stephen Crandall, and Robert Mann. A number of these “bridge leaders” were interviewed for my project.

Black student groups began to flourish during this period, following the lead of the Black Students Union (BSU). The BSU’s founding members were Charles Kidwell (’69), Shirley Jackson, Ronald Mickens, Sekazi Mtingwa (formerly Michael Von Sawyer) (’71), Jennifer Rudd, Nathan Seely (’70), Linda Sharpe, and James Turner (Ph.D. ’71). Co-chairs in the first year, 1968–69, were Shirley Jackson and Fred Johnson (’72), with Linda Sharpe as attorney general/secretary. The Black Graduate Students Association (BGSA) and Black Alumni/ae at MIT (BAMIT) represented student interests in general ways, while Black Mechanical Engineers, Black Students in Electrical Engineering, and the MIT chapter of the National Society of Black Engineers (NSBE) combined social events with programs for professional and career development. These students developed an annual conference on science and technology in 1972. Chocolate City was established in 1975 on the initiative of three undergraduates—Glenn Graham (’77), Kevin Campbell (’76), and Albert Frazier

(’78)—as a predominantly black residential group, to “maintain our African–American community, promote our ethnic identity, encourage social and intellectual improvement, and provide support for our brotherhood throughout and after our years at the Massachusetts Institute of Technology.” The Gospel Choir, founded in 1972 by ten students who “just enjoyed singing with one another,” went on to develop ties with Christian groups both on and off campus and to donate proceeds to charitable causes, for example, a disadvantaged farm co-op in Mound Bayou, a black community in rural Mississippi. The Committee on Campus Race Relations, appointed in 1994 by President Charles Vest, was mandated “to catalyze activities, develop and distribute information on programs and resources, and administer a modest grants program to support projects proposed by members of the MIT community—with the goal of enhancing multicultural understanding and collegial race relations on campus.”

The list of initiatives, activities, and forums in this period could go on and on. While it is important to describe and document their activities, it is equally important to assess their impact. How effective have they been, either individually or collectively? Would they have benefited from better coordination? Have they managed to sustain momentum in the long run—and if not, why not? Such questions have no easy answers, but they should be explored because they get at underlying complexities—our successes and failures, opportu-

nities both seized and missed in pursuit of a diverse community here at MIT.

That's part of our challenge for a future book. The focus of the present book is to give voice to members of the MIT community, both black and non-black, whose reflections and insights on issues of race at the Institute are sharp, poignant, and instructive. The voices are numerous and varied, ranging from professors at the pinnacle of their fields to students about to start out in careers of their choice, from engineers to historians to physicians, from retirees to relative youngsters, and from those whose MIT experience was painful to those with mostly fond memories. It's an eclectic mix, a panorama of shared yet distinctive commentaries. It has much to teach us, I believe, about past, present, and future strategies to deal with race and racism in the academic context. I offer this book—this collection of voices, as it were—in recognition of the fact that human relationships are integral to the success of an institution like MIT, and in the hope that future generations will not just meet but exceed our standards and expectations.

THE ORAL HISTORIES

Transcripts of selected oral history interviews make up the main body of this book. Initially, my plan was to interview around thirty individuals, a sample divided roughly among students, faculty, and administrators. That number eventually grew to 223. See Appendix A, Project Methodology, for a summary of interview methodology; Appendix B for a list of interviewees, people whose interviews appear in this book or in the CD-ROM. Printing all interviews would have resulted in more than one volume. As this was not feasible, it was decided to publish the remaining interviews in a CD-ROM format, simultaneously with the selected interviews printed in this book.

The interviews convey personal assessments, ideas, and suggestions about the role of blacks within the MIT context and beyond. Often they amount to complete life histories in a nutshell. Included at the start of each interview in the book (but not the CD-ROM) is a biographical note on the interviewee, providing the reader with some

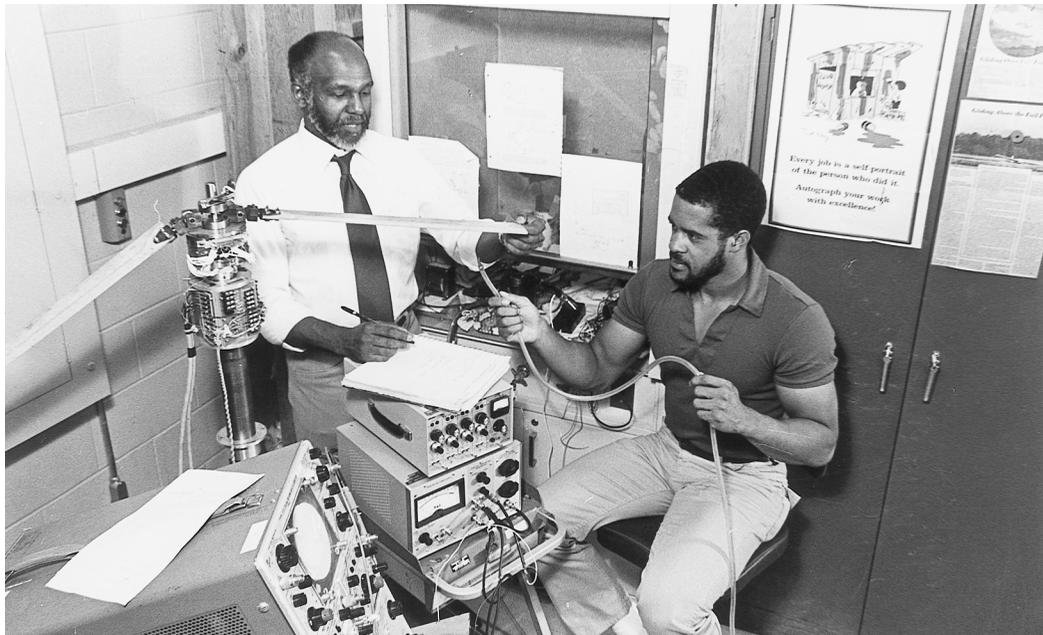

Gospel Choir, early 1970s. Photo: Calvin Campbell

context for what follows. Most interviewees were black students, but black faculty, administrators, and staff were also represented. Non-black faculty and administrators, some of those whose role at the Institute has had an impact on blacks at MIT, were included as well. The interviews are loosely arranged in a single chronological sequence, according to when the individual entered MIT as a student (black students), was hired at MIT (black faculty and administrators), or first became involved in issues relating to blacks at MIT (non-black faculty and administrators). I think this structure will help the reader understand how the black experience at MIT evolved over time.

It was difficult to decide which transcripts to include in this book, since all are rich in insight and narrative detail. The decision came down to an intuitive impression of which ones, when read together as a group, would reflect and portray the broadest range of issues and personalities—a roughly representative cross-section of interviewees by time period and category (student, faculty, staff, and administrators). While the themes covered depended to some extent on the individual

interviewed, I tried to have everyone address the following: family background; early education; role models and mentors; racism and race-sensitive issues; choice of field and career; goals; adjustment to the MIT environment; best and worst experiences at MIT; assessment of support services; relationships among MIT students, faculty, and staff; advice to those who are either at or might come to MIT; and advice to the MIT administration.

One recurring theme, role models and mentors, requires an additional word of explanation. Although in certain instances the terms are used interchangeably, there are important differences. Role models are impressive and important figures, often viewed from a distance. You can admire, emulate, and even worship role models, but they do not necessarily know you exist—and, if they do know, they make no commitment to your development, exerting influence by example, rather than direct advice or caring about you as an individual. Mentors, on the other hand, are counselors or advisors, taking an active role in one's educational or professional development. To be effective in an environment like MIT, a mentor generally

Professor Wesley Harris and assistant professor James Hubbard collaborate on an aeroacoustical study, February 1982. Photo: Calvin Campbell

has stature within the hierarchy, is a recognized authority in his or her field, has a genuine interest in the personal growth and development of the protégé, and is willing to commit time and energy to the relationship.

With these themes in mind, it is important to summarize here what the interviewees most wanted to relate about their experience at the Institute, and if possible, to identify common experiences that emerge. While generalizing about people's experiences is never easy, the interviews reveal patterns, some of which are more or less unique to certain periods and some of which recur across periods. Among the most common is the feeling that MIT, rigorous as the experience was, instilled confidence to deal with just about any problem or hurdle in professional life; additionally, the graduation ring featuring the MIT beaver, Nature's engineer—the “brass rat”—opened doors and supplied instant credibility.

Black Students, 1941–1954. This tiny subset of black MIT students came by and large from eco-

nomically disadvantaged backgrounds, usually Depression-era black communities in the rural South or urban North. They grew up during a time when racial segregation was the law or practice in many parts of the country, when consciousness about civil rights was still in its infancy, where racial hostility could be crude and direct, and with the knowledge that their prospects were limited due to their race and that their struggles to succeed would likely be more difficult than those of their non-black counterparts.

Nevertheless, they learned early in life to believe in themselves. They were motivated to think of education as a path to personal and professional fulfillment. Nearly all benefited from the encouragement, support, and firm but sympathetic pressure of some core group—parents, other relatives, neighbors, teachers, people in the community. With such backing, poverty and racial conflict were seen not as obstacles or handicaps but as sources of strength, challenges to be overcome through hard work and persistence. Nearly all encountered discriminatory practices. However,

Early black alumni at a reunion—(left to right) Arthur Blackwell ('51), Robert Pinckney ('52), Herbert Hardy ('52), and Ernest Cohen ('64).

these individuals were determined not to permit racial discrimination to discourage or embitter them or to distract them from their goals. Few and isolated as they were, they found ways to adapt to MIT's potentially alienating environment, to develop relationships with non-black professors and others on campus, to remain focused, and to come away with the technical knowledge and social skills to pursue careers in the outside world.

Black Students, 1955–1968. These students were similar to the earlier group in family background, motivational drive, and community reinforcement. Where they differed most was in their level of political consciousness. Students from this second period, particularly those who entered MIT in the mid- to late 1960s, grew up during the civil rights era—the Montgomery bus boycott, lunch counter protests, the March on Washington, the passage of federal civil rights legislation, the rise of the Black Power movement, and the assassination of Martin Luther King, Jr. As a result, they were politically

more radicalized and less likely than their earlier counterparts to find comfortable, productive relationships with non-black faculty at MIT. The MIT community felt more racially polarized to them, and they viewed racial prejudice as an issue to be confronted head-on rather than placed to one side in the interest of furthering academic or career goals. These students, in short, focused as much on social principles as on academics. In their isolation, and still very few in number, they bonded to develop networks of social and academic support within the MIT community and outside, from fraternities and sororities to residential groups and religious activities.

These were also the activists whose ideas and pressure on the MIT administration laid the framework for hiring more black faculty and staff, and for the establishment during the late 1960s and early to mid-1970s of educational and recruitment programs directed primarily at minority students—Project Epsilon, Project Interphase, Minority Introduction to Engineering and

Recruitment drive—minority high school students bused to MIT, November 1972. The program was the brainchild of assistant director of admissions John Mims (second left). Photo: Marc J. Pokempner

Science (MITES), and so on. Even today they are among the most vigorous advocates of minority intervention programs, alert to the importance of periodic evaluations to address changing needs.

Black Students, 1969 to the Present. These students share characteristics with earlier groups—innate ability, motivation, and effort supported by a close-knit family or community. They differ, however, from their earlier counterparts in several respects. First, the number of black students increased considerably on-campus during this period. Secondly, they came up in newly “integrated” school systems that provided fresh opportunities, yet at the same time compounded racial tensions. Many were caught between two worlds—the predominantly white (or mixed) schools where they spent part of the day and the still segregated black communities where they spent the rest of their time. While this produced some problems—both academically and

personally—others found balanced and gratifying educational opportunities in environments where academic resources were better than in the all-black public schools, while sustaining roots in their black communities. MIT students who entered in 1969 and later came increasingly from upwardly mobile backgrounds with expanded opportunities.

This group also had options in higher education that their earlier counterparts lacked. Since the late 1960s, more black students could consider attending quality universities such as Harvard, Yale, Princeton, Stanford, and MIT—as well as desegregating, previously all-white institutions of higher education in the South—in addition to HBCUs such as Howard University, North Carolina Central University, and Morehouse College. MIT attracted a number of these students as a result of an outreach and recruitment program begun in the late 1960s. Outstanding candidates for admission to MIT were flown or bused to campus in the spring of their senior year to familiarize them with the academic program and other activities, and to encourage them to consider MIT.

Programs such as Project Interphase and the Black Students Union (BSU) Tutorial Program promoted a friendly, non-threatening, academically helpful environment and brought black students together, building on the close-knit relationships which earlier students had initiated and which the central administration had supported. Also, with the arrival of some black faculty beginning in the late 1960s and early 1970s, students found satisfaction in taking their courses, or simply in the awareness that there were blacks at that level on campus and that others were beginning to enter the Institute at new levels of responsibility. Even if their paths never crossed, black faculty and administrators proved encouraging, sometimes even inspiring to students through influence and example. Yet many students were disappointed that the number of black faculty serving as role models, advisors, and advocates at both the graduate and undergraduate levels remained small. A number of students went through MIT with only superficial contact with faculty members of any color, black or non-black.

All in all, though, the MIT climate struck these students as promoting high standards, flexibility, and experimentation. More than in the earlier periods, students who entered after 1969 with a single idea of what they wanted as a field or career, discovered new interests and options they

had never before considered. This is due partly to the evolution of MIT's curriculum and partly to the fact that these students discovered fields unknown to them before arriving at MIT.

Racial issues still remained. Of special concern was the tendency of non-black faculty and students to assume that black students were either deficient in preparation or less capable (or both) in quantitative areas—a stigma with particularly negative consequences in an institution like MIT, which places so much weight on achievement in science and technology. In fact, black students from this period—no matter how good their academic background, credentials, and performance—generally had the impression that non-blacks considered them special cases who would never have been admitted were it not for “affirmative action.” This was not an issue that black students from the years before 1969 had had to confront; it produced mixed reactions among the students after 1969—at times anger and frustration, at times reduced self-confidence, at times a determination to rise above it all and “prove them wrong.”

Responses to racial issues varied depending on students' country or region of origin. Foreign black students (Africans, West Indians, Latin

Americans, and others) appeared to adjust better than African-Americans, to respond more in the way African-Americans in the first period had responded—that is, by refusing to allow negative racial feelings or attitudes to prevent them from focusing on educational priorities or from working toward meaningful relationships with non-black students and faculty members. This sometimes caused difficulties between foreign black students and African-American students, with African-Americans sometimes labeled as paranoid and hypersensitive, of having their “amplifiers turned up so high that any little thing gets blown into race.” While foreign black students also experienced poor treatment based on color, they noted differences based on place of origin as well. Yet foreign blacks were treated with more tolerance than African-Americans. The tendency, however, was still for foreign black students to push the issue to one side in the interest of academic priorities, while racial principles remained central for African-Americans. This difference in outlook highlights cultural differences, including the effects of long-term versus short-term exposures to racial discriminatory practices within the American culture. Foreign blacks generally grew

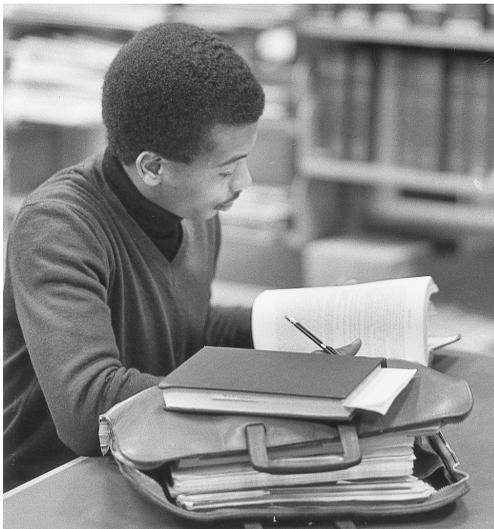

Black Students Union members team up on the basketball court. Photo: Bradley C. Billetdeaux

up in societies that, unlike the United States, are either all-black, as in Africa, or multiracial but without a recent history of segregation.

The belief among a number of black students from this period, particularly on the undergraduate level, is that there is not enough dialogue between blacks and non-blacks concerning race at MIT. The opportunity to modify racial perceptions and stereotypes, and to establish avenues of interracial communication, is left too much to chance. It is unlikely that the students would ever again find themselves in as potentially productive an environment as MIT, as far as promoting race relations is concerned, and there is an overall feeling among students of lost opportunities in this regard. On the other hand, in spite of ongoing racial issues, black students from this period exhibit deep institutional loyalty and pride. Some of this arises from MIT's rigorous and, some claim, uniquely challenging academic program, but it also relates to the success that black students have had in generating minority solidarity through clusters such as the "Chocolate City" living group, fraternities and sororities, and professional and religious organizations.

Several key points emerged from students' testimony overall, across all periods. The following

A time for deep study—Sloan School of Management student Kenneth Armstead in the library, early 1980s.

summary includes illustrations quoted from some of the interviews.

From nearly all accounts, black students interviewed felt that the MIT experience was painful but worthwhile. This appreciation increased the further away in time they were from the experience, which seemed more like an ordeal than a benefit when they were actually going through it. After leaving MIT, a sense emerged that the experience had provided them with the confidence and toughness to handle just about any problem. Several black former students referred to the experience as going through "boot camp" and others considered surviving the experience worthy of a kind of "red badge of honor." Gerald Baron ('85) said MIT "has helped me with confidence. There are a few things that I learned at MIT. One was that because I got through, I gained a confidence that I could deal with any situation that was thrown at me, any new challenge or opportunity." Doing well at MIT provided confidence in another way, according to Lisa Egbuonu-Davis ('79), who indicated, "There were many semesters where I had class highs. Certainly, I have known plenty of people who I thought were incredibly brilliant, but I could play with the big boys. That kind of core confidence was in fact the strongest benefit I got from going to MIT—that and the expectation about access to power." The pain and quality were noted by another student: "I have to say that it was painful at the time," said Lynne Richardson ('76), "but educationally MIT really was my best experience, just in terms of the quality of educational services." After years away from MIT, Sekazi Mtingwa ('71) assessed the experience this way: "MIT was good, I think it was a great experience.... I may have gone on record as being critical, but now I have a chance to look back and say, 'Ah, So-and-So was right about this, about that.' I'm getting old. You appreciate things." Similar benefits were expressed by other black graduates.

For a number of black students, developing successful ways to deal with racist attitudes, discriminatory actions, and other negative elements in the academic and living environment was crucial in surviving the MIT experience.

Developing a supportive network was essential for many who had been top students in high school, but who had to work hard to rise above average at MIT. There was a tendency to believe, when they entered MIT, that they would not find

the experience academically challenging. But many did, especially during the first year, and networking—through living groups, study groups, and so on—helped get them through: “The one semester I did live in Chocolate City,” said John Hammond (’84), “that felt best to me because I felt I had a place that I could come home to where people were doing what I know people do when they come home—watching TV or sitting around together doing homework.” Kristala Jones (’94) spoke about her freshman year: “Freshman year was really important to me because I did do very well both semesters. It gave me tremendous confidence for the rest of the time that I was there. I was also really surprised that I could find and get so rooted in the black community almost immediately.”

Many students, among them Thane Gauthier (’94), pointed out the importance of a critical mass of black personnel—faculty, staff, and administrators—to develop, sustain, and supplement the support system: “[P]rovide the support and the resources and administrators and faculty who we can talk to about these problems, and make sure they’re always there.... Make sure you have minority faculty, minority administrators, minority students there who I can commiserate with and talk to and who can give me advice and question my beliefs and ideas, because that’s the only way that I’m going to grow as a person. That’s the only way some of my ideas are going to change—if somebody questions them, if somebody I respect questions them.” While Robert Satcher (’86) described a number of positive aspects about his MIT experience, he had this to say about what was worst about it: “The bad thing about MIT is that there weren’t more black people on every level. You sort of feel a certain sense of isolation, which feeds into making things a little more polarized.” Gregory Chisholm (’73) emphasized the impact of black faculty: “Jim Williams, I think, was very important to me. I had a course with Jim in my sophomore year, and Jim was the only person at MIT who said to me, ‘You’d better stop fooling around with a lot of stuff and get your work done.’ Jim could cut through stuff and just sort of lay it out. He said, ‘Well, this is what you need to do.’ And nobody else at MIT ever did that.”

In later years, particularly the 1990s, relatively more black students stressed the importance of support networks that included non-black students, faculty, and administrators. Recent black

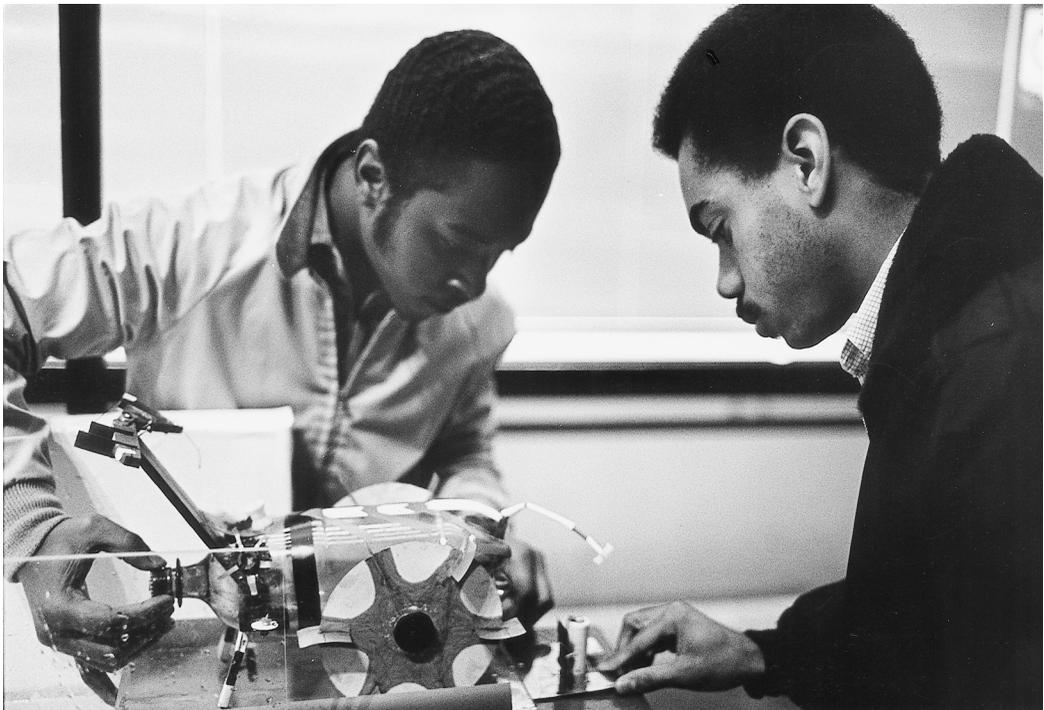

high school graduates have, after all, come through a system that is more racially integrated than that known to the earlier black pioneers, particularly in the 1970s and before. The trend reflects a growing tolerance and diversity that many educators have pushed for in higher education as the means for our society to bring equality to all of our citizenry. The best networks, some students feel, know no racial or ethnic boundaries: Milton Roye (’79) suggested, “My advice would be to meet and interact with as many different types of people as you can.... I got involved, although not planning it, with the Inter-Fraternity Conference, which led to a lot of work with the dean’s office and some other commissions. It introduced me to a wide, wide variety of people. It gave me an experience base that you’ll never get with just studying and getting good grades.”

Other black students had felt very close to their black student community, but pointed out that they also made an effort to communicate with non-black students and MIT personnel—especially white faculty. In fact, Jennifer Rudd (’68) appreciated the hospitality shown by white faculty in the early 1970s: “I think the person who had the biggest impact on me was my freshman advisor. His name was Ned Holt. He was a faculty person in the biology section. He had us all to the house, the whole group of us in his advisory group. I got to meet his family and his kids and so on. I remember going to him when I knew I failed that electricity and magnetism final.” Reginald Van Lee (’79) observed: “[T]he racial issue was not a big issue with me either, and I managed to have both black and non-black friends—but still clearly identify with being black.... Those friendships meant a lot to me. I loved MIT. I had a great time.” A number of black graduates, like Darcy Prather (’91) and Linda Sharpe (’69), emphasized that incoming black students should take care not to isolate themselves and to tap into as many academic opportunities as possible, developing close contacts with black and non-black professors and students.

In the opinion of many black students, a key to academic success is not to be shy about asking for help early in the freshman year, even if a student may always have done well and never before needed help: “[T]he environment at MIT,” says Samuel Austin (’81), “is one that I describe as a Darwinian atmosphere—you know, the strong will

survive. It's not particularly an atmosphere where you feel comfortable saying, 'I need some help' or 'I'm not sure that I have the tools.' You're a little cautious looking around at who you can ask for help. How to go about doing it is not clear. Therefore, because of that, once you're behind you tend to stay behind, and it's harder to catch up." My son Alton Williams ('91) gave this advice: "[T]ry to find someone who's doing exactly what you want to do, or similar to what you want to do, because there will be knowledge and information that they will know and that can prevent some potential errors and pitfalls." Gerald Baron, now a very successful black senior businessman, expressed this point best: "It was hard for me as a freshman to get used to asking for help, because I was used to being at the top of my class and I didn't need help to succeed in my grades. At MIT you can't succeed without help and I didn't know how to deal with it. A key to my success was understanding that I didn't have to be right all the time and I didn't have to know all the answers."

Many students underwent stress at some point in their experience here, particularly doubts about whether they had made the right decision by coming to MIT. These doubts, often related to loss of confidence or academic difficulty, were eased by assurances on the part of faculty and staff that anyone who was admitted did indeed belong, as well as by reinforcement from their own families and communities. Paula Hammond ('84), now on the Institute faculty, had this to say: "I'd say for those times when the self-esteem is plummeting, you almost have to train yourself to understand that this is something that will happen sometimes. You have to learn to recognize the situation and maybe find some backup for it. You have to find some backup people. People always make you feel that you are capable and they may not always be the people at work... You also have to find a way of reminding yourself that you have always been capable in your life." My son Clarence Williams, Jr. (SM '94) expressed similar thoughts: "I would say that it's important to have a foundation and a belief

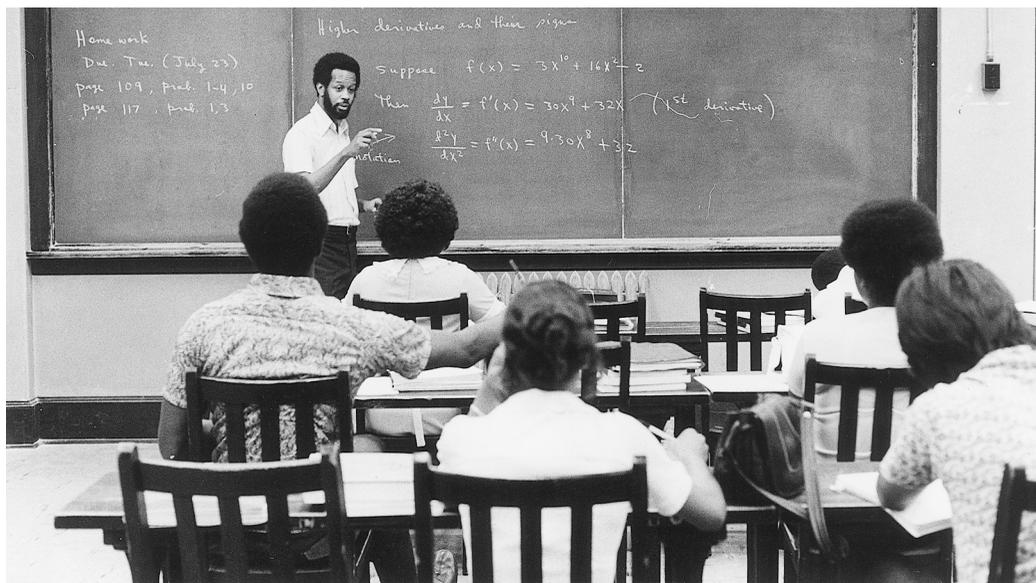

The 2.70 Competition, 1981—rigors of training in mechanical engineering. Photo: Bill Hofmann

structure in yourself, and not to get discouraged when things don't necessarily go the way you feel they should go...you need to be able to draw on that inner strength and to seek out people like my father who have in all likelihood experienced similar things that you're experiencing, if not worse, just by the nature of the historical development of this country." As Napoleon Nelson ('74) noted, "I was co-valedictorian of my high school class, hot stuff in Birmingham, and took that plane ride. And all of a sudden, I'm like nothing. I go from owning the world to being nobody."

Students feel strongly that the minority community must preserve its identity without isolating itself from the larger community—which to some people, blacks and non-blacks alike, seems like a conflicting, contradictory goal. James Williams ('67), later a faculty member, said it well: "[I]t's a battle that I have already lost so many times on this campus.... The battle, or the way that I have seen the battle, is that there should be some connection and strong understanding and appreciation of a minority community and how we can support each other, but at the same time, not to close ourselves off—in particular at the student level—from the broader community. I find myself battling with the undergraduates to get to know whites better—

not to leave Chocolate City, but to get to know whites better. Students and administrators and faculty may listen to me talk at different times, and they may say this guy doesn't really know what the hell he is saying. He's saying everything and doesn't know what he's saying. My message to students is going to be a very different one from my message to faculty or graduate students." This advice is echoed by other students who were interviewed in the project.

Students urge MIT to continue the efforts in minority student recruitment and retention that have evolved during the past thirty years. They view the strategy as producing results, and encourage MIT to stay the course despite contrary pressures. Some, like Gerald Adolph ('76), argue institutional responsibility in preserving affirmative action against assault: "[A]s we move into an environment now where it is only a matter of time before the forces of darkness turn their attention from the public institutions to the private institutions in their attack on affirmative action and race-based components in admission, it's going to become even more important to be willing to stay the course. There are a lot of things that MIT can do that lesser institutions can't do.... MIT is capable of building a program for

Floyd Williams, instructor and lecturer in mathematics, 1972–1975.

Budding romance—contrary to popular belief, a number of students have discovered lifetime partners at MIT.

minorities that is coherent, that makes sense, and that allows you to defend diversity in the classroom. I think that's going to be the next big battle coming along"; "[O]ne of the big problems that MIT had when I was there," says Philip Hampton ('77), "is that you did not have enough black folks.... There needs to be a diverse community of black faculty and staff people, since we, as a people, are not monolithic.... I think MIT should, again, focus more on the entire African-American and minority communities.... Again, we need our community at MIT as diverse as the black community in this country is."

Black Faculty. The background of MIT black faculty parallels that of black students in several respects. A central theme in the early education of both groups is a strong family support system—usually mother or father, or both; or failing that, community and neighborhood support—consisting of a determination to prioritize academics at a very early age. Family or concerned community members often came from limited educational backgrounds themselves, which made them all the more determined to ensure that the next generation would be exposed to opportunity. Although many had been held back by racial discrimination in their own lives, they instilled in their children a sense of the “right stuff,” emphasizing that racism should be viewed as a challenge that could be conquered rather than a barrier.

Nearly all members of the black faculty group were identified as exceptionally talented at an early age. On account of being bored or under-challenged, they were sometimes troublemakers (James Williams was one), but fortunately they encountered one or more significant influences—a concerned neighborhood, teachers, other positive role models or mentors—who helped set them on the right track in much the same way as professional sports stars have been groomed to succeed in sports. On the basis of excellent academic performance, and with the help and encouragement of family and teachers, many were selected to participate in programs for the academically gifted that started them on the path to outstanding academic careers. Those who grew up in the late 1960s or earlier generally came from all-black communities and attended all-black schools, although a few entered predominantly white schools as pioneers at the start of

desegregation; younger ones attended post-integration schools, which could be either mostly black, mostly white, or mixed. In general, these accomplished scholars earned undergraduate and graduate degrees at the most selective colleges and universities—Harvard, Johns Hopkins, Princeton, MIT, and elsewhere—before being offered faculty posts at MIT. A common characteristic is that they took risks and accepted challenges at an early age, whether it meant venturing beyond a small segregated town to attend a summer program in competition with students nationwide (Kenneth Manning) or giving up high school for the Merchant Marines and discovering one's life calling in the process (James Hubbard). Being recognized early on in precollege and college by their peers and adult leaders as student body presidents (Phillip Clay and Willard Johnson) was quite common among this group. In short, they tapped into unusual inner resources and these qualities were recognized by their peers and mentors.

Black faculty members who went on to achieve tenure and senior rank at MIT usually developed close ties with non-black faculty members who, because of eminence in their own fields, were in a position to serve as effective mentors and

advocates. Such relationships proved to be critical—along with scholarly achievement, teaching performance, and Institute service—in successful progress along the tenure track; when these relationships failed to be developed early in a career, the likelihood of success was less. Faculty members who ended up being denied tenure or who left for other reasons often attributed their failure to poor mentoring, inadequate advice, or hostility and indifference on the part of senior non-black faculty members at MIT (for example, Monroe Little). While one could argue that this is the case with all junior faculty members regardless of race, the problem is more intense in the case of black faculty members, as a result of their relative isolation and limited access to professional contacts and networks that count.

Another often unnoticed issue that needs further exploration is the apparent sacrifice made by black women who pursue their doctorates and become faculty members or high profile professionals. Samuel Myers (Ph.D. '76), now a distinguished economics scholar, made this observation, “I've looked at the statistics on faculty and there's far, far fewer married women—married black women—among Ph.D's than there are among

A meeting, early 1970s—among the earliest black administrators were Mary Hope and James Allison (at right); at left is director of student financial aid Jack Frailey. Photo: Pete Buttner

black women in general. There's got to be a reason. Men, they're married and they're divorced, but a lot of women out there have had experiences that are quite different. It's kind of hard to go through the MIT experience and be a woman and also be married.... I hope that you will explore that a little more deeply—whether or not family and marriage are incompatible with the nature of the MIT experience, except in those instances where they are both graduate students.”

One key feature of the senior black faculty, and often the junior faculty as well, is their distinguished record of research and scholarship—fundamental contributions in their fields ranging from basic discoveries to technical applications to influential texts. They have also contributed to policy-making, both at MIT and outside, on matters relating to education and research, including but not limited to minority issues. Simultaneously with this commitment to service, black faculty have brought a level of energy, quality, and achievement to their teaching and research that matches or exceeds that of their non-black colleagues. The impression among blacks that they

need to perform at a level higher than whites if they are to be recognized as equals, is as widespread at MIT as at other predominantly white institutions.

Black Staff and Administrators. Black administrators at MIT in the late 1960s and 1970s, like black students, came from families that strove for achievement through education and a strong work ethic. Their values were grounded in family and the black community. Alongside a spirit of pride and determination developed during the civil rights period, they never doubted that they owed their positions at MIT to social engineering and the push for “affirmative action.” This was particularly clear to those administrators who came to MIT during the late 1960s and early 1970s.

The earliest black staff and administrators at MIT in the late 1960s and early 1970s are notable for the energy with which they worked to establish support networks for black students and staff, to advocate and monitor the central administration's affirmative action program, and to promote self-reliance and cohesion within the MIT black

Five minority administrators—John Mims, John Mack, Eduardo Grado, Nelson Armstrong, Clarence Williams (clockwise from right), with J. Samuel Jones, associate director of student financial aid, mid-1980s. Source: Clarence G. Williams

community. They faced enormous pressures. They were drawn in sometimes conflicting directions—expected by the central administration to come up with immediate information and quick solutions to black-related issues, immersed in recruitment activities both on and off campus, and buffeted by students who knew exactly what they wanted and how they wanted it done. It was next to impossible to carry out this balancing act, especially in an environment where a critical mass of black personnel had yet to be hired. Few black administrators stayed long at MIT.

Those who came in the 1980s and 1990s were somewhat different. While they had as strong family, educational, and work values as the earlier group, they were less unified in racial identity and more divided about issues of personal achievement versus racial preferences. As they spread out to areas of the Institute where blacks had never before exercised influence, their jobs were less often identified with minority causes. Under these circumstances, they seemed to find unity within the black community of less importance than the earlier group. As black administrators from the later period have uncovered new opportunities in the institutional mainstream, they have found it more difficult to position themselves behind “black” causes and issues.

A pattern evolved of black administrators coming to MIT in supervisory and non-supervisory positions, and, despite good performance records, either leaving the Institute after fewer than ten years or remaining with minimal supervisory responsibility. Generally, black administrators consider themselves at least as qualified for senior positions as non-blacks in comparable positions, yet there is a widespread feeling among them that there exists an informal “two-track” system in which non-blacks receive the mentoring and nurturing necessary for promotion and recognition, while blacks do not. James Bishop alludes to this:

One of the things that seemed very clear to me was that white administrators cared for some people, mentored some people, and supported them extremely well—and they moved up the ranks. Howard Johnson was a strong supporter and a mentor of the late Constantine Simonides.... Jim Culliton was, I think, very strongly supported by John Wynne.... And I'll give you the name of one other person—Kathryn Lombardi, now Kathryn Willmore, who's secretary of the Corporation and vice president. All the people I've named, I think, are very competent. I like them all, I admire them all, and I'm not saying anything against them.

But I'm noting that that's an example in a place like MIT where having a strong mentor is very valuable. The question is, Has the institution provided those same honest, caring mentorships to African-Americans over the years?

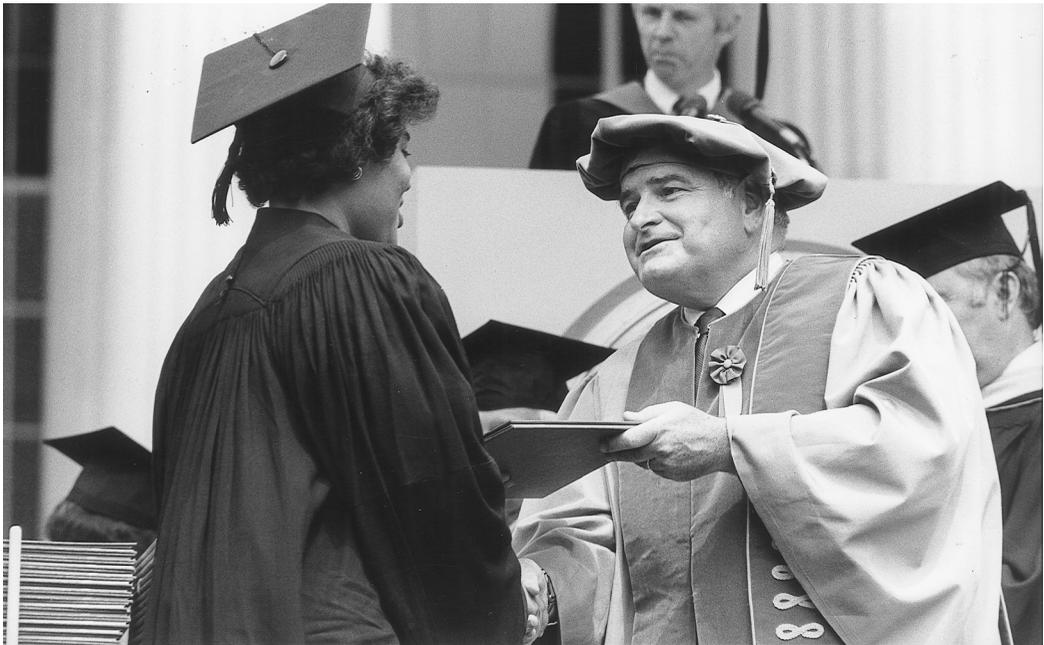

As a result of pressure from black students during the 1970s and 1980s, black administrators tended to be assertive advocates to the central administration on behalf of the needs of the black MIT community, especially students. As a result, support structures are in place for the 1990s and beyond. Yet black administrators since the 1980s have detected a pattern of change at MIT, from support to a “state of flux.” Often they felt that MIT paid lip service to affirmative action, but achieved limited results in either recruitment or outreach to its minority community. Also, there has been little cohesiveness among black administrators since the conferences on Issues Facing Black Administrators at Predominantly White Colleges and Universities in 1982 and 1984. One black faculty member (Mel King) attributes this to over-reliance on the “two I's,” isolation and individualism, which compromise community goals. The trend seems to reflect the mood of the nation in some ways, away from social conscience and advocacy and toward individual self-reliance.

Non-Black Faculty and Administrators: “Bridge Leaders.” The non-blacks included here, both faculty and administrators, are among what I like to call MIT's “bridge leaders”—a small, core group that has been instrumental in making MIT a more welcoming, nurturing environment for blacks and other minorities. The “bridge leader” idea is similar in a way to Elihu Katz and Paul Lazarsfeld's “opinion leaders” and Thomas Allen's “gatekeepers” as laid out by these leading scholars in the field of organizational theory and psychology. Katz and Lazarsfeld identified “opinion leaders” as a group highly attuned to sources of information both within and outside of their immediate environment and able to attract co-workers who seek them out for information and advice. Allen's “gatekeepers,” similarly, share what they have learned through exposure to ideas and ways of thinking beyond a narrow community.

Following that pattern, the non-black faculty members and administrators represented here are important not only for their contributions to promote equal opportunity and positive race relations, but also for the motivation underlying their

actions—the fact that they became involved voluntarily, not as the result of an assignment or professional duty but from the conviction that it was time for a change, or because they felt compelled to act out of an impulse of “common human decency.” Many came out of traditions—religious, political, or non-specific humanistic ways of thinking—in which “human decency” and social consciousness are fundamental values; some are well known to the overall MIT community and most are eminent figures in their academic departments or administrative support areas. Generally, they have excellent interpersonal relations within their working groups. They act and respond to people of color and racial issues as they would in most other situations—initiating strategies and leading by simple democratic principles, often in ways unrecognized by the MIT community at large. To them it is natural to promote good race relations on campus, and this deserves no special notice; it is a way of life for them, a matter of “right” choices and principles—“[A]ll I’ve ever done in my own humble view,” observes Daniel Langdale, “is treat these [minority] kids at least as well as I ever treated a white kid.”

Members of this small group of “bridge leaders” generally agree that one of our fundamental goals should be an integrated society in which everyone has an equal chance regardless of race. Some even believe that MIT has a responsibility in this regard, that progress toward social goals such as racial diversity must involve institutions like MIT “acting affirmatively” to avoid separatism within our workplace and society (Charles Vest). “Bridge leaders” understand the need for a sense of community and belonging that minority people seek in a working and learning environment, and they demonstrate this understanding through their words and deeds. They tend to be optimistic about race relations. While they have been active in their individual ways, and continue to try to make a difference in their own circle of contacts both at work and in civic affairs, they recognize how much remains to be done in race relations. We need “greater progress,” they believe, not just in obvious ways such as recruitment, but also in combating what physics professor Herman Feshbach calls “hidden bigotry,” prejudice that limits the effectiveness of efforts to diversify the faculty and student body.

President Paul Gray warmly congratulates a student, June 1985. Photo: Jim Harrison

The “bridge leaders” stand on principle and act differently from the non-black norm. Often there is little fanfare around them, especially in the faculty ranks (examples are Michael Feld and Mildred Dresselhaus) and middle management (for example, William Hecht and Doreen Morris), yet black and other underrepresented minorities—whether within or outside of their working groups—know who they are and go to them for advice. The “bridge leaders” are known for their sense of fairness in dealing with race. While this trait may have had a basis in family and early education, or as a result of political or religious beliefs, often it emerged because of increasing contact with blacks. Former MIT president Paul Gray (an exemplary bridge leader), for example, one of the Institute’s central figures in race relations over the years, did not consider race an important issue until he was assigned a role in the late 1960s as chair of MIT’s Task Force on Educational Opportunity. By contrast, another former MIT president—Howard Johnson (also an original bridge leader)—had lessons much earlier in life, including a memorable one from his mother about the respect he should show his elders, black and white alike.

“Bridge leaders” show a willingness to learn from black and other minority students and professionals, earning, as one put it, “the rough equivalent of a Ph.D. in interracial relations.” Through observation and interaction, they grasp the psychological pressures and tensions unique to black students and professionals. They have a better understanding than the typical non-minority person of the additional demands placed on black and other minority students and professionals in the classroom and workplace. For example, blacks must perform at a high level in a dominant social/cultural environment, while at the same time spending energy to counteract racial stereotypes and to sift between what is or isn’t a racial “put-down” or insult. As one “bridge leader” explained the dilemma: “A black person, I think, is constantly compelled to raise up this filter, ‘Is this other person’s behavior in my direction a product of his humanity? Is he just an ugly, evil SOB? Or, is he a white person who generally speaking is a nice guy, but he’s got this attitude because I’m black?’” While this understanding provides little relief to black individuals who are faced with such choices on a daily basis, it helps raise the con-

sciousness of non-blacks about how fortunate they are. It promotes among non-blacks the openness to learn through deeper dialogue with blacks and other minorities who continue to face discrimination at MIT and in this society.

The “bridge leader” group is not only small, it is made up largely of senior faculty members and administrators who are either retired or nearing retirement. The question is, Who (if anyone) will take their place? The generational gap here is cause for concern. The “bridge leaders” grew up during the Depression, World War II, and the civil rights movement—periods in our history when, for some, social consciousness and commitment evolved into central issues. Those who grew up at a later time—since the 1970s, part of the so-called “me generation”—find that issues like community diversity and commitment to minority opportunity are of a lower priority. Also, there is a growing division between underrepresented minorities and non-minority women/gay groups’ efforts to obtain equality at MIT, which needs to be

The Institute celebrates black history, 1975.

addressed by both groups if these are to succeed. Nevertheless, one of our challenges as we enter the next millennium is to develop a new generation of “bridge leaders” who will understand, adapt, and implement the values of their predecessors.

ADVICE BORN OF EXPERIENCE

This brings me to the advice that interviewees considered most important to convey about ways to enhance the role and experience of blacks at MIT. The suggestions listed below are arranged by topic and by the groups—administration, students, faculty and administrators—to whom the advice is directed. Abbreviations denote the source of advice: *S* = students, *BF* = black faculty, *BA* = black administrators, *NBFA* = non-black faculty and administrators. A few quotes are included, as well as illustrations from selected interviews. Other suggestions, not listed here, emerge throughout the interviews, as readers will observe in the transcripts.

ADVICE TO ADMINISTRATION

Recruitment/Diversity

- Encourage dialogue on diversity issues among blacks and non-blacks. Provide a better opportunity for students to understand issues centered around race and to get involved in community activities as preparation for leadership roles. “I found, and it really got reinforced when I got to MIT, that any idea I had got improved on when other people got involved in it. I found early on that when people take an idea and look at it from their set of experiences, they can see ways to make the idea better, or they can see potential ways in which the idea might be misinterpreted. So you’ve got to talk with other people. It requires a lot of time. On the other hand, you end up with a better product. First of all, people have helped to develop it, so they have ownership in the end product.... Now, it doesn’t work if you just have groups and then you go off and do what you had in mind all along.” (Shirley McBay) (*BA*)
- Increase personnel committed to minority participation and integration at all levels, including more minorities in administrative positions. Hiring more people of color would show diversity at work and increase the effectiveness of the sup-

port system for minorities on campus. Greater racial diversity would help establish a “comfort zone” for all, as well as build a more effective relationship among staff members. Supporters of diversity should make themselves known. “We need a real affirmative action officer reporting directly to the president and not to the vice president for human resources, and let that person decide what kind of staff they need—if this Institute is serious about affirmative action. And then they’re going to have to kick butt with the faculty, because that’s where the biggest problem lies.” (Yvonne Gittens) (*BA*)

- Continue to build a racially and culturally diverse student base and commit resources to educating the different groups, especially whites, about the value of diversity—“The pedestal needs to go away and we need to understand that we are all just sitting right here together.” (Nelson Armstrong) (*BA*)
- Build self-confidence in black and other under-represented minority students, because “society in general is telling them in subtle ways ... that they are not going to be successful. We have to do all that we can to counter such messages.” (Jerome Friedman) (*NBFA*)
- Motivate heads of academic departments to place minority and women faculty recruitment on the top of their agendas; senior faculty should be rewarded for successful efforts in this regard. Develop better strategies to address the lack of black faculty members: “So, the pools are small.... But it really requires specially focused efforts to increase the number of faculty members, to recruit talented black faculty.... So it’s hard and, although I think we have a reasonable record, we certainly don’t have as outstanding a record as we could if we really put enough muscle behind it in our efforts.” (Michael Feld) (*NBFA*) “MIT tried to seek diversity in the student population and I felt that that was good; I don’t think it really achieved that kind of diversity in the faculty. I don’t think MIT is alone in this regard. I think most major universities have not had the success in the faculty ranks that they have had in the student population. I think if you look at American higher education, it is still a rather segregated enterprise, much different than other professions—medical profession, industry, government. I think academia is very,

very segregated.... I think it goes back to what I was saying about how it's very difficult to isolate race as a factor in faculty development. I feel that a career in academia is so amorphous that one can usually attribute success or failure to almost anything. As a result, it's very difficult to pinpoint when racial factors may be operative. A lot of times I think that they are operative, but people can't get at them. As a result, you find a number of minorities not being brought into the community in an explicit way. You see this in the small number of Ph.D's that are given to minorities. They aren't being encouraged at an early stage. Then, even beyond that, after they get their Ph.D's, a lot of them aren't brought in and promoted. They find industry and other professions much more attractive because they don't want to deal with the promotion and tenure case situations. These are very loose processes that are subject to many whims." (Kenneth Manning) (BF) "[There is] the difficulty of getting these departments—and I start with my own, time after time after time—to appreciate the quality and relevance and significance of black scholarship. It is just an overwhelming problem. Some people may really have a racist bias. They will be surprised themselves, probably, but the

blindness are just there. It's not 'their group.'... In the end, the institution goes on essentially being the same, despite all the meetings on diversity and affirmative action." (Willard Johnson) (BF)

- Examine reasons why many untenured faculty members have a negative experience at MIT, and why the situation is worse for black and other underrepresented minority faculty—"The reason black faculty feel so bad and so alienated most times is because white faculty feel bad and alienated. It's just like Jesse Jackson said, 'When white folks get a cold, black folks get pneumonia.' If you talk to a lot of white faculty, you find that they don't think the administration is treating them right either.... What they have done is introduce an academic version of social Darwinism, in which you let everybody fight it out and the strongest survive." (Monroe Little) (BF)
- Assist nations of color in Africa and elsewhere, the "technology-poor" of the world, to acquire opportunities for access to the latest technologies. (Kofi Annan) (S) Encourage exposure to other parts of the world and other parts of the country; develop dialogue with people from various countries, cultures, and races to highlight that "there is

"Bridge leader" Leon Trilling with a student. Photo: Sheldon Lowenthal

a common humanity and we all are just human beings ... [and] there is no particular group of people that has a monopoly on abilities.” (Jerome Friedman) (*NBFA*)

- Help minority students to establish relationships with faculty members outside and inside the classroom, and appreciate more the human side of their educational experiences at MIT—“I think my guideline is to be as approachable as possible, as open and available as possible, and to be supportive but not directive. If there is anything administrative that I can do, if there is information that I can give about opportunities at other places, of course I would do that. I think I have never treated minority students or foreign students in any other way than I speak to the other students. I hope they get that sense. I know some have, from interactions with them.” (Leon Trilling) (*NBFA*)
- Improve the quality of campus life beyond the academic, in order to promote well-roundedness: “What I would think about is that you look for opportunity, the opportunity to make a difference in somebody else’s life, to make a difference in the community that you live in.” (Melvin King) (*BF*)

Programs

- Make financial aid packages more attractive, so that black students have an incentive to choose MIT over other alternatives. Increase financial support for student groups such as the Black Students Union (BSU) and National Society of Black Engineers (NSBE). (*S*)
- Retain and promote “Chocolate City” and other all-black living groups that play a significant role in the survival of a number of black students at MIT—“having a place to call home and feel more comfortable in” helped energize and motivate students in a potentially alienating non-black environment. (A small minority of black students felt otherwise, that “Chocolate City” further alienates by separating black students from MIT’s social mainstream). (*S*)
- Expand programs such as Minority Introduction to Engineering and Science (MITES) and Project Interphase. Expose more freshmen to programs and resources that will help get them through the first year. Make Project Interphase even more academically rigorous, especially in the area of study and time-manage-

ment skills. Work to eliminate the stigma that such programs are intended only for minorities with deficiencies in ability and preparation. “I attended Interphase, so I think Interphase had a lot to do with it—the bonding of the class of students. Those students I bonded with in Interphase were basically my support network going through MIT....” (Darian Hendricks) (*S*)

Mentoring

- Promote mentoring—“If you can’t do it for a lot of people, then take one or two under your wing and be responsible for helping to guide their careers and helping them to develop themselves.” (Isaac Colbert) (*BA*) Encourage dialogue that helps individuals gain “strength to get through some of the tough times.” (Anthony Davis) (*BA*)

ADVICE TO STUDENTS

Preparation/Confidence/Reality

- Be confident, but avoid over-confidence—“suppress the all-knowing spirit.” Don’t become intimidated or overwhelmed. Develop a profile of the successful alumnus/alumna; assess whether your own personality, intellectual drive, and professional goals are suited to MIT. (*S*) “The thing I go to again and again is that you have to strive to be fearless.... Once you have that personal inner sense of comfort or peace, then you can learn anything, you can be anything, you’ll have the drive it takes to set a goal and to reach it. A lot of that comes through understanding God, the power of God in your life, that there is a power that is bigger than all of us and stronger than all of us that can help all of us.” (John Wilson) (*BA*)
- Do not use racism as an excuse not to succeed—“Performing well is the best defense and the best response to the way people are going to see you and treat you. It’s not fair because not everybody can manage that. And I don’t think that majority students have to manage that to survive, but black students almost always do and, if they’re on edge, then all of the weight of the prejudice will fall against them.” (Lynne Richardson) (*S*)
- Don’t be afraid to ask for help—difficult advice for black students to accept, since they carry a burden that non-black students don’t to the same extent, that is, of feeling they need to prove they

belong: “[I]f you decide to be ‘Rambo’ and do everything by yourself, that’s a prescription for failure and mental breakdown.” (William Watkins ’81) (S); “[T]here is a great deal of help here at MIT—help of all kinds, academic and psychiatric. But they can’t force it on you. If you don’t ask for it, it will do you no good.” (Victor Ransom) (S)

- Never give up—find a way to get through, no matter how difficult it might be: “You bring the average entrepreneur in here, and for every time he failed, I have failed twice. For every pain that he felt, I done felt fifty. I just never gave up. When I set out to do something, I will not give up until it’s done.” (James Hubbard) (S, BF) “First and foremost, read. Read as much as you can. ... Read about who you are. ... I think that’s important because it gives you some foundation to understand how you got here. Without that reading, I have great fear that you get caught by the trappings that are in front of you..” (Nelson Armstrong) (BA)

- Select a career just as you would make other personal choices in life, following what feels right to you. (NBF4) Go after work that fully appeals to you: “I had to make a decision, whether my parents or anybody liked it or not, that this is what I felt good about, what I felt I could make a contribution doing what I felt passionately about.” (Hubert Jones) (BF) “I would say to basically follow your ‘druthers,’ follow what you would rather do at any particular time, but realize that it’s going to change. A lot of people ... come in as a freshman and say, ‘I’m going to be this,’ and then they feel an obligation to stick to it, even though their interests change as they get exposure to this and that. I’m saying, go with those changes—whatever you’re interested in at the moment, do that. What you will end up doing may not be what you had planned, but it’s what you should do. I think everyone has a purpose in life and there’s no way for us to know that in the beginning, or even at the end sometimes.” (W. Ahmad Salih) (S)

Chess players, March 1973. Photo: Roger Goldstein

- The positive effect of the MIT experience, despite the pain, has tremendous career benefits: “Having the MIT credentials gave me an element of credence and credibility.” (Lucius Gregg, SM ’61) (S) “I would say that the best thing about my experience at MIT was that it opened up such a wealth of knowledge to me that I will forever be grateful.” (Bennie Ward ’70) (S)

Networking

- Don’t isolate yourself—take advantage of the opportunity “to know people who are excellent in whatever it is they do, who are the power movers and shakers in their given fields,” a few of whom will be minorities and the majority of whom will be whites. (James Williams) (S, BF) Understand that the key to success at MIT is persistence and perseverance, as much as talent and preparation—“Nothing in the world can take the place of persistence. Talent will not, nothing is more common than unsuccessful men with talent. Genius will not, unrecorded genius is almost a proverb. Education will not, the world is full of educated derelicts. Persistence and determination alone are omnipotent.” (James Hubbard, quoting President Calvin Coolidge) (S, BF)

- Find a support group: “Again, there is such a strong support structure at MIT. Sometimes it’s undervalued by students.... I also benefited from some of the associations like Black ME, BSU, and NSBE, and Chocolate City living group.” (Gerald Baron) (S) “[Students] have to find a group that they can work with, because the basic way the structure is designed is for you to get through it with a group of people.... They have to realize that accepting help is not stupid, it’s smart.” (Lisa Egbonu-Davis) (S) Listen to upperclassmen, especially those who have found a way to succeed at the Institute; reach out for help from TA’s and faculty; get involved with non-academic activities, and don’t ignore personal needs. (S)

- Don’t confine yourself to a single community; reach out and experience the rich diversity of students at MIT: “This is probably the only time in your life, unless you stay as a faculty member, when you’re ever going to be in a community of people this smart—all this smart—and you might as well take it for all it’s worth. If there’s a chance for you to do something and you don’t go for the brass ring, you’re making a mistake—whether it’s,

‘God, I’d always like to have learned to fence, or learned to sail, or learned to do this or learned to do that,’ or ‘I’ve always admired this guy—he helped train the astronauts and I’d love to meet him.’ The answer is, if you don’t go up and stick your paw in his or go out of your way to meet him, he’s not going to know you’re going to want to meet him.” (William Hecht) (NBFA)

- Make connections for spiritual, professional, and practical support and guidance; plan out academic and career plans, but be open to advice from others; build relationships that help you become more effective in the MIT environment; find out who the “stakeholders” are and who is genuinely interested in you. (BA)

ADVICE TO BLACK FACULTY AND PROFESSIONALS

Preparation/Confidence/Reality

- Think carefully before investing time and effort in becoming a professor in a particular field; the role of faculty member requires a passionate level of engagement: “[D]o not let other people define what you are going to do. You have to make that definition yourself. Don’t always be looking to the traditional academic patterns for approval. In other words, if you’re considering a course or a project or something like that, it does not matter whether it’s been done before or not: If you are convinced it’s worthwhile, go ahead and do it. It can be improved but it has to be started, and that’s the important thing. It’s better to work with things that have not been fully exploited than to say, ‘Well, I know this is done at Stanford or MIT or wherever, so it’s all right.’ No, we will set the tone of what we do and just go on from there.” (Joseph Applegate) (BF) “If you’re not interested in it, then don’t bother. That would go for anything—law, medicine—prestige, money, the lure of all those things in the end don’t get you there.” (Melissa Nobles) (BF)

- Be self-confident and determined: “For young black women, one of the first lessons I think that’s important is to believe in yourself. If you don’t believe in yourself, they’ve won as well. But in addition to that belief, one must truly love oneself and respect oneself. If you truly love yourself, then it’s very easy for others to love you. You never have

to quest or seek love. If you truly respect yourself, it prevents you from getting into situations that compromise you. If you believe in yourself, it allows whatever intellect that you have to flourish. You don't doubt yourself and you don't hesitate to take actions on things that you need to take actions on. But the other thing is to be honest with oneself. The honesty prevents you from making a fool of yourself, from rejecting reality, from denying reality, and from overlooking things that are often very harmful to yourself." (Jennie Patrick, Ph.D. '79) (*S*)

- Do a reality check and recognize degrees of tolerance and intolerance, acceptance and non-acceptance; avoid making the "mistake of thinking [you] are welcomed or should be welcomed, when [you] are merely tolerated." (Chester Pierce) (*BF*)
- Seek opportunities to make a difference in somebody else's life in the community where you live, apart from self-interest and concern about financial security. (Melvin King) (*BF*)
- Understand that the key to success at MIT is superb performance in research, and to a lesser degree in teaching and in gaining one or more senior faculty mentors. Black and underrepresented minority faculty often must be better than the norm and able to navigate their way through the academic minefield twice as carefully as their non-black colleagues. "I think the main important thing is performance. They have to fight what the Jews used to. You had to be twice as good as any WASP around in order to make your way." (Herman Feshbach) (*NBFA*) "Bernie [Bernard Frieden] was my advisor, from the first day through the Ph.D., and he always gave me suggestions about how to take the next step. He always asked in advance about how I was dealing with choice, about making sure I knew about choices and offering to advise me on making those choices. On a number of occasions he provided support, both in ways that I know and in ways I'll probably never know. Later I would get support as a junior faculty. Someone would call me up and I'd say, 'How do they know me?' Because somebody had to tell them!" (Phillip Clay, Ph.D. '75) (*BF*)
- Be prepared to deal with isolation: Know your surroundings and be aware of your environment, especially its weaknesses—"The 'system' is unfair

and you need to understand that from the beginning." (Sylvester James Gates) (*S, BF*)

Networking

- Meet the right people: "[A]cademia is not really very different from a country club.... [Y]ou get in if enough of the members want you in." (Sylvester James Gates) (*S, BF*) Build connections inside and outside MIT. Never take interactions with colleagues lightly and always reach for the mainstream, if you want to be integral to the institution: "But seriously speaking, my advice would be to find a mentor. That would be the most important thing. Having help getting through the system is incredibly important, and having someone who can give you guidance and act as your advocate and also give you advice about what you're doing wrong—very frank advice—is very important in a system such as ours. In some sense, it's not a naturally nurturing system at any level, and I would say that having a mentor is very important." (Michael Feld) (*NBFA*)
- Don't "burn bridges": "I spend a lot of time telling my kids, 'Don't burn that bridge. If you've got to leave [a job], leave.... But don't go out killing everybody in the process, because ten years from now you may be working with this guy.'" (Hubert Jones) (*BF*)

Mentoring

- Find a mentor—"somebody in your field who can critically evaluate your work, whom you trust to give you feedback about it and help you strategize along the way." (Evelynn Hammonds, SM '80) (*S, BF*) "If there's anything that has been a commitment for me, it's that I always wanted to be in a position to share with others who were as ignorant and blind as I was about educational opportunities. I wanted to be in a position to give them insight into how to negotiate the system. Fundamentally, it's a game. If you know what the rules are and you have a few cards to play, you can play. If you don't know what the rules are and you don't have any cards, you can't play. It's basically that simple." (Margaret Tyler) (*BA*) The mentor does not necessarily have to be black, but someone whose experience and style you admire and from whom you feel you can learn. (*BA*) "[Y]ou must have a mentor. I don't think MIT will yield to an individual, no matter how good or how strong that

foundation is, without a mentor to help navigate through these icebergs waiting to knock a hole in your ship and sink you, man. They're cold, man, and monstrous underneath. You need a mentor at MIT. I don't think it's going to work without it.... And then I think you need some good luck, some good fortune. Somehow my presence at MIT coincides with Woodrow Whitlow, with Jim Hubbard, with Patrick Hanley, with Karen Scott, with you, with Jim Young. And all of that, when combined together, produced whatever it is that I've been lucky enough to work with and been a part of. So that's important. Some of the stuff, you just have to be in the right place at the right time, meeting the right people. And hopefully it's not all one way, namely that Wes Harris took away and didn't give anything, but all of the people—not just Leon Trilling, but you and Jim Young and Jim Williams, the whole nine yards to all. So many of the people who have come and gone I can't remember them all—Willard Johnson, Shirley McBay, John Turner.” (Wesley Harris) (*BF*)

SUMMARY

One opinion that recurs throughout the oral history interviews is that MIT's efforts over the years to increase the black presence on campus have been a success, particularly in one area—admission of black and other underrepresented minority undergraduate students. In fact, MIT served as a pioneer in the late 1960s and early 1970s, devel-

MIT alumnus and faculty member in aeronautics and astronautics John-Paul Clarke (SB '91, SM '92, ScD '97), with his wife and fellow MIT graduate Michelle Wilson-Clarke, July 2000.

oping admissions criteria so that black students would get an opportunity to attend this institution. Some black students needed additional preparation, especially in mathematics, physics, and chemistry, before entering the first year, and a summer program—Project Epsilon, evolving into Project Interphase—was developed to meet that need. Among schools of engineering and science, MIT's criteria became a model for other institutions to increase the numbers of young minority scientists and engineers. The Office of Minority Education (OME) emerged in the mid-1970s to further enhance the performance of minority undergraduate students.

These programs, combined with efforts by the Admissions Office, enabled the Institute to develop criteria to select black and other minority students. Initially, risk was assumed reluctantly. There was some weakness in selecting students. Yet there was also a quick learning curve, and it was not long before the errors dwindled to proportions much like those for the student body at large. The Institute learned through careful study and tracking of minority students. Within a few years, the graduation rate of minority students rose markedly. The Institute stayed the course, especially in the late 1960s and 1970s under the leadership of Howard Johnson, Jerome Wiesner, and Paul Gray (the latter perhaps the mainstay on the administrative front-line during the 1970s), and with courageous advocacy by black students such as Shirley Jackson, James Turner, and Linda Sharpe, to name just a few. The beneficiaries of these three decades of effort were the substantial number of black, Hispanic, and other underrepresented minority students who have come through the Institute since that time.

The question is sometimes asked, “Did we do right earlier or even now by bringing these students to our campus?” The answer is a resounding yes, taking all the evidence into account—the documentary record, my interviews with black alumni/ae, the results of a black alumni/ae survey, and my own observations as a minority administrator and faculty member over the years. The Institute deserves credit for this success. It should also, however, develop strategies to connect with black and other underrepresented minority students who come with above-average abilities, but who for some reason fail to succeed at MIT. Yet there is no question that, through a series of bold

actions, MIT has had an impact in developing a number of successful minority undergraduate and graduate degree holders in science and engineering fields. The record does not match that of historically black institutions of higher education, but it ranks at or near the top of predominantly white institutions.

On the other hand, MIT has made few gains in the area of black faculty. The reason often cited is the so-called “minority pipeline deficit,” a lack of graduate students with sufficient background, training, and potential to become faculty members at a premiere science and engineering institution such as MIT. But this rationale is open to question. Although we are still nowhere near where we should be in terms of the pipeline, the last three decades have seen an increase not only in numbers earning advanced degrees but also in those moving on to impressive careers in higher education, business, industry, government, and elsewhere. Examples cited earlier, James Gates (University of Maryland) and James Hubbard (Boston University), demonstrate black junior faculty moving on from junior appointments at MIT into positions of influence and recognition at other academic institutions. The trouble is, MIT does not usually keep them here. As a result, we have lost not only the opportunity to diversify the faculty with more minority scientists and scholars, but also the opportunity to provide minority role models who can encourage the brightest among our minority students—many of whom end up in industry or business—to consider and thrive in careers in the academic world.

What explains the relative lack of black senior faculty at MIT and the unwillingness to recruit and retain substantial numbers? I believe there are a number of reasons, cultural and psychological, that lie deeper—and are therefore more difficult to undertake—than easy explanations about the pipeline deficit.

First, the rhetoric of liberalism has not translated into a consistent program of liberal action. By the late 1960s, the MIT leadership had concluded that the issue of the near invisibility of black faculty at MIT should be addressed. MIT then went on to become one of the first institutions, if not the first, to develop a solid affirmative action plan under which each unit or department would demonstrate and document good-faith efforts to increase black and other underrepresented person-

nel. The Institute earned national attention for this plan, which was recognized by the federal government as a model for other institutions.

Yet although considerable effort and resources were expended to maintain and modify the plan over the years, what came of it was little more than the image of MIT as a “do-gooder” on paper. Black faculty and administrators, myself included, made little headway in persuading our non-black colleagues to translate words into action. The process allowed senior non-black faculty departments heads and others—the gatekeepers of the Institute—to look good without necessarily “doing good.” It was relatively easy, it turned out, to gain recognition as a supporter of affirmative action—at least enough to be left alone—by voicing the right positions and at the same time making little practical effort for change. People would talk about increasing the number of black faculty at meetings and then return to their laboratories, research areas, and offices to focus on their top priority—academic pursuits—while forgetting about the racial issues that they had just discussed. The result was an appearance of concern unmatched by follow-up in action.

Also, there is a level of ongoing distrust and suspicion about blacks as potential intellectual leaders in science and engineering fields. Old ideologies linger, with blacks perceived as deficient in

Steven Isabelle (PhD '95), surrounded by fellow MIT alumni at a reception following his marriage to Gillian Brown, in Kingston, Jamaica, July 2000.

quantitative and analytical skills (an idea reiterated recently in *The Bell Curve* and other studies). While such views are not often articulated openly at MIT—possibly out of fear of reprisal, possibly because such views clash with liberal political orthodoxy—they come out in subtle and not-so-subtle ways, as when a non-black professor expresses amazement when a black undergraduate earns top marks in his mathematics class, or when a black graduate student finds herself on the outer edges of a lab’s research program, or when one realizes that a large portion of the few black faculty members at MIT over the years have been in fields such as music, history, political science, business, and urban studies and planning, rather than in scientific disciplines that are more central to MIT’s mission. Also, non-black faculty worry about the risks inherent in having a black as an integral part of their program—how will the person interact and fit in socially as well as professionally, and will he or she (even if brilliant) be perceived by col-

leagues, potential donors, and others as “an affirmative action case”? In their view, the risks of bringing a black colleague into the fold too often outweigh the benefits.

Paul Gray cites an interesting case from the late 1960s when, in response to the administration’s effort to recruit black faculty members, one head of a major department asked at a meeting whether it would count if he “put on blackface.” An embarrassed silence descended over the room, which Paul attributes to shame, amusement, or anger at the department head. But it is just as likely that the silence reflected surprise that this department head could get up the nerve to say in public what a number of people were thinking then—and what many are thinking now, three decades later: that MIT should not be a place to conduct experiments in social engineering. Actions speak louder than either words or silences, and the fact is that the goal laid out by the administration thirty years ago—to recruit thirty black faculty within

Martin Luther King, Jr. observance, MIT, 13 January 1978—pictured (left to right) are Jerome Wiesner, MIT president; keynote speaker Jerome Holland, distinguished educator, diplomat, and MIT Corporation member; Clarence Williams, special assistant to the president and chancellor for minority affairs; Paul Gray, chancellor; and Walter Rosenblith, provost. Photo: Calvin Campbell

two years, at least one per department—has not to this day been accomplished. This failure, I believe, has less to do with the often cited pipeline problem than with cultural and racial attitudes that die hard.

Excellent opportunities exist to increase the number of black and other underrepresented faculty at highly selective institutions, such as MIT, which attract the best faculty and students from around the country and the world. Unfortunately, these opportunities have not always been effectively utilized. One resource that should have been used more often, and that remains a viable option, is the grooming of our own highly screened minority graduates for faculty posts. At one point, close to fifty percent of the MIT faculty had obtained at least one degree here, so there is ample precedent for recruitment within the ranks. Like other selective institutions, however, MIT has never retained a reasonable share of its outstanding minority graduates, the vast majority of whom go on instead to careers in technology, business, and other professions. More graduates should be recruited into faculty positions here. To make this

shift, so vital for the future of our minority communities and the nation at large, institutions like MIT must develop in at least four fundamental areas.

First and most important is an influential, uncompromisingly committed leadership, provided by academic officers—not only the president but vice presidents, provost, and department heads as well—who believe in the principles and value of recruiting and retaining minorities. Just as business, government, and other agencies have recognized the inclusion of minorities as essential in their own environments, so too must academic leaders come to this realization, and act on it. Second, strategies must be devised to identify promising minority undergraduates and to motivate them to undertake graduate study with a view to entering the faculty ranks. Third, special efforts must be made to nurture promising doctoral candidates as potential faculty members. By failing to do this, we will give away our best products to industry and the professions. Potential minority faculty members should be identified by the end of their second year of graduate school;

Clarence G. Williams with MIT alumni, July 2000.

ample guideposts are already in place for assessing exceptional students. Finally, consistent and wise mentoring of these talented young minority scholars, by senior faculty members, is essential to any program that aims to make a vital difference in the recruitment, retention, and ultimate success and productivity of minority faculty. I hope that two committees appointed in September 2000—the MIT Council on Faculty Diversity and the Task Force on Minority Student Achievement—will consider these and other ideas as they devise new strategies and propose effective plans of action.

This, I believe, is the biggest challenge facing MIT as we enter the new millennium: how to transform attitudes to the point where blacks and other underrepresented minorities can be accepted alongside whites as leaders and equal partners in the Institute's core mission—education and research in science and engineering. Dialogue still has an important role to play. Some say we have talked ourselves almost to death on this subject and gotten nowhere, and that the time for talk has come and gone. My response to that is, yes, we have talked a lot, but we have often talked *past* each other rather than *with* each other. Now is the time to move our dialogue on race a notch higher, getting more non-black faculty members involved—not just the “bridge leaders”—and working toward a clearer understanding of racial diversity issues, a consensus on goals, a plan of action, and a strategy for immediate implementation. I believe that our community will be the poorer if we do not seize the opportunity.

ORAL HISTORIES

VICTOR L. RANSOM

b. 1924, SB 1948 (electrical engineering) MIT, MS 1952 (electrical engineering) Case Institute of Technology; graduate study in mathematics and statistics, New York University, 1956-1959; joined Bell Laboratories in 1953 as member of technical staff (MTS); supervisor, 1965-1975; department head, Operator Services Department, 1975-1982, and Switching Systems Studies, 1983-1984; division manager, Network Switching Technology, Bellcore, 1984-1988; owner, Systems for Special Needs, 1988- ; adjunct faculty, Newark College of Engineering and New Jersey Institute of Technology; president, Telephone Pioneers of America Council, Bellcore and Bell Laboratories; holder of two US patents.

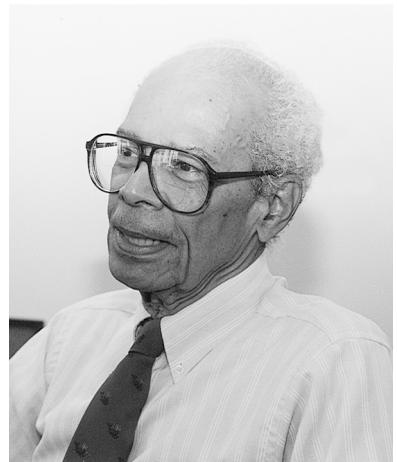

Based on your letter asking about things that might be of interest to the archives that you're generating, I gathered up for you several articles that I had written for Bell Laboratories publications. Bell produced two periodicals, one was the *BSTJ*, a technical journal, and the other was the *Record*, which was directed more to a popular technical audience. Among the material that I have brought is a copy of the *Record* in which my picture was used on the cover. In the issue, I was writing about the system I had worked on. It was a system that at the time was considered to be "new art" and so was of considerable general interest to people in the company. The transistor had recently been invented at the Lab and the management was making a big effort to use transistors in all their systems. Ours was a system built around transistors and digital products.

In the late '60s, an effort was made by the company to show blacks in their various roles in the laboratory. One of the pictures which I have given you was used repeatedly. In fact, it was used in the annual report for AT&T and was also placed on the wall at 195 Broadway, AT&T headquarters. I used to amuse myself, since I went there often for meetings, by checking to see if the picture was still on the wall. I said, "Well, if it's still there, I must still have a job. As soon as they take it down, I know they're going to get rid of me." As I said, the picture appeared in a number of places. The copy that came up when I reached for materials was a booklet that talked about educational opportunities at Bell Laboratories. In it, there is a full-page picture of me. I'm explaining

how a piece of measuring equipment that we use would function.

Among the articles I have given you also is the most recent that I've written, which was published in an encyclopedia. About the time I retired, I became interested, as a result of volunteer work with the Telephone Pioneers, in technology for people who have various types of disabilities. In fact, in the last year, when I knew I would be retiring, I gave up my management job and began working on applications that might be of interest to the operating companies on the use of technology for people who are disabled. I used that as an opportunity to teach myself a lot about what was happening in that field. A friend of mine who was writing this encyclopedia on telecommunications asked if I could produce an article that he might use in this general area. I wrote this article entitled

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with Victor L. Ransom in New York City, 24 July 1996.

“Communication Aids for People with Special Needs,” for the encyclopedia. The piece with written with an associate of mine who had been working with me in this area, Laura Redmann. The paper surveys applications of computers to communication for people who are disabled in one way or another. I’ve been involved in that field since I’ve been retired. I also teach a course at New Jersey Institute of Technology (NJIT) on the application of computers to people who are disabled.

There’s a story that goes along with that. The shorter version of it is that the program was started more or less as a pilot program at NJIT to teach students in the technician area about “rehabilitation engineering.” The government funded it in such a way that it was popular. I believe it paid tuition and bought books for students in the program. I was brought into the program to develop and teach this course on computer applications. I taught once under the program. Sadly, there was an implosion in the number of students who entered the program and funding for the program ended. I went on to teach other courses and we are now offering the course again this fall to see if there’s enough remaining interest.

The field of rehabilitation technology has been a source of continuing interest for me. Besides the training program I just mentioned, the federal government also developed a program to make people more aware of assistive technology. The term “assistive” is generally used instead of “rehabilitation.” The name applies to a whole range of technology, from wheelchairs to aids for persons who are visually impaired to types of specially adapted environmental controls. Under the federal government program, on the order of five hundred million dollars over five years was allocated to the states to come up with programs to increase public awareness of assistive technology and to help people obtain the technology.

I was active with a group to try to bring the program to New Jersey. We have had the program now for a number of years. It’s called TARP (Technology Assisted Resource Program). I am on the State Council for the program. What they try to do is to provide resource centers where people who have the need for equipment can come see it and try it out, and also to work across a broad range of problems that people have with getting and using equipment. Usually, the major problem is that people who need the technology can’t get

funded. Medicaid has never heard of the equipment or doesn’t think they can fund it. So TARP works with a group of legal people to help to resolve these kinds of problems, and I’m still active in that effort.

I think I explained how I got involved in this work. It was when I was with Bell Laboratories, toward the end of that career—or was it the middle somewhere? I know at the time I was a department head. The management at that time very actively supported a community service group called the Telephone Pioneers, a volunteer group that existed throughout the Bell system. We were encouraged in the management to play a leadership role. Your boss might say, “It would be nice if you would run for vice president or president in our location’s Pioneers Council.”

I came into the Pioneers in that way. I was intrigued by the fact that one of the more interesting things that Pioneers at Bell Labs did was to develop communication aids. I was always surprised, though, that there wasn’t a greater involvement within the Lab in that aspect of the Pioneers’ work. I particularly wanted to become involved in that aspect of their work because it tied into my engineering, and I was anxious to do something that would help people who are disabled. This interest came about in large part because my son has schizophrenia. That’s a mental illness that’s not well understood. The people who work in that area are largely psychiatrists and psychologists, and I’m not that. But the encounter with a disability increases your sensitivity to the special needs of people with disabilities, and I thought this was an area in which I could be relevant.

So I began working in this area with other volunteers at Bell Laboratories, and later at Bellcore, when I was transferred there. One thing I noticed as I worked with this group was that we had a “not-invented-here” approach. That was characteristic of the Laboratories people at that time. If it wasn’t in the Bell Systems, then it didn’t exist. So when we were told about someone who had a particular need, we went out and designed and built our own equipment. But over time I became aware of the fact there was a very substantial field already existing of people building equipment. A lot of them would be businesses that would start and then fail because there wasn’t a general awareness of the availability of this technology. So when I knew I would be retiring, I

thought, “That’s a fun area to work in and I ought to learn more about the field.”

That’s when I took off the year and, among other things, I joined the RESNA—which used to stand for the Rehabilitation Engineering Society of North America, but the group no longer appeals only to engineers but to a broad range of persons working in the field. In addition to joining this group and attending their conferences and workshops, I took a course—at the TRACE Center at the University of Wisconsin—concerned with the application of computers and controls for disabled persons. I then changed my job at Bellcore to work on identifying an area that Bell operating companies could change to offer better service to disabled persons.

After I retired, I formed a small company called Systems for Special Needs. Under the company name, I have designed environmental control equipment which is used to a limited degree at one of the hospitals in New York. I still remain in touch with the hospital’s staff and continue to do some occasional design work for them. The company has provided me, along with my teaching, with a considerable source of satisfaction and entertainment. I have found that it is more useful to deal as a company rather than an individual, so the company still exists even though my profits are small. I pay my occasional taxes and make occasional earnings.

In the company and teaching, my other effort in the assistive technology field is a bit of voluntary work with a resource center in my community, the Tech Connection, whose principal focus is providing opportunities for disabled persons and their families to learn and use various types of assistive technology. So that’s largely where I have been since I retired.

One of the things that I think would be very helpful is to talk a little bit about your family and your early pre-college experience. Some of the highlights of that period I think would be good.

I was born in New York City. My mother was a teacher in the New York City school system. She was an intellectual and aware of what was going on in the world. My father was primarily a writer. He wrote in newspapers and at one time became a photographer. He went to Fordham College and Fordham Law School and completed both programs, earning an LL.B. degree, but he never prac-

ticed law. It was a very difficult time in the early years of the Depression, but because my mother was a teacher we were moderately comfortable. She went to Howard University and knew all the people down there. Her family, the Flagg family, came from Washington, DC. Her sister was one of the founders of AKA, the Alpha Kappa Alpha sorority at Howard. My parents were part of an interesting and wide-awake group called the Harlem Renaissance.

I don’t think that I did terribly well in elementary school. I just remember it as a grim, uninteresting experience, with my mother desperately trying to teach me to spell. But toward the end of junior high school, I began to be a little more scholarly and became interested in school. As a result of my mother’s drawing it to my attention, I took the examination to go to Stuyvesant High School, a special school in New York City emphasizing science. I passed the examination.

Attending Stuyvesant was an exciting and interesting experience. I lived at home and commuted. At the time I applied, I was living in New York City. We had the unusual experience of moving from Brooklyn to New York repeatedly during that period. I like to kid about the fact that my mother moved sixteen times before I was sixteen years old. If she thought the schools were better in another community that was “opening up” to blacks, or if the landlord complained about anything we kids did, we would move! I don’t remember it as being a particularly unpleasant experience. We often moved back and forth between communities that we knew.

We lived in Washington Heights. Last night, my wife said, “Why don’t you say Harlem?” We were very much aware of the fact that Washington Heights was not part of Harlem, but I guess today it’s considered Harlem. At any rate, we lived in the same house several times and even in the same apartment. I moved so much that going to a high school outside our neighborhood didn’t seem to be unreasonable. I had to commute to Stuyvesant, on the subway from Manhattan or Brooklyn. All the moving meant that I wasn’t really as involved in the social life of the community. This is something I missed.

During the Depression years, one of the significant factors that influenced me greatly was my summers at Camp Atwater, a black camp in East Brookfield, Massachusetts. I attended for about ten

years. I recall with considerable affection a nature study program conducted by Frank Johnson, who later became a pathologist. I never saw him after the camp experience, but he greatly influenced me toward a career in science. He was very much the “SCIENTIST” for me. I was uncertain as to what area of science I was interested in. In fact, when I had to choose a high school, my uncertainty was a factor in selecting Stuyvesant over Brooklyn Tech. I wasn’t sure what I wanted, science or engineering. Brooklyn Technical High School sounded too much like engineering, and since I had never met an engineer nor read what they did exactly, I had no role model.

I think my decision to apply to MIT was as a result of my mother’s awareness. She was an active member of the Teacher’s Union in New York City. By the end of high school, I was fairly sure I wanted engineering, and MIT offered science and engineering. I wasn’t particularly conscious of the very high tuition. My parents always acted as though college was just something you did! I remember having an interview with someone who was part of the Educational Council Program, at one of the offices downtown. The interviewer asked me, “How will you handle tuition?” I had no idea. I just assumed my mother would pay. He later asked my mother and she simply said, “We will pay.” I didn’t get scholarship aid at that time. In fact, I was not initially admitted, but was placed on the waiting list and then subsequently admitted. I had done quite well in high school, but Stuyvesant had some brilliant students and several had applied to MIT.

At any rate, I got in. I don’t recall a great deal about it, but there are a few things I do remember. One of them was that, as I had never seen the school before I arrived, I thought it looked like my idea of the War Department. It was my idea of just the massive, very unsympathetic buildings. But what MIT did at the time that I thought was marvelous was to have a freshman camp. Freshmen were invited to come to a camp experience. It was held outside in Massachusetts somewhere and it ran for several days. We sat around the fire and people talked. I recall swimming in a lake at the camp, which had water as cold as I can ever remember in my life. I still can remember the ringing in my body, the sitting around the camp fire in the evening, and a group leader saying, “Look at the fellow to the left and the one to the right—only one of you is going to be there at the end.”

There was much more emphasis on the severity of the MIT experience at that time. There was school on Saturday, which was a new experience for me. I don’t think they kept that up too long. I lived off-campus, and I suspect it was related to a cost issue, I don’t know. I very much remember living with a black family on Dana Street, 55 Dana. I still occasionally go by to see if the house is still there. I only lived off-campus for about the first six months or so. I knew more people at Harvard than I did at MIT. I had a friend—a close friend—who was entering Harvard at the same time, so whatever social life I had, which was minimal, was with black students in that program at Harvard. I remember going into Walker Memorial at MIT, where they served dinner, and thinking that it was so fancy. I remember saying to myself, “My goodness, I’m not sure I can handle all this.” But eating in Central Square was so depressing to me that I finally decided to move on-campus.

I had entered in 1941, and on December 7 Japan dropped the bombs on Pearl Harbor. This event led to stark change at MIT. There was an immediate appearance of military people and guards and a shuffling of the living arrangements. I can’t recall the circumstances that led to my decision to move, but I moved initially into that complex of dormitories called Westgate, I believe.

On the west side of campus?

Yes, right. I was in there for a little bit of time. I lived with a student who was black. He invited me to move in with him, but we had very little in common. He was extremely religious, which was not my background. My mother was very interested in all kinds of new-age religions and Christian Science and all that sort of thing, so he would be praying on his knees in the room in the evening and I would be wondering what he was doing and what I was supposed to do. It really troubled me. We got along so poorly that neither of us would ever let anything be out of place. The room was immaculate. We didn’t live together long because the Navy, or some part of the military group, took over that complex.

I then moved into the Senior House. It may be that in the Senior House we lived together as well, I can’t recall. But at any rate, that also was short-lived because subsequent to that I moved, in the second year, into the graduate house. There were four of us living together. They were white

and from various parts of New York, I recall. I don't actually remember any of their names, except that it was very pleasant. I enjoyed that experience.

Just after we entered the war, everyone was acutely aware that they might have to go into the armed forces. I made, under the influence of the school, a decision to apply to the ASTP, an Army program which assured us that we would be brought into the Army for basic training and we would be sent back to school. At some time at the end of the second year, when I finished the term, I was told that I would have to take basic training. I received a letter from the ROTC program, which I was involved in, that said something like, "This man has had training in engineering and ought to be considered for the Signal Corps." Well, the Army had no idea what to do with that note like this about a black soldier, so I stayed in the reception center for a couple of months while they tried to figure it out.

Finally, they sent me to Keesler Field, Mississippi, later to be sent to some communication program. It was during my stay there that I learned about the black Air Corps. I saw in the newspaper, maybe the *Amsterdam News*, a picture and a short article on graduates from a bombardier navigation program. To me this seemed more like something I could do rather than being a fighter pilot, which was really the only Air Force option I had known about. So doubting that I would ever be sent back to school, I decided to apply to the aviation cadet program. It turns out that getting into that program was a little like applying to MIT. You had to get letters of recommendation—my parents assisted me in that—and you were interviewed and took exams.

Finally, I was admitted into the program. But as I didn't immediately go into the program, I continued to do basic training over and over. I'm not sure of all the details, but I do know that they had lost my papers. I couldn't get off of the drill field to find out what had happened, because if you asked what happened to your record, they just thought you were trying to screw off. They'd say, "No! You have to go to training." Finally, in desperation, I went against orders to the office to see the sergeant. He listened to me, looked up my record, and then said something like, "But you're in 747 and you should be in 707." He then proceeded to take my paper from one envelope and

move it to another, and the next week I shipped out.

It was a typical military screwup of the time, but I entered a pre-flight training program at Tuskegee, Alabama, on the college campus. You spent, I don't know, maybe three months learning things pertaining to aviation. You were "braced," the military term for hazed. They tried to run the program as though it was West Point. They marched and they sang. There was a certain esprit de corps to it. I recall it with fascination, but it was at that point that I was able to elect to go into bombardier navigation, primarily bombardiering, and I went off to several schools in Florida and Texas.

At the end of the training, I was made a second lieutenant and sent to Godman Army Air Field, which was an airbase next to Fort Knox. There at that base was a black B25 bomb group being trained. This group, even though it was late in the war, had not yet gone overseas. The reason was interesting. They were still at Godman, even though it was inadequate to prepare a group to go overseas, for it had too limited runways, among other problems, and that was largely because of racial prejudice.

This bomb group, when it was initially formed in Michigan, had been formed from black officers, many of whom had been overseas in the 99th Fighter Group, and some white officers with bomber experience. After the group was formed, the black officers were not permitted to use the officers' club on the Michigan base. They had objected, so the Air Force, rather than let them use the officers' club, moved the whole training program to Godman Field. There they couldn't get trained, but the white officers in the group could be invited to the Fort Knox officers' club and the black officers could use the Godman officers' club.

So when I arrived as a lieutenant with training in bombing, I was surplus and was told, like many other officers who arrived during the same period, "We haven't got anything for you to do right now, but you should use these bombing trainers and feel free to do anything else you like." As a young man, I guess I was about nineteen, that was marvelous. I had wings, I was a second lieutenant, and I could go anywhere in the country. If I were stopped by military police, which was rare, and asked what I was doing, I'd say, "I'm following verbal orders of the commanding officers." And

that was it. Fellows like me just went all over the country. I worked on my problems of getting to know girls, and for a relatively short period had a fair amount of pleasure.

This period came to an end when the Air Force, no longer training great numbers of aviation cadets, decided their solution to getting the bomb group trained and keeping the officers' club separate. They decided to move the 477th to an abandoned cadet field in Freeman Field, Indiana. The plan was to call the black officers "trainees," offer them the cadet club, and reserve the officers' club for white officers. The trainee term was to apply to any black officer, even the black flight surgeon in the 477th.

This plan did not escape many of the members of the 477th. I think of Bill Coleman, who later became Secretary of Transportation and whom I knew from Camp Atwater and saw again in Cambridge while he was at the Harvard Law School. He saw through the plan as soon as the move was announced. He came to me, and to other officers like me who were not officially members of the bomb group but were members of the base waiting for positions to open up, and said, "Now listen, this thing about trainee officers using the cadet club does not apply to you, so when you arrive at the base you can use the regular officers' club." This is exactly what we did when we arrived at the new base. We just walked into the officers' club. They immediately said to us, "You shouldn't be here, you're under arrest."

How many black officers were there?

Well, it turned out by that time there were about a hundred who were involved in this whole uprising. The next day they prepared a written set of orders, saying essentially, "This is to inform you that you must use the trainee officers' club," and we were to be asked to read and sign the paper saying that we understood and would obey the order. So all the people who had been under arrest were asked to come to headquarters and one by one required to sign.

I always think of this because it was entertaining. I joined a line which had formed in this building at the offices where we thought we were to go in. I was well along the line at another door when suddenly they opened the door in front of me, so I was the first person into the interrogation room. I entered the room and there was a captain

or a colonel and a few enlisted men who looked like they had been dragged in to be witnesses. I was told, "You understand that there is an arrangement here where you are to use the trainees' club and not the officers' club." I said I understood that. They said, "Do you agree that you'll do it?" I said no, because that was what everybody agreed they would say and I refused to sign the paper. Then you were sent out another door so that you wouldn't see or communicate with the others waiting to come into the room. Most of the waiting officers did as I did, although some officers who were mature, had their families with them there, and felt they had an investment in a career did agree. But most didn't care and thought it an obscene racist joke.

They just took the entire squadron and moved them all back to Godman Field, Kentucky. It was so absurd, some of the fellows put signs on the moving trucks about going back to their "Old Kentucky Home." At this point it had hit the newspapers. My wife tells me how she saw "101 Black Officers Arrested" in some of the black newspapers at the time. Anyway, what happened was that the bomb group languished at Godman Field for a month or two. Finally, the whole thing was dropped. They relieved the very prejudiced colonel of training, fired all the people who were white, and brought in the black Colonel B. O. Davis, Jr., and some of his officers to reconstitute the group under his direction.

It turned out that they never could get the group finally trained enough to go overseas. In reading recently about General Davis's life, I learned that even he had a hard time. Even though he was colonel of the base, he still couldn't use the facilities with his family at Fort Knox.

This is the General Davis, right?

Both father and son were generals. The Davis I am talking about is the one who had been colonel over the 332nd Fighter Group in Italy.

What happened for me personally was that I was then allowed to go into pilot training, so I went back to Tuskegee. While I was there, Japan surrendered and I came back to school. So the whole thing faded for me. As a single man and young, it was just an interesting experience with the South. It had ended.

I returned to school in the middle of the year. I had known my wife before I had gone into col-

lege. We had known each other as kids. We married the year I returned from the Army.

So she's from New York as well?

Right, she's from Brooklyn. During my Brooklyn period, I got to know her and had quite a crush on her. When she graduated from Hunter College, we married and returned together to Cambridge. It made an immense difference in my life. I often kid her by saying I waited until she finished so that she could keep me in the style "to which I had grown accustomed." She had majored in psychology but was in a teaching program as well, so we both thought she would teach in the Boston or Cambridge school system. When we got up to Boston, we learned that at that time married women were not allowed to teach. So she worked in various places and finally ended up at the Charlestown Public Library. I had two more years to complete at MIT, which was an entirely different world, with returning veterans like myself on the GI Bill.

As far as relationships with faculty and students go, I don't have any strong feelings about the first two years. There were a couple of people, I assumed were from the South—one chap in particular I remember because he did so extraordinarily well but never spoke to me even though we were in classes together. But most of the people were just friendly. Having grown up in New York, I wasn't particularly surprised to be in class with white students. I have no recollection of any faculty in the early two years.

In the second two years, we shared relations with people who had similar kinds of experiences. Two families we got to know quite well, and still see one of them from time to time. We lived off campus in North Cambridge. Again, a lot of our friends were people in graduate school.

At Harvard?

At Harvard, yes. A friend there became president of Montclair State College. Dave Dickerson was a good friend of ours. I remember also Herb Reid at the law school. He became head of the Howard law school. One person I should have mentioned before when we talked about my first two years was Henry Hill.

The chemist?

Yes. He was a graduate student at the time I was a freshman. He was very much a factor in what lit-

tle social life I had. I think he lent me a tuxedo once so I could go to a dance. He was very sensitive to the inner workings of MIT, far more so than I. I would say he was embittered to some degree with MIT. Anyway, he went on to quite a career. For a while he was president of the American Chemical Society, I believe.

The two years were a pleasant, interesting experience in Cambridge. You asked about faculty people who had some impact on my life. One was a man named Lawrence Arguimbau, a professor at MIT in the electrical engineering department, who was very outgoing. He was concerned and liberal. I recall him actually saying, "You ought to consider the Bell system because they are very sensitive to the concerns of diversity and black people." And I also worked for Professor Campbell, who made major contributions to the field of servomechanisms. He wrote a book with Brown that was one of the first books on servomechanisms. As a result, I became interested in controls. I actually took the Power option in EE, but was more intrigued by servomechanisms, which was largely a graduate program. At any rate, I worked in the Servo Laboratory in my second year.

When it came to getting a job, things were tight. I finished in 1948. There weren't too many openings, but I received offers from the National Advisory Committee for Aeronautics (NACA), which later became NASA. My first job was with them in their Langley Field Lab in Virginia.

This is after you graduated.

Yes. During the spring that I graduated, as I said, I was offered a job with NACA. I moved to Hampton, Virginia, with my wife. It was a segregated community, but it was at Hampton. The Hampton University campus was there.

Hampton Institute, at the time.

Right. That was the social community that we were part of. I worked at NACA for almost a year in Virginia. While I was there, they had signs in the NACA facilities that said "white toilets," but we ignored them because most people there didn't really go along with this leftover from the old South. I had good relations with the people with whom I worked, but I wanted to go to graduate school, as NACA was paying for graduate work. I wasn't allowed to go to the University of Virginia because they didn't take black students. The University of Virginia was where most of the

NACA people were going. When I raised the issue, it was agreed that I could transfer to Cleveland to their Lewis Lab.

My wife and I moved to Cleveland, and we were delighted to leave. At the time, Dorothy was pregnant and Cleveland had a fine obstetrics center. I lived in Cleveland for about five years and completed my master's program at Case Institute of Technology, later to become Case Western. I changed my emphasis to "controls." At the time, analog computers were the rage. While I was with NACA in Cleveland, I transferred to the research department and we worked on engine controls. My colleagues and I wrote a paper on the use of hydraulic servos in the design of wind tunnels.

When I graduated from Case, I applied to a couple of companies. One was Minneapolis Honeywell and the other was Bell Laboratories. Both made offers. I remember going to Minneapolis and they were marvelous to me, but they didn't invite my wife. It was September and it was already snowing. When I got back, I couldn't describe the place very favorably. We had had enough snow and ice, and my wife was anxious to get back to the New York area. I didn't know a great deal about Bell Laboratories, but it was the preferred choice between these two.

We moved back to New York. Bell Laboratories had not hired any people during the long period of the Depression. They were just now bringing new people into the company. In royal fashion, they put you in school for three years. The first year you went two or three days a week in a program which was taught by the staff of the company's research department. Then in the subsequent years, we went to class once a week and rotated to different areas within the company. I worked in three departments. One of them was the transistor development department, not long after the transistor had been invented. There was a great deal of activity in this area. Aware of its importance, they wanted to use it in equipment and they wanted everyone to have experience with the device.

The people I worked with in my home department were great. I recall my first supervisor, John Shields, who in particular was just marvelous. He was a Quaker. He was very supportive of me and he had an encouraging and exciting mind. He put me, along with two younger engineers, on the most advanced work the switching area was doing.

It led to the writing of the article I showed you earlier. I also did further graduate work at NYU in mathematics. I guess I would have gotten another master's degree in math, but the Lab was moving to New Jersey. The company thought it was enough if you completed their Communications Development Training Program, the three-year program I have already mentioned. At our graduation from the program they had a big celebration that made you feel that you were slated for good things in the company. Indeed, I was made a supervisor and later a department head. I worked on the first nationwide long distance dialing system and the No. 1 ESS, the first electronic switching office.

One of the factors that affected the company in the late '60s was the civil rights revolution. There were riots and fires in Newark. There was this feeling in the management that the telephone company had huge investments in these communities and that they had to somehow respond to this outcry. They started a program called the Urban Minorities Workshops, where they brought in employees, initially the top management, to try to help them understand the feelings in the black community.

It was an interesting and extremely well-managed program. They tried hard to sensitize fellow workers, who were in another world. People who would invariably say, "I don't understand what this has to do with me, I never treated anybody badly"; they wanted them to have some sensitivity to the anger, frustration, isolation, and even envy that was felt in the black community. They wanted them to understand what is appropriately called "institutional racism" under which qualified people would be passed over because, as managers would say in confidence if asked, "We never thought of making the black employee the supervisor or department head because we never saw anybody that looked like that in that job." They were not aware of the unconscious thinking. The workshop stressed that these attitudes had to be changed from the top down. The management had to say things like, "Well, what are we doing with Ransom?" or "What are our plans for this person whom no one has ever seen in a management position?"

This was the kind of thing they tried to deal with in the seminars. I was asked to take part in scores of workshops. I became "workshop-hardened." It was a stimulating experience, but I was

uncomfortable with it after a time because I didn't enjoy the repetition and I didn't find easy the confrontations with people.

On the whole, I thought working for the company was great. When the Bell System was dismembered, they formed Bellcore and I went with the organization because I had been working on planning for telephone company systems. It was a logical transition. I retired from Bellcore five years later. I was at that time Division Manager of Network Technology.

One other thing that's very important to my MIT connection. Just after I was promoted into the management, in about 1965, I was asked to recruit for BTL. In Bell Laboratories, they assigned you to the school from which you came, and you went back year after year. So I started going back to MIT twice a year. I also joined the Educational Council at the time. I thought it was a good way to see the students coming in and to be involved with them when they graduated. As a result of these two connections, I saw a great deal of MIT.

At the beginning of my Educational Council connection, I was invited to come up for a conference they held for guidance counselors and new members of the Educational Council. We were put up at the Copley Plaza, brought over to the school, and given lectures on life at MIT. It was a mix of new educational councilors and guidance counselors. It was a terrific program. They tried to explain their programs, their attitudes. I felt that MIT had quite thoroughly changed. I mean, there was a real sensitivity to students. Their attitude to the student was, "Look you're mature, you're bright, we want you to finish. We'll go along with you if your proposals make sense." They even said, "If you don't want to go to school this year, fine. Do whatever it is you want to, if it's worthwhile, and we'll wait for you when you return." Perhaps I'm overstating it, but I thought that it was marvelous and my contacts with the school have been characterized by that kind of openness since I became reconnected.

About the same time, they began to admit black students in large numbers and they began having the conferences that were held by Mary Hope. We became friends. I used to come to all of them. I even gave talks at some of them. It was easy because I was there representing Bell Laboratories, the company that even helped finance the programs. At the time, Pamela was applying to college.

Your daughter?

Yes. She was a very impressive applicant. She was admitted to everywhere she applied, including the first class of women ever admitted to Yale. She turned Yale down for Harvard. She said that she didn't want to be in the first class after she thought about it.

She did not want to be the first?

I guess so. Anyway, Pamela ended up in Cambridge and, when I visited MIT, I used to see her too.

You mean at Harvard?

Yes—Radcliffe, to be more exact. When I would come up to visit MIT to do recruiting, which I did at least twice a year and sometimes even more often when Mary Hope was having a conference, I would use the occasions to take Pam to dinner. So I had a chance to see her throughout the four years of her Harvard experience. When she graduated, she decided to go to Africa to teach in a program under a special Harvard College program. As I understood it, the students raised the money for the program.

During this period, I had a funny additional experience. There's a certain amount of emotion connected to it, as I reflect on it. Pam said to me by letter from Africa, "I think I'd like to go to MIT, I'd like to study urban planning. But since I'm over here, I'll need your help with preparing the application." I, of course, agreed. However, I was surprised because I had not known that she had developed an interest in urban planning. Initially in college, she had started out in art. Somehow she decided that it wasn't relevant to today's problems and switched to philosophy. She's really very artistically creative. Sometimes I wonder if she made the right decision.

But to get to the point of this story, she asked me to help make her application out. So I had to get her transcript and go through all the courses she had taken. I was shocked at all these courses she had taken in art and philosophy. I guess to an engineer they seemed somewhat irrelevant. But I submitted the application. Actually, she had done quite well on the whole. She had graduated *cum laude* from Harvard.

I had to pull that out of her, you know. She's so reserved about how bright and intelligent she really is.

Well, she said that she had an interview with you. Later she told me, "I really enjoyed the interview, but I had a lot of reservations before we started." I

guess she felt like I do: I mean, you don't particularly enjoy talking about yourself, but you do occasionally have to let folks know how bright you are.

But I started out to tell you a different story. I was asked to do something by Bob Weatherall. Bob is just a marvelous person. He was head of Career Services and we became good friends. He came down to our area once to speak. We had an MIT open house for potential new students and he was the MIT guest speaker. I remember he stayed with us and we gave him Pam's room. Later he told us, "You know, I saw Pamela walking through the halls and said to her, 'I slept in your bed last week.'"

Anyway, as I said, I completed her application and a number of months passed. In the spring, I was asked by Bob Weatherall to come up and speak to a group of students he had invited to get acquainted with the placement office. They were mostly black. I was asked to talk about life in industry, and recruiting, and so forth. While I was up there, it was about the time they would be deciding for the graduate school. I decided to go to the urban studies and planning office, wherever that is, and see whether Pam had made it. After all, I had helped make up her application. I went over there to the office. They looked up her application and said, "She hasn't been admitted." So I left and thought, "Well, this is how all the parents and students feel when their application is rejected." I knew how much pressure there was on the school, but I was a little surprised.

Anyway, some time later I learned that I had been given the wrong information. She had been admitted. She returned from Africa and entered MIT, and we continued to see each other over the years that she was in the program. So now that Pamela was a student at MIT, I had one further connection to the school besides the Educational Council and the recruiting. I was a parent. Through all these different connections, I really developed a much stronger feeling for the school—stronger, in fact, than I had as an undergraduate.

I also get the impression from what you're saying that it really was a pleasant experience throughout your undergraduate years at MIT.

I guess I want to say it was a "hard" experience for the first two years. I didn't do nearly as well as I thought, coming from Stuyvesant. I had done well there and I was surprised at MIT. I had the feeling that everybody else was having a good time and I

was stuck in this machine. There was a social life among the students in the Ivy League schools. They would have parties and so forth, and I was really anxious to be part of that. I was hanging on the edges and worrying about the fact that I was so out of it. So again, I didn't have any strong feelings about the place.

Were these black students?

Primarily.

Primarily in the Ivy League schools that you are talking about?

Yes. Things did improve a great deal when I returned from the Army married. But again, the positive feelings came out of the later connections with the Educational Council, as a parent, and from recruiting. I brought into the company several blacks who have done extremely well. I can't remember their names offhand. That's one of my failings, but I know one is a vice president now. Another fellow is also involved with BAMIT. He is, I think, teaching at a college. These two were just so bright. They had done very well in the electrical engineering department. I was thrilled to bring them into the company, because by and large I was dealing with white graduates.

Based on your own experience, is there any advice you might offer to other blacks who may be entering MIT or who may be entering the work force, particularly in places like Bell Labs?

I think that some of the best advice I'd like to pass along I heard at a guidance counselors' workshop, about a student who had been asked to leave MIT for some emotional problem he had and then returned to make a new start. He said, "You know, there is a great deal of help here at MIT—help of all kinds, academic and psychiatric. But they can't force it on you. If you don't ask for it, it will do you no good."

I think that is the advice I would give to someone entering MIT or industry in a company like Bell Labs. If you are admitted to MIT, then MIT thinks you can do the job so they don't want to lose you. Similarly, if you're hired by Bell Labs or a company like the Labs, it's much the same. They think you can do the job and they don't want to have to find someone else. So if you find yourself having trouble or getting lost, *ask for help!* My experience is that people really like to help.

LOUIS YOUNG

SB 1950 (aeronautical engineering) MIT; senior design specialist, Lockheed-California Company; computed loads for various aircraft, 1950-1953; conducted basic research on aerodynamic heating, 1953-1959; analyzed fatigue test loads for aircraft and evaluated theoretical methods for analyzing fatigue and service life, 1959-1965; developed procedures for fatigue analysis and substantiation, 1965-1966; responsible for setting up fatigue and static test loads for AH-56A Helicopter, 1966-1972; evaluated scatter in fatigue test data, and conducted statistical analysis of test life reduction factors, 1972-1978.

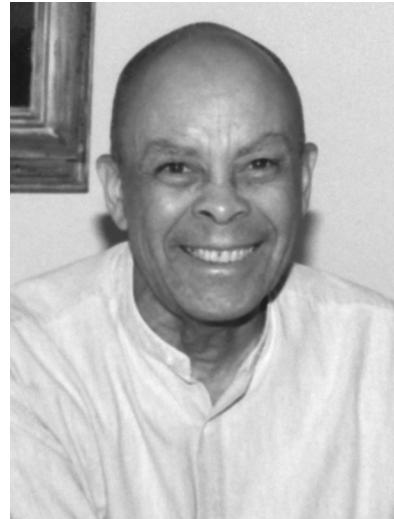

I grew up in Detroit, Michigan. My family lived in a poor section of the city at the time. We eventually moved to another poor section near the streets along Boston Boulevard and Arden Park, where some rich white folks lived. As a result, I got to go to the excellent Northern High School, where forty-two blacks were enrolled. We got a very good education, with me having an 89% grade-point average. Of course, we had classes like calculus, Latin, biology, chemistry, and physics—the whole works. In my time, they had mostly white kids going to Northern High School. Now this school is located in a very poor neighborhood.

My wife died around 1980, early '80s. It was a sudden surprise to all of us. She had breast cancer. I have one daughter who now is forty years old. She's studying pharmaceuticals at the University of San Francisco and she's doing quite well there. The problem I have is I'm trying to stay single as long as I can. It just gets more difficult. You just have to be cautious about what you do, where you go, and what you say, and not be influenced. I get around quite a bit.

I was one of the original Tuskegee Airmen. I got out of the military in '46, and when I left there I went directly to MIT. I went to Tuskegee first. When I got out, the military paid my way. At that time it cost eighty-five dollars a year to go to MIT. What they told you when you first got into the Institute—you get in that big hall where everybody sits together—"Look at the person on your left, look at the person on your right. Next year two of you won't be here." What you noticed—that guy was an educational counselor for some of

the younger kids, he'd come in and you would sit at his feet and the freshman were really nervous. Juniors are a little more confident, and when they get to be a senior they think they know it all. You can see the changes in people.

I think one of the things you had to do when you were at MIT was learn how to read people. I used to fight some of the professors in mathematics, and I liked math. One professor, I talked to him in my freshman class. I had a question on something he put up on the blackboard. He said, "I want you to remember something, young man. When you're in church, you don't argue with God. When you get in my class, you don't argue with me." So I learned a few things there. Then I found, as it got later in the class, sometimes I would walk into a class and I wasn't that good at it. But the thing was, the professor wasn't giving

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with Louis Young in South Pasadena, California, 13 March 1997.

the right kinds of books and things to study and prepare for the class. I walked in boldly one day and asked if he would give some additional books and information. "What would I need to solve those types of problems?" He was very happy to give those to you.

So it took a little politics and knowing how to handle yourself. People in the classroom worked together. I stayed in the dorm. We had our meals downstairs. The meals came with the room.

That's a beautiful dorm now.

It's the women's dorm now, the brick building.

The twin building. Was it a twin?

Yes, that's right.

I think that's Burton.

It was across Massachusetts Avenue, on the other side of campus.

That's the East Campus, but you lived on the west side. When you cross Mass Avenue, where they now have the Student Center, you go down the alley where there are a lot of buildings—fraternity houses and things like that. There are also those larger dormitories. I think Burton House is one of the older ones. That may be the one you're thinking of.

This was a new brick building. I got into it probably about my sophomore or junior year. I lived there for a while. I had a single, very small room. The white boys seemed to be rich. They had all the booze you'd want. You didn't have to buy anything.

How did you find out about MIT?

What got me started was that in Detroit I loved airplanes. I made model airplanes. I'd look up in the skies and watch some of these creeping on the airbase. The thing I remembered about them was that they did not make their moves too strong. I'd hate to see them fly up and all of a sudden, boom!—the wings going that way and the airplane goes face down. So I got really interested in aeronautical engineering. I went to Wayne University for a little while before I could get into anywhere I wanted. They told me that the only thing I could ever do was to be a mechanic in that day. I didn't actually get to be a pilot. I got to be a navigator. But I still wanted to be that pilot.

When I got to Tuskegee, I immediately got shipped up to navigation, being a navigator. They didn't have many people who were mathematical

there. Here we were in a sort of a segregated deal. We'd go in to breakfast at 7:00 AM, and an hour later the white students were by themselves and they ate. They kept us completely separate. Worse than that, we couldn't even get a list of places to get a haircut or anything like that. We were considered completely different from them. I had to walk gigs. I decided all my gigs on that day. In order to get a haircut, I had to go sixty miles from Hondo, Texas, to San Antonio. So every time I had gigs, I managed somehow to get to San Antonio that weekend.

At the barracks, what they did there was put the white boys to bed first. After they go to sleep, they bring us in and in the morning they took us out. Things like that happened. Then later in the war, there were a lot of guys coming back from overseas. We heard about what they had done over there. I'm trying to think of that—not Omaha. There's another big station.

Oklahoma?

Yes. We got there and the guy who was doing overseeing, when you walked into those barracks they made sure that we were treated right. We had separate toilets and all that sort of stuff, but we got pretty nice treatment. The thing that was bad there was you could do the least little thing wrong and they would kick you out. You had to be a person who could stay cool under pressure.

All of you in the Tuskegee Airmen get together every year, is that right?

Yes.

About how many of you are still alive?

I'd say roughly about 450. There were 996 pilots, including navigators.

They had a big write-up on all of you in Ebony magazine not too long ago, if I'm not mistaken.

That gave me all kinds of headaches. They wrote about the Tuskegee Airmen Scholarship Program and I'm the chairperson for that right now. I got about five hundred applications between August and November, the write-up came out some time in the late summer. We close our applications on January 15. That article just carried our mail right on up all the way.

You know all the Airmen, for the most part?

All of the Tuskegee Airmen? It would be impossible. I know most of them. The ones that are still

Tuskegee Airman, 1940s. Source: Louis Young.

surviving I see in national meetings and things of that sort.

For the record, for those who have no sense about that achievement of all of you, could you talk to us a little bit about what you saw or what you see at the moment as to the achievement of that group of famous men?

Right now we're the talk of the town. Today I had a free pass to go to Randolph Field to celebrate the fiftieth anniversary of the Air Force. They had the 1947 Northwest Virginia Second Infantry. The Air Force, 1947 to 1997, is a fifty-year span so they had a big party. It was really nice. We stayed in the officers' barracks, real nice barracks. It was a beautiful view. Nice gifts and everything else.

You said you initially wanted to be a pilot, but because of your ability in math they wanted you to be a navigator. For the record, what's the difference between the two? Any idiot could fly a plane. There's nothing that I wanted to do more than become a pilot. I loved the airplane. I wanted to get my hands on the stick and stuff, but I always got shifted away from it a little bit. When I did get my hands on the plane, I was working for Lockheed. I thought I was the first black engineer in the aircraft industry. Joe Dunning was also an MIT graduate. Mr. Dunning was actually the first black engineer in the aircraft industry. He died while he was a vice president at McDonnell Douglas. He wound up being the vice president at McDonnell Douglas before he died. I was the first black in the engineering office at Lockheed. I don't know who the first one was up at Boeing. I came in 1946—no, 1950. I got out of the military in '46 and it took me four years at

MIT to get to '50. I was the only guy in the aeronautical engineering class to get a job in 1950 for six months. I got mine immediately. But at my proudest moment, when I had this gal with me that I was going to get married to, we were standing in the elevator before graduation and this white guy got on and said, "How come this goddamn nigger can get a job and I can't?" I learned that not only was I the only black in the aeronautical force, but none of the other students got a job until six months after I did.

I was not the first black at Lockheed. I was the second one hired. What happened was the guy from Lockheed, when in Portland, came out and we hit it off really good. We became really good friends. I got back to Lockheed when I came out to California. Initially what happened there, before I got out of MIT—in my junior year—the Navy wanted to see what they could do about getting some of us to work for the Navy, particularly people interested in the aerial courses. I got with them. We got to Port Hueneme and they didn't show up. They wouldn't serve me in a restaurant. Then they put us on the base. We stayed on the base and then they would get us the food. There were twenty-seven of us from MIT. I came into town to visit some friends I knew. The guy that was in my class as a navigator, he was married like pretty normal, but his brother, Bill Terry, was a real lady's man. He and I got together, every time I came in to Los Angeles from Port Mugu with just a month to stay there. What they were doing there is they were firing rockets that have wings on them—if they could fly it would be nice—and they put on four boosters. But they let these boosters sit around for about four or five years, and what happened was they lowered the intensity of the power that they could put out. If you put these on a plane, it would shoot out with these things and the wings would come off right away because you're putting 40,000 pounds of force on it and it only expected 10,000 pounds to take off. So they were just going up and down, up and down. We learned a lot about controlling the stuff like liquid nitrogen and sulfuric acid. We were working with a lot of dangerous stuff. You could take a little steel bar, drill a round hole in it, put a pipe on top of it, and drop a marble in on nitric acid and sulfuric acid and see it shoot way up in the sky. It was really nice.

So basically, I pulled some good contacts in L.A. I went back to MIT and got the job at Lockheed. The thing that happened there was that it came nice and easy to me for a while. I had a lot of hard things to go through, but you wake up. People try to take advantage of you sometimes. Some things that I was working on, other people would take my name off of a good report. They'd get the credit for the report and sometimes got trips and rewards for stuff that I had built. The thing that happened was I had to learn the game. For example, when they thought I was going to leave. One time I got a job offer to go to Martin Marietta, but they were then in Denver, you see. Everybody gave me flak about this and that. It turned out I was making \$30,000 a year at that time, and everybody was getting ready to take this big job down there if I had to move. Twenty-eight thousand dollars a year to stay. I had 120 people working for me there and I was only working for me.

That was a year of strife. I ran into a lot of those superficial deals at Lockheed. They wanted me to go to Israel and get into that field and travel between two towns in Israel. Of course, you've got the offices here and the computer centers sixty miles away and I've got to go back and forth between those two places. I was making at that time \$22,000 a year and they were going to pay me \$18,000 to go. Now, all these situations were set up a little bit phony and I knew it. I started playing the game just the same way that they played it, and that kept me out of most of the company. I did destroy one piece of structure there that cost about \$400,000, and nobody said a word.

I'll tell you something that a lot of people don't know. I got pissed off at Lockheed. Let's see, how shall I say this one? Oh, I remember now. It was a deal where they wanted me to go to work on the C-58. I had worked on helicopters, fighter planes. I had worked on practically everything they had. Anyway, the guy called me into an office to talk to me—one of the big wheels—and his discussion at that time was about the fact that he had given me \$688 a week to go to Atlanta. While he's sitting there, the phone rings. He says, "Oh, hi. I want to talk to you two guys. Mr. Young is thinking about going to Atlanta and we'll give you \$2,000 a week to work for him." So I just sat there quietly and he came back and we kept talking. One of the guys, Mr. Pappin—he's a retired boss—

was going to get up a section. So he said, "We're going to do this section"—the fuselage, the landing gear, the wings. I'm supposed to help all these people and make \$680-some-odd dollars a week. So I read *The Peter Principle*. Have you heard of the Peter Principle, the theory that you reach your level of incompetence?

What I did was came home one day and thought about it. I said, "If anyone ever makes an offer that stupid, if it costs me everything I've got to do it." I put on striped pants, shepherd shirt. I put a noose around my neck, put a hat and my raincoat on, and picked myself up. I walked into the boss's office, threw the hood off, and said, "This is how I get dressed when I go to Georgia." I walked up and down the plant for about an hour-and-a-half. Then I put my coat on and covered up to have protection if I got arrested. I went home, took a shower, came back in a suit, and wore it for six months. And nobody ever said another word about it to me. I got a raise, too.

You had guts.

It reached a level of incompetence where you're getting screwed anyway because people were taking a lot of my work and taking credit for it, and I knew it—that sort of stuff. Actually, let's go back to that \$2,000 for these other guys. If I had been stupid enough to say, "I will take the \$2,000," I would have gotten it but it would have killed me too, at the rate I'd have to work in order to maintain that level of intensity. What you have to do is work at levels. There was a question there. If I got in that amount of involvement in that C-5 structure in Atlanta, I'd be a dead duck. I'd been working really hard here. A guy died. They wanted to put me in charge. There are idiots down here that have been working with some aluminum alloys and looking for strengths with 70,000 psi. They've designed this stuff up to a million psi, which no material could take the way aluminum would. They made me the lead man, but not the boss. I'd stay over a weekend and write a good report on something when everybody else had left. Someone else would get promoted.

So I got stomped. I didn't let them walk over me any more and I didn't get mad at anybody. I just did my share of the work. When I left there, I was working by myself. People from Georgia came and threw every piece of paper I had away, all the details. I didn't feel like going back to work. I had

been job-shopping for a while and things didn't look too nice. They were working like sixty million dollar deals. They were building planes that were assembled in Panama, all of them. The structure wasn't designed right there either. I'd look on one page and wonder why it stopped there when it should have gone way up. They didn't use the right size sheets of paper. It cost the company about sixty million dollars. When we looked at these sorts of situations, we tried to stay out of problem situations. When people came in from Georgia to replace me, they threw every single piece of paper I had away. They cleaned out the bookcases.

So they asked me would I go down to Atlanta and work on this plane. I said, "Yes." I thought at that time I needed a rest. I thought I'd only stay for two months. I took two weeks off after the first two weeks to go back home to make it easier. Anyway, what happened was all the stuff that I had done, I was smart enough to put it on the computers, but I put it in remote storage. They didn't know about remote storage. When they said, "We'll go up and dial in and get this stuff," they dialed in and there ain't nothing coming up. Then I dialed and I got everything. I got stacks of data coming out. They treated me like a king. Someone tried to say something to me. It was interesting when I went to this place for my farewell dinner to see me get up and speak and I'm the only black in the room. Everybody is wondering, "What are you doing up there talking while all of the white people are sitting down?" It was interesting. I actually got pleasure out of that.

What company is this? This is all at Lockheed?

Lockheed, Atlanta. To tell you how good it was, I mean good, when I got off the plane on the first trip—I took a couple weeks off and went back—I went out to get my car and there was a brand new Lincoln Continental.

This was what year?

That was roughly about 1986. I got a brand new Continental that I used for these two weeks. They gave me a smaller car when I came back the second time. I had a suite of rooms at the Embassy Suites, non-itemized expense accounts. It was nice. I had a ball. I enjoyed it.

What I'm saying is you read these things and you sort of protect yourself. The reason I had to turn down most of these jobs was because when they had the Electra Aircraft fiasco and the planes

were going up, what happened there was they didn't make the leading edge strong enough. They had a propeller-driven system. Here's the leading edge here; out here you've got a great big propeller spinning; this part where there's folding is weak, and you're doing what a gyroscope is doing because this propeller will spin and rotate like this. All of a sudden, the propeller went *spsssh*—take the whole wing off and you wind up falling to the ground about this deep, airplane and all. Those sorts of things happened.

You'll never believe the hours I have worked. Sometimes I know I worked twice the hours. During that crisis, they'd go to a restaurant and just booze all day. We didn't get much work done, but we sure were happy. I'd work from like seven o'clock in the morning and I'd leave here at 5:30 the following morning. I'd go home and take a shower and come back to work. I would work twenty-three hours on one survey. I hated it. I went from roughly 140 pounds to about 220. I finally lost the weight. It was a fight, but the thing was I got what I wanted. I could have gotten the \$2,000. But the way that I had been working, I figured it was going to kill me. That's why I had to think about acting crazy. When I walked in the way I did, I didn't give a good God damn. If I stayed I was going to be messed up enough. You get into those sorts of situations, but actually it wound up good for me.

How long did you stay with Lockheed?

From 1950, thirty-eight years.

You had different kinds of positions while you were there, based on what I hear you saying, and promotions during those thirty-eight years.

Well, you didn't get the promotions right away and you didn't get the promotions until you decided to fight for them. Like in the Electra situation, that woke me up and I said, "I'm doing all the work and they're getting all the credit. No. I'm not going to let them do that to me any more."

You had to fight for what was yours.

I did. When I did all this crazy stuff, when I went home and took a shower and went back in a suit for six months, nobody said a word to me about how I had acted. When I went to Atlanta, when I walked in they treated me like I was God. "Don't be afraid, Mr. Young. You can do that." I had a ball. It made up for all of it, all the bad things I men-

tioned. Then they put me into the job-shopping bureau. You make much more money than when you work in the factory. I worked there for about three to four months and I quit that. It was a good feeling to make \$2,000 a week or more.

Now, let me backtrack just a little. How would you describe your experience at MIT? You did your undergraduate work there. How would you describe that experience coming in—what—in 1946? First of all, you had to be extremely good to have gotten accepted, particularly as a black student coming to MIT in 1946.

What they didn't know, we were poor blacks living in a poor neighborhood, and right next to us was Arden Park and Boston Boulevard. And right next to them was Northern High School. It was a classic, it was the best kind of high school you could ever go to, except they had a technical school downtown that people went to. For a straight high school, I had Greek and all that stuff—Latin, calculus, physics, biology. Anything you name, we had. You had to be good.

How did you rank in your class? How did you do in your class? They had class ranking, right?

Yes. I was at the eighty-nine, ninety percent level.

When you finished, that's when you went into the service. I went into the service. I tried to get into Wayne University and I went there for about a week. The reason I quit was they told me I could never become an aeronautical engineer and I didn't want to be anything else. Then I worked in the Hotel Palmetto and I didn't like the kind of tips you got. Back in those days, women asked you to go out and get some beer or something—whiskey—and they opened up just about this much, and that's your tip. That was making good money? I said, "To hell with it," that sort of stuff. Then what I did was I worked in the factories. I volunteered once for the military and they turned me down because of a heart murmur. Then I tried it again and I made it. So it made me feel pretty good. I wanted to be a pilot bad.

So that's when you went into the service.
Yes.

Then while you were in the service, you went to Tuskegee.

Basic training first, and then Tuskegee.

Now, this movie they had out, do you think that movie indicated essentially what happened in general to the air-

men that they trained and so forth? Did it have the major issues in that movie?

What you really have to know, at Randolph Field they have all the records. You had to be awfully careful. You could slip up just slightly or do something slightly wrong and get kicked out. The guy buys this new suit and new bars and things because he knows he's going out as a lieutenant or something, and the day of the graduation he doesn't hear his name called. All that sort of stuff. The least little thing would get you—just looking at somebody wrong or just saying the least little thing. You had to be awfully sensitive in interacting in that place, and that's how you did the white folks. You figure out what they're trying to get you to do and you find ways to keep doing it, doing it better. You had to play the part. You had to learn how to play it quietly and not angrily or in a personal way. You sort of have to do something first and then you figure out finally what happened. Why you're doing it is because somebody else is putting the pressure on you. "What can I do to take this pressure and reverse it the other way?" That's what I tried to do and I did it. I didn't always get away with it.

There were very few blacks at MIT when you were there.

There were six blacks from India. They don't consider themselves black. I was really the only black there my year for four years.

How were you able to get into MIT when there were no others there?

I was an honor student at Northern High School. I had things like Greek, Latin, calculus, biology, chemistry. There was a bunch of rich people living on those two streets next to this high school. These kids, I played tennis with these white kids and all that stuff in Detroit. I was the only black fellow with them, just because it wasn't social. Right now I wouldn't send a dog to that high school.

You applied to MIT, though, in a way like they did, I guess.

I took the SAT test and you did whatever you had to do to pass it. We had to take a series of tests.

You must have done well.

I was good in math. I still am.

Do you remember what your math scores were on the SAT's? Were they the SAT's in your time?

That's a long, long time ago.

I know it is a long time ago, but you know you did very well.

Yes.

Did anybody visit you to talk to you before you were admitted? Do you recall as to how that process occurred? I went in and took a test when I got out of the military to go to college. I applied at MIT and they accepted me. I was so isolated the first year. I approached some professors who were giving me a little trouble and conned them into doing things the right way, at least consider that I had not made a mistake when I had made one. The other thing that happened there is that you had to hit the ground to do what you want. The other thing that happened there that was really strange—since I was the only black boy, they had a \$150 scholarship for black women, and I got that. That was in my third year. I got a job there correcting stuff from professors' classes and stuff like that.

You must have been outstanding. You were what we would now call a teaching assistant.

Except for one thing. The only thing I did wrong, and it really was wrong, is I cheated one time in my last year. The white boys had a copy of the test that the professor was going to have and we all studied that, and they gave us another test. I'll never forget that one, though.

You had to be very good.

It's reading people and reading situations. For example, when I did that crazy thing with the clothes and booze and all that sort of stuff, I didn't give a damn if they laid me off for that because it couldn't mean that much to me. They were killing me slowly. You go from 140 up to 220 in a period of eight months. They never helped me. It was a big mistake. After I got to be 220, I went to a private hospital and the doctor told me I had to go on a diet. What happened was the nurse gave me a child's diet. The only thing I could eat on this diet for breakfast was one piece of toast, one tab of butter, and a cup of coffee. Lunch consisted of cottage cheese and raw green vegetables, one piece of bread, half a cup of tea, and stuff like that for dinner. What I'm trying to say, in effect, was that in thirty days I got down to my regular weight. I've never seen anything work that well.

To give you an example, I can't remember the exact year but I went home and I was at this gross weight—I think it was '72 or '73. What they

were doing there, they would take trips across to see whites in different countries. They wanted me to go around the South and recruit blacks. I was going in just prior to complete desegregation and I was staying in white hotels and stuff like this like in Nashville, Tennessee, at the college there. If you could have just seen me in this. Every little thing—"Is the coffee right? Is the tea right?" That's what it looks like. The white guy was going out to—not Alaska, but China and places like that. I knew what was going on. But when I got that weight, it scared me to death. It helped me a lot, though. I had a lot of built-up pressure because I'd had enough of it. It taught me a lot of things about how to get along with people and to handle different types of situations when they didn't pay you well.

Who were and who are your heroes and role models and mentors? When you look back on your career, your education, who would you consider your role models and your mentors?

Well, my mother pushed me pretty hard. The trouble with it, at home what happened—when I was a little boy—I got beat up a couple times. My mother somehow got me into a private school. They used to keep me there late at night if I didn't get my work done. You didn't go home until you got your work done there. When I started in the black schools in Detroit, I got all the hard courses. That gave me a good start. I like math. I like people, but the thing is jobs are more politics than anything else. If you get angry, you lose the battle. That's why I had to keep my head together. I might not have adapted to it, but I had to do it to keep it cool before I got my act. You don't want to get in and shoot off unless you don't have anything to lose. I had a lot to lose. So you have to read the people and know how to handle them without getting angry.

Is there any advice you would give to a young Louis Young coming up now in terms of his career and what he needs, just based on your own mostly very positive experience and learning experiences that you've had?

Believe in yourself. Do what you have to do. Because once you give up, you're not going to make it anyway. No matter what the odds are, you've got to pay a little dues. I loved that place so much I don't know what would keep me away from it. That was my philosophy. The thing that hurt me was knowing math and not being able to

do it as a pilot. I used to watch these Cleveland airplanes, air races live around Detroit. "Why are those things going up? You planning on going down like that?" "I don't want to do that." I really got disgusted when I got into navigation, but right now it doesn't matter. I was a very poor boy in Detroit. We were on welfare and all like that. What I'm basically saying is that things look up, but they don't always work out the way you want them to.

You retired from Lockheed in what year?

'88 or '89. I worked about eight or nine months after that, horsing around. Then I just quit altogether. There was a lot of traveling, seeing Europe. I remember the Asian part.

You really enjoyed the traveling.

Yes.

Is there any topic or issue that you can think of that you would like to say that comes to mind as you reflect on your own experience, and on the experience of blacks at MIT or in your own career?

The problem I had with my daughter, and she's not dumb, is getting her to believe in herself. When she looks at a tough thing, she gets scared. What I keep trying to tell her in the middle of this is that once you get scared, you've lost the battle. You've got to keep believing in yourself no matter how hard the situation gets. I played a lot of politics here. For example, as chairman of the board I got up sometimes and told people to shut up in a meeting, then walked by them politely and said, "I didn't really mean it" and give them a little pat on the back. Stuff like that. So my name got put in a time capsule. They twisted a cylinder into the ground and when the hundredth anniversary passes, my name will be there as the chairman of the planning board for those years.

*Chairman of the planning board of—
South Pasadena.*

You played a major role.

That was the only time I did anything. The trouble I ran into, it was these old white women would start chasing you around and stuff and you had to learn how to avoid them. I know. I think we're maybe the third black family in the area. I got involved in politics with these people. You've got these people circulating when we were married and all that sort of stuff. Sometimes you would

find out from someone else that they were in the process of getting a divorce. There were those who were trying to find out what these black folks got, and I didn't want to deal with it. All of them are married. Not one was single and they're trying to get me in an affair. And I wouldn't do it. For example, they had a picnic over here one day and I went over and talked to a couple of guys. One guy I hadn't met before. I went over the next day to a meeting and this time it was all the real nasty, nasty words—sat down and didn't say another word during that meeting. When I walked out, three women asked me if I would go out with them. They're all married. I said, "No." I avoided that. I had talked to one of their husbands the day before and he was talking about her. So you had to avoid these sorts of situations that are wide open. That's the big deal.

Well, I guess I can see why you've been very successful.

LUTHER T. PRINCE

SB, SM 1953 (electrical engineering) MIT; president, Manpower Inc., a non-profit corporation working on economic development issues in the inner city; director of business development, Urban Ventures Leadership Foundation; previously worked in engineering research and development, and was president, Ault Inc. and Prince & Associates; president, Minneapolis Urban League; elected to Minnesota Business Hall of Fame.

Nothing at MIT prepared me or conditioned me to even think in terms of going into business, so principally I just thought of being an engineer. My goal in life was to be a good engineer. Nothing ever prepared me for going into management and thinking about business ownership. A lot of us, when we get into situations where that would be an option, don't even think about that.

Well, I shouldn't say that. I should say *I* didn't think about that. The only reason that I ended up owning a company was because I couldn't get anybody else to buy it. I knew it had to be purchased because I had a big argument with the owner. I worked for him and I wanted him out. He wanted out, but someone had to buy him out. It never occurred to him that it could be me. It never occurred to *me* that it could be me. I kept looking around trying to find somebody else—"You guys want to buy a company? I'll run it, but will you buy it?" My wife said, "Why don't you try to buy it yourself?"

So that's what happened. We bought it with borrowed money. I never would have done that. That wasn't in my strategic plan.

So actually, you got into ownership in a very unpredictable way.

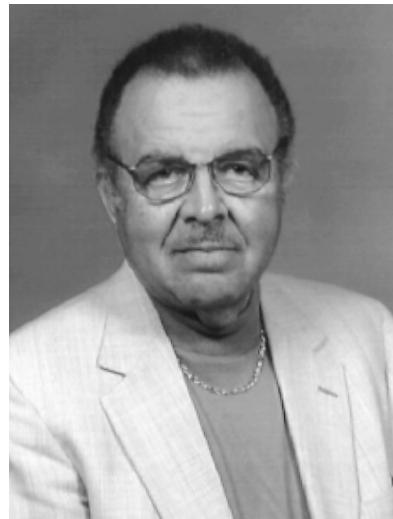

Oh very much so, very unpredictable. There was never any thought in my mind. That was never a goal for me, to be a business owner.

What do you think has been your most valuable asset, that allowed you to sustain yourself as a viable business person?

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with Luther T. Prince in Minneapolis, Minnesota, 18 October 1996.

That's a good question. I have the ability to persuade people to help me do things. I don't have a lot of skills, but I have a lot of knowledge and I'm able to persuade people to help me out. Let me give you an example. My company needed money; I knew we needed money, but I didn't know how much. I went to a friend who was on the Urban League board with me and just asked him a question, "Do you know where I could possibly raise some money for my company?" He said, "Let me take care of it." He called Boston—there was a venture capital company in Boston. He told them that he wanted them to invest. He was one of the principals in that company. He told me he wanted them to invest in my company.

First thing he had to do was check to see, "Well, did he really go to MIT?" So the guy got in his car and drove over to MIT and found out,

“Yes, he really did graduate.” Then he came to see me and we verbally did a business plan. He said, “Well, how much money do you think you need?” I said, “I think I need \$100,000.” He said, “Oh, you need more than that, you need at least \$250,000. I’m going to find somebody else to come in with us and get you the \$250,000.” And he did. That took about four hours.

Did he say what he liked about what you presented to him?

No. I think I know what it was, even though we never talked about it. I think it was the fact that I was a minority businessman and I had the qualifications, at least the technical qualifications. I didn’t have the managerial qualifications. But I was a qualified person and a minority. I think that had some appeal. It’s a nice, warm, fuzzy feeling to invest in a minority company. I think that’s what it was.

Now, was this a minority investment company?

No, ninety-eight percent of the employees were white.

This was when?

Well, actually it was in the 1960s—1968, ’69. I think Nixon was president. I remember talking about black capitalism. I think that’s right.

I remember reading something about the fact that once you took the company, a predominantly white company, you eventually were able to recruit two key black vice presidents for your company. Is that not correct?

Actually, I had three—an operations manager; I had Bill Ramsey, who was vice-president of research; I had a guy named Carlos Montague, who was the controller and treasurer of the company. There were no blacks there in the first place. What they now had was white employees and black managers.

That was unheard of.

Yes.

Did you see any problems that arose because of that kind of a managerial setup?

There were a few problems when I first took over. People wondered, “What’s he going to do with the company?” When they saw that everybody would be treated fairly, they all relaxed and went back to work. I don’t recall any incident or any instance that happened that related to what you’re talking about. In fact, we had a black fore-

man who really had a lot of indiscretions, but the white employees loved him. They backed him and supported him when I wanted to discipline him. “He’s the best one we got,” they said.

That’s interesting. You mentioned the ability you had to persuade people to actually do something you wanted done. There was a point, in fact, where your company needed to really produce way beyond the productive layout that you needed and you persuaded the employees to actually put in a little bit more time.

Actually, I didn’t. They did it with less time. The first thing I did was I fired a guy who was the wrong stuff. That made me a hero. Then I put the responsibility on them. I said, “These are our goals. If each of you can identify what part of these goals you can meet...” And they rallied behind that. The reason I say it took less time is that I told them if they met the goal by Thanksgiving, I’d give them a day off after Thanksgiving. They did it before Thanksgiving and there wasn’t overtime in the log.

That was one of my biggest thrills, to see those people change what they had been doing for months. Overnight, in one month’s time, they switched and became real champions.

It’s interesting because these kinds of skills that I hear you talking about had to come from somewhere other than MIT.

They did. You don’t get that at MIT.

Do you have any sense about where your ability came from, to be able to get people to really produce the way your employees have?

I haven’t the foggiest idea. If there’s anything I can point to, my philosophy has always been to expect the best of people, treat them fair, and—above all—be straightforward with them, don’t lie to them, don’t manipulate them. A lot of people just really respond to that. I tried to keep them informed about how things were going and their role in things. But I can’t point to anything. I had no experience at that before. I don’t know how it happened.

Let me ask, then, because quite frequently you have to look at where a person grew up: family. Could you talk a little bit about your family, where you grew up, and some of the highlights of your early education before you decided to come to a place like MIT?

Well, first of all, I was born in Texas in a small town called Cleburne. I went to school primarily

in Fort Worth. At that time, the schools were all segregated. This was before desegregation, so I went to an all-black school. It wasn't anything to brag about, particularly our education, but there was one thing that stands out in my mind. For some reason, they instilled in us that we were somebody and so we just automatically assumed we were going to college. It was just sort of a given. We didn't know where. In fact, I never thought about college until after I finished high school. I finished at a fairly early age. I was fifteen when I finished.

Why so early?

It was only eleven grades, first of all. Secondly, I started early. I was younger than the other kids. But I wasn't the only one to graduate at fifteen. There were about two or three others in my class. You weren't a real prodigy.

Anyway, at that time I was fascinated with aviation. I loved airplanes. I wanted to do something in the aviation industry. At that time, I had heard about the Tuskegee Air Force Base. I mistakenly thought that was associated with Tuskegee Institute, which it isn't.

So I decided to go to Tuskegee. You didn't have to register until you got there. There was a big, long line and everybody was waiting to register. I walked up to the front when it finally got to be my turn. She said, "What do you want to take?" I said, "Flying." She said, "Flying? We don't have any course in flying." I was stunned. Here I had come all this distance. She said, "Well, hurry up and make up your mind. See all these people behind you there?" I said, "Well, what's the closest thing you've got to flying?" She said, "Well, we've got aircraft mechanics." I said, "Okay, sign me up."

So I signed up for a course in aircraft mechanics. While I was there, I met two of my instructors who introduced me to the notion of engineering. I had never heard of an engineer; I didn't even know what they were. I said, "Well, where do you go to school to be an engineer?" They mentioned a lot of schools and then they said, "MIT is the best." So another guy and I wrote to MIT and got a catalogue. We saw the tuition and just thought, "Oh, my God." But we were hooked. So I decided to try someplace else, an engineering school.

We wrote to Ohio State University, applied there, and got accepted. There were three of us. The three of us were at Tuskegee and we wanted something better than Tuskegee offered, so the three of us ended up at Ohio State. But I still had it in the back of my mind, "Boy, wouldn't it be nice to go to MIT some day?" I stayed at Ohio State for a while. I started out in aircraft mechanics, aeronautical engineering, and in my second year I concluded that that wasn't for me. I thought as an aeronautical engineer you designed airplanes. I didn't know that you would design a wing or a tail. So I switched to electrical engineering. Then I got drafted. I stayed in the Army for twenty-eight months, and when I got out I made a beeline for MIT. I had the GI Bill.

So money was not as much of an issue at that time.

Well, fortunately, because of the GI Bill. Otherwise, no way could I have even thought about it. So that's the long way to tell you how I got to MIT.

And your early impressions of MIT, you're talking about what year approximately?

1949, either '49 or '50.

What was it like during that period of time that you remember, in terms of highlights? If you had to talk about it and give highlights, what was it like being at MIT during that period?

Well, it was a little bit intimidating because there were so few blacks around. The one or two blacks I met that summer were Victor Yancey and Herb Hardy.

I interviewed Victor Ransom.

That's not him. Victor Yancey was a year ahead of me. He graduated in '50. Anyway, when I first came up I lived in the dorms. It was uncomfortable for me because I didn't know anybody and I'm suspicious of people. I did find one guy who was a genuinely caring guy, but I found the professors, as far as I was concerned, unapproachable. They were just up on a mountaintop.

At their mercy, right?

Yes. The first summer was tough. I had difficulty studying, learning how to study. There wasn't anybody to help me there. So that first year, that first summer was very uncomfortable. First of all, as far as I'm concerned, the professors never did any-

thing and through the years I perceived them as still the same way. The whole place is cold.

That's the way you have seen it, even over this period of time?

Yes. The social life at MIT was just nonexistent, so I reached out to the community. Victor Yancey left and I used to go over to his house on Friday for franks and beans. Is there an Everett in Massachusetts?

Yes.

That's where he lived. That's where Victor lived.

It wasn't a joyous experience, let's put it that way. There were very few blacks. Even ahead in my sophomore year and junior year, there were very few blacks on campus and none in my class. We couldn't study together. When you saw each other, you were always in a hurry. There was a guy named Jim Montgomery. I don't know whether Herb Hardy finished MIT or not. He was a physics major.

Were there any professors who stood out in your mind in any way?

Not in any complimentary way. I had one guy who talked to the blackboard all the time. He was a math teacher, a pretty famous guy. He would come in and the first thing he would do was turn his back to the class and start writing and talking. We could have all left and he wouldn't have cared. It wouldn't have made a bit of difference. I found my thesis advisor when I was in grad school was a warm guy, but just too busy to give me much time. I didn't feel uncomfortable around him at all. He was Tom Jones.

Oh yes, Tom Jones. He came back to be a vice president. He left and went to some other school? He headed some little school?

The University of South Carolina.
Okay, not exactly a little school.

No. In fact, he's considered to be a mentor of Paul Gray.
Oh, is he? I'll be darned. Paul Gray was in electrical engineering, wasn't he?

Yes, he was. In fact, he may have been in school about the time you were there.

Paul claims to have seen me when he was working in the stacks in the library—"Oh yes, I remember you. I was working in the stacks."

I told him I was going to be talking to you. In fact, I talked to him last night. He remembers you.

It couldn't have been too easy, particularly with virtually none of you on campus. I mean, you're talking about less than ten people, possibly.

Yes, that's about it.

Did they have the concept of a lot of studying in groups and all that? I'm sure that was the case then, right?

That may be the case, but it never did affect us. Maybe the frat houses did that kind of stuff, but we were alone—by the hour, just grinding away.

I suspect that when you think about it, it doesn't bring back the most positive memories. It sounds like there wasn't a lot of support.

Quite frankly, I don't have any positive memories of MIT. I was glad to get the hell out of there. I turned my back on that school for like twenty-five years before I even came back for any reason. I just wanted to get away from that place.

Didn't the Institute try to get you back after a certain point, particularly when you became noticeable out in the community?

Well, I actually came back and served on the visiting committee of the electrical engineering department. I stayed on that committee a year or two and then I just left. I just decided, "Oh, to hell with it." That was a bunch of cold guys. That turned me off. They all knew each other. When we'd get together, they were all huddled up talking, yakking, and I was looking for a friendly face.

And you said you didn't have to put up with that. Well, I tell you, that department is the largest department and has been for years. There's still the kind of stories you're talking about that come out of there. A young man I knew just took a certain slant to get through, but he finished Course VI. It will be good for him to hear you, you and he talking about the department. Here's a man who finished in 1991 and here you finished, when?
Forty years before that.

Yes. I'm telling you, the similarities of your experiences—at least that's what I hear. That's a message, it seems to me, of some sort for the young Luthers and the young Roberts who are coming, to understand that if they're going to come there, look, if it hasn't changed in forty years, what makes you think we're going to have any change ahead, you know what I mean?

Yes, good point.

What we're talking about—whether you want to admit it or not, when I look at how you got there, who you are, all of you—we're talking about the best we've got. That's what we have, the best we've got. And we are still bringing the best we've got. In fact, the numbers have gone up.

Have they?

Yes, instead of bringing, say, five a year or three, we average on the whole now a good seventy black males and females—outstanding people. It is different from when you and Jim were in school. The country is so computerized, as you well know, that there is not a kid who could be outstanding—certainly not a black kid, no matter what part of the country he or she is from; they can be from a small town in North Carolina, about as big as this room—who will not be identified by the time he or she gets to be in the eleventh grade. We know who they are. Harvard knows who they are. So there is not even a guess any more. We send them literature by the time they get to the eleventh grade. We know about them; we're going to send them information. And we know those we don't want to send any information to. I'll be darned. Really?

Oh, yes. And so therefore, when we see the seventy kids who come in that door now—same door you came through—they are the best that we have produced in this country. They're the best. We still have an attrition rate, but a graduation rate now of about seventy-two percent over a five-year period.

For blacks?

Yes. Now, that's one of the best in the country, but still if we lose close to thirty percent most of it has nothing to do with color, because they're the best we've got. The biggest problem, I think, my personal view after twenty-four years around that place, is that they did not get an understanding of what you know now and what Robert knows now. Forty years difference, and I think we need to do something about that. That's our responsibility. We may not be able to stop them and say "Go to this place, go do that," but it is our responsibility that they find a place. And that's what I think this is all about—trying to get something we can sort of gear the knowledge to, because somebody put their time in to make you what you are. But we can identify them, that's the point, and they really are very outstanding. The numbers are increasing and we are bringing them in.

We still don't have very many black faculty members. We only have about fourteen. We did have in the mid-'80s about twenty-four or twenty-five. There are

still departments that have never had a black professor. There are still departments—even physics, where Jim works at the present time—where out of maybe a hundred and fifty faculty members, we only have one. So we still have made no headway there.

When you look back now on doing some things that very few of us have done in terms of business, if you had a chance to advise the young potential engineer coming to a place like an MIT—a black woman or a black man coming and you're looking down the road even beyond MIT as to where he or she could be—what advice would you give them?

Well, I think some of the best credentials for people in business is an engineering degree or an MBA. I would encourage them to do that. And you don't have to just give up other things—you can do that in the evenings. I would strongly recommend that. As I mentioned to you, I had no thought about that. In fact, one of the problems I had when I came into business was that I had no background, no academic training. I didn't know how to read a financial statement. I didn't know what marketing was. I had none of those skills. The only thing I brought with me was the fact that I had been a supervisor at Honeywell. I had supervised some research engineers. But nothing prepared me. It was just a fluke that I got into this company in the first place.

So that would be my thought—to get a business degree, an MBA on top of your engineering degree. That's a powerful combination.

That's very helpful. What are you doing now?

Well, I'm retired. After I left Ault, I just went into semi-retirement. I tried that, but that didn't work at all, the semi-retirement. So then I went to work for the state as an assistant commissioner in the Department of Labor and Industry, where I got caught up in the problems of the inner city. So right now I am working on economic development in the inner city, trying to bring businesses back into distressed areas. I'm working on an incubator, a business incubator. It cost about a million bucks to get it up and running. I hope to have it operative. What it will do is help develop food entrepreneurs. It's called a kitchen incubator. That's what we call it.

I'm also working on inner city industrial park development. In fact, I was doing that last night. But that's very frustrating, dealing with citizens or residents of a neighborhood. They just

want what they want, but they don't want to pay a price. They don't want to give up anything to get it. But it's interesting. I've been doing this for two and a half years now.

I also have a non-profit company. What it is doing is trying to persuade large corporations to off-load some of their products that don't quite meet their criteria any more. For example, suppose a company says, "If we're going to keep something in production, it's got to be a fifty million dollar deal, and it's only five." So I'll say, "Why don't you give that to the non-profit and we will put together a company that will do that five million for you?" That will be a hell of a lot of business, a five million dollar business. So I'm working on it. I haven't been successful yet; I'm working on it. I'm working on it primarily with 3M, to try to get them because they've got all kinds of products. What I want is to find a product, something that doesn't measure up to their goals of the fifty million or a hundred million. It's a lousy million or five million, something like that, and get them to off-load that. That's what that organization does.

Then I'm a business development director for another organization called Urban Ventures. That's where I'm working on the incubator and also the industrial park. I don't work full-time now. I give them three days a week and take two for myself.

Well, you certainly deserve it. It sounds like you're doing some fantastic things.

It's interesting. One of the things that I always felt bad about, when I took over that company called Ault, was that I never was able to get significant numbers of black workers. I finally got them into top management, but I tried everything I could think of—busing and driving and loaning them money to get cars and so forth. So that's still a void in my life. I want to do that here, right in the inner city.

Well, it's very clear. I think in the article I read about your company—you know, when you took over—was that same point that I think you made then. You said that you had not been able to get as many blacks as you had hoped to get into your company.

It was in the suburbs.

Yes. Does Randall Bradley know about what you're doing?

I don't know him.

Randall Bradley is MIT class of '74. He's an architect. He and his wife are working out of their house, doing architectural work and very much interested in doing things in the urban community. I want to make sure the two of you meet. Just the idea of what you're doing is major, but he also is interested in the urban community and is committing his time and effort in there in a different way. So I think that that would be very useful.

Yes. About how many MIT'ers are around here, in the Minneapolis area?

I don't know exactly, but I know we have at least fifteen to sixteen.

Great. There's an MIT club in town. I went to a couple of meetings, but I felt I was back at MIT.

But you know what? I'm telling you, that's the same thing that several of the guys had said to me this morning. They sense the same thing you sense. The consistency of what you feel about it is amazing. You're not alone.

This has to do with the story of how I moved into a small company. I was working at Honeywell and doing as well as I should have been doing. I had gotten some promotions, was doing well and in an area I liked. My boss's boss came by one day and said, "Lu"—that's what they called me—"what do you want to be doing five years from now?" I said, "I'm not sure, but I'll think about it and when I see you again, I'll tell you." I promptly forgot. A couple of weeks later he came by again. "Well, what did you decide?" "Oh I'm sorry, I forgot all about that. I promise you, I will definitely have an answer for you next time."

Well, he never came back, but the seed was planted. So what I did was I started looking. The way the organization was laid out was that my boss was in an office there and I could see where his boss was and the other bosses, and then I could mentally see where the head of engineering was. I looked at all those jobs and figured how long it would take me to get through each of them. I concluded that I didn't like what I saw. So I said, "Oh, I know. Maybe I stopped too low. Maybe I should go to the vice president of engineering of the corporation." So I called him on the phone and said, "May I come and see you?" He said, "Sure." So I went up to corporate headquarters, which is about ten miles away, and I said, "What do you do here?" He took fifteen minutes and explained to me what he did, but when you boiled it down—nothing. He supervised seven

very old engineers who were in a research lab that they didn't know what to do with.

So there I was. I was crushed. This was the vice president of engineering and I didn't like that. So I said, "What am I going to do with my life? All I am is an engineer. What else is there?" So that started me thinking, what do people do besides engineering? I discovered there was another world out there. Some circumstances happened and I ended up in a small company, without planning to.

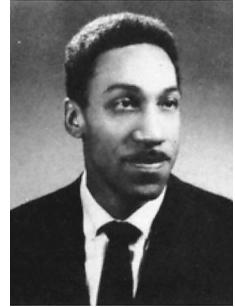

Well, it's an excellent story. It really is worth repeating. I'm telling you, I just had a story very similar to that, where a young man got his Ph.D. from MIT, just this past summer. He is a student from Nigeria, very bright. My wife and I were his host parents while he was here. He finished his Ph.D. in Course VI. He hit the ceiling in terms of achievement. They wanted him to be a professor. He had helped to develop a motor for Ford Motor Company that would be based on electrical fusion or whatever, and Ford Motor Company wanted him to come to Detroit. He looked at the organizational chart. They were offering him a position down here, and he saw all this mess up here.

Then second, MIT wanted him to be a professor. When he looked at how much they were going to pay him as an assistant professor, he thought again. He had a friend he met as he was going through the graduate program and who finished before he did, and this guy is on Wall Street. He wants him to come, and within five years he'll be making over five hundred thousand dollars. He asked me what he should do. He said, "Dr. Williams, I just have to try that because that's a lot of money. Based on what they're telling me I will do in these two jobs, it doesn't make sense." I don't see that scenario any different from what you just described. I'm telling you, more and more are able to see that picture as they're getting ready to come out of school. That's the best time.

That's where I think you come in, the many good people out here. I think that many of them have this sense that they want to be an engineer, but then they go out and do these summer jobs and they do these internships and so forth, and when they come back, even though their minds are set that they're supposed to be engineers, they don't like it. I think we've got some very good people out there. They just need some reassurance sometimes.

WILLIAM B. STEWART

BA 1952 (mathematics) Ripon College, BArch 1955 (architecture) MIT; worked as a draftsman and designer in both public and private ventures, 1955-1969; executive director, St. Paul (Minn.) Model Cities Program, 1969-1971; Model Inner City Community Organization (MICCO), Washington, DC, 1971-1973; director, Minority Student Program (MSP), University of Minnesota, Morris, 1973- ; taught at University of Wisconsin, River Falls, and University of Minnesota, Morris; recipient, President Appreciation Award, Association of Minnesota Black Counselors and Directors of Minority Programs, 1975-1977.

I came from a family of five children—four girls and I was the only boy. My father died when I was eight months old. My mother really reared that family. We lived in Detroit, Michigan, at that time in mixed neighborhoods until the time I went into the service. We lived in Hamtramck, Michigan, which was the Polish neighborhood near the railroad tracks. I later went to elementary schools in Highland Park, which is an Italian neighborhood. For junior and senior high, I went to another part of Detroit that was Jewish.

So most of my experience was in a mixed school that had a black population, but it was not totally black. In many respects, I think that sort of saved me because the schools were good until the community all turned black, and then it changed considerably. I went to an all-city technical high school and that sort of gave me a base for being prepared in the areas that I would need if I decided I wanted to go to a school like MIT.

Now in society at that time, there was no encouragement at all for blacks either in the high schools or junior highs to go to college. That had to be thought about on your own. I thought about that from the time I was ten years old, that I was going to go to college. I lived in Detroit, Michigan, the automobile capital of the world. The factory odors made me sick. You could feel them out there. So I was determined very young. My father had died, my mother was on social security and she had to work. I decided early that I would get out of that situation somehow.

So that came at a very young age. Most of my youth was spent in an extended family. My uncles

always helped provide for me. I had a friend whose father would take me in on the weekend with his only son, so that they made sure I had some kind of dimension with a male figure. I went through in the early '40s a riot in Detroit, June 1943. There was a race riot in Detroit just before World War II, and I experienced that kind of behavior. It was before that major one in 1967 when they burned Detroit, but I went through that as a youth. That was a traumatic experience. Then to have to go into the service with that behind you was a very shocking experience.

I grew up in a situation where I really never understood my identity, and there always was an ambivalence about who I was and what I had to do—then to get into a society where it seemed as though there were no opportunities in the area that I wanted to get into. I knew I liked art. I liked

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with William B. Stewart in Morris, Minnesota, 19 October 1996.

to write poetry. I liked to do other things. Now where my insights came is when I went to this junior high school, where there was a Jewish student who at that age of fourteen or fifteen was doing magnificent drawings. His name was Solomon. He became a noted architect in Detroit later on. I looked at those things and I said, "Oh, wow." I thought that maybe this is what I wanted because I couldn't make money as an artist. So I wanted to get into architecture. There was no place anywhere for any of us to do that. In fact, when I went into the service they laughed at me. The black brothers laughed at me, talking about how I'd never make it.

Did they see any of your work?

Not after that. No, the only example was to draw elevations for a latrine—outhouse—to be screened on all sides. It was on the Palau Islands, on one island—Peleliu. The commander had the men construct it. But before, that's what they said, "You'll never make it, you will never make it. No one will ever hire you." I said to myself, "If I live, I'm going to try."

What year was that, approximately?

Late 1945 into 1946. We were in the segregated Navy. Opportunities were extremely limited. The only thing you could do was be a cook. You have to understand, I took the alpha-beta tests and did very well. They told me in school that I did not belong in cooking and baking school. That was near Rochester, New York. They told me that my scores on the Army and Navy alpha and beta tests were such that I had no business being there. But I couldn't get out of it.

I went through a period somewhat of depression, but not totally. My commanding officer at the air station at Squantum in Massachusetts approved of my taking the test for carpenter's mate 2nd class. I passed it and was promoted to 2nd class petty officer in that area. I was released from cooking and transferred to Camp Perry, Virginia. I was trained in the Navy's new logistics support outfit to go in behind the Marines in battle and secure a base to build Quonset huts and act as a port outfit to unload supplies.

Tell us how you actually got out of that situation from high school up to even getting to MIT, even finding out about a place like MIT.

I was in the United States Navy, had taken these batteries of tests, and they sent me down to Massa-

chusetts. I had just gotten out of cooks' and bakers' schools on my way going overseas. I had read about MIT. My physics instructor told me in high school, at Cass Technical High School—"MIT is such a difficult place. MIT kills students. The tests are so hard they give you three-hour tests and they don't even worry about sitting you apart." I said to myself, "That may be true, but I'm going to try."

That's how MIT got planted in my mind. When I was in the Navy in Massachusetts at Squantum Naval Air Station, I put on my blue uniform, I went down to MIT, talked to the director of admissions, and told him I wanted to go there if I lived to get out of the Navy. He said, "Son, let's see if we can try."

Was the director white?

Yes, he was.

I know he had to be.

He was white.

Was that teacher who told you this white?

That's exactly right.

He didn't think you could go there.

He just stared at me. He didn't believe that. Now look, I knew nothing about MIT. He mentioned it to the class. I asked him about it and he told me, "Mr. Stewart, you do indicate a semblance of intelligence, but MIT is too hard." I said to myself, "Yes, but why not?"

Then on the basis of that, when I got in the service and I was down at the Squantum Naval Air Station, I was in the Boston vicinity and I used to try to go to school part time if permissible. Otherwise, I always had books to read and stuff like that. I belonged to a book club. I just read. I did that. That was my nature, to continue to learn all I could in preparation for college after the war was over.

When were you in the Navy?

In the Navy, from 1943 to 1947, I read. I went to Boston when I was on leave one day. I heard about the school, went down there, picked up a catalogue, and came back to the base. That was the day I decided I was going to go and see the director of admissions.

When you went to MIT that first time to see about the possibility of applying, what was your impression of the place?

I thought it was a massive place—large, because of the major buildings. I remember I had to catch the

street car and such. I walked out and saw that big ancient building, and then you get in and the ceilings are high and I didn't know which way to go. But I had called him and he told me where to go, so I came. He even impressed me that much more, in a way that I would have to thank him because I didn't sense any negative behavior like that I had encountered before. He was receptive at that point. He encouraged me and that made me feel as though it was possible to attend MIT.

Then the thing I did was I went back and I got shipped out overseas and I kept the information. I kept reading, and then when I came home and got out of the service I started looking for work. I had my mother, and I was going to help the family and prepare for college. I worked for two or three years. I worked for three years in a factory at Chrysler Motors.

Before you actually applied?

That's right, and then I applied. I applied after I went to Wayne State University for six months, and after I went back to Cass Tech High evening school. I had finished high school, but I wanted to go back to evening school again to see if I could reorient myself. And then I started Wayne State University.

Is that when you were saying that while you were working in the factory you would actually take your books?
I worked forty hours a week and went to evening school from 6 to 10, four nights a week.

You would actually go while you were working.

I'd take my books to the factory, wrap them up so they couldn't see them, then get on the assembly line. I had a concealed place to study. A friend and I worked together. I'd catch up and go back and look at my book while he held the line for a short time, sneak it so they wouldn't see me. I also learned vocabulary by taping *Reader's Digest* list of words to my machines. But they found out later. A foreman in the last job in shipping autos overseas wished me well.

The desire was that strong. I applied to MIT. I took the entrance exam. I didn't pass it and I felt even more dejected, because I was denied entrance to MIT. Then I had another black friend by the name of Bill, and I forget his last name. He was from Mississippi and going down to Hampton Institute in Virginia to work on his master's degree in agriculture. We had developed a friendship. He told me, "Look, don't be so dejected. I'm on my

way down to Hampton." He looked up these twelve colleges that had an association with MIT on the 3-2 plan, and he wrote all twelve of them.

I got into Ripon College in Wisconsin. My mother had died, so it was really kind of luck to be accepted. I had a choice to make, and so I left. I told my sister I wanted to help her and the family. She said, "No, we will survive. You know what you need." I got in mid-semester. Ripon, I think, was a very good college and had suspended unsuccessful students. Therefore, I and others were admitted and accepted on probation.

And you went how many years there?

Three and a half, and then I graduated with a degree in math and a minor in physics.

You still didn't forget about MIT, though.

No. Well, the next step was to try to get into MIT through that 3-2 plan—I and two other people, two other white fellows. All three of us were successful in getting in. In fact, the other two were in the Sloan School of Management.

This was the graduate program?

Undergraduate.

So you had to go to that school first and then come to MIT as an undergraduate student. You actually did a double take.

Exactly, but I didn't have to take all of those first courses. I had had all the math and physics requirements completed. Therefore, I immediately went into the School of Architecture.

What was the experience like?

Well, it was very different in this sense. I didn't see anybody like me. I did not have a black friend as I had at the other school. We were the first two blacks to graduate in 125 years at Ripon College in Ripon, Wisconsin. I mean, in a smaller college at least you had to a degree some kind of support system from whites—and one black male Navy veteran, Delroy Cornick—whom you would talk to. But I had no support system at MIT. Delroy received his Ph.D. in business economics from the University of California and was head of the business economics department at Morgan State University. He just retired and still teaches part time in the graduate school there.

How about the architecture department at MIT?

The architecture department itself was small and our relationships with some of the professors were

good. They would work with you and the students. But insofar as the support system, the social and psychological, there was none of that.

What are some of the highlights of that experience at MIT?

First of all, let me talk about the personal and social psychological thing. I did have friends who were going to Boston University who were working on their master's and Ph.D.'s. James Marquiz, who received his master's degree and Ph.D. at Iowa State University, was a major support for my success at MIT, psychologically. He is now retired after teaching music at both South Carolina State College and Albany State College. In fact, Martin Luther King was working on his Ph.D. at Boston University while I was at MIT. And Howard Thurman—black theologian, author, and great churchman—was there at that time in Marsh Chapel. Then I knew people in the community. I did have a family I knew from the Navy. I did have to a degree some kind of life outside of working all day and all night and all weekend at MIT. That helped me survive in the lower points when things weren't going well. At least I could go and talk to these people and have some response and encouragement.

But my life inside MIT, as far as the students were concerned, I think the informal part of the education was somewhat good in the sense that I was on the student staff and I worked in the dorms, cleaning the dorms and so forth. I got to know a number of students in engineering as well as other students outside of the architecture discipline. That allowed me to develop those kinds of informal relationships, so that I wouldn't feel totally isolated. I played intramural sports and that kind of thing. But insofar as studying stuff was concerned, there were no types of group study things where we sat down together except through architecture and planning. So if there were any problems, I had to just work them out for myself. I couldn't go to someone for academic assisting. I couldn't go to someone for support. There were only one or two professors in architecture who really worked with me. Insofar as things like civil engineering and all of this, I had to do it all on my own. That doesn't provide an academic support system of what I would call study groups together where you could overcome problems.

That's one of the more difficult parts. I had no way to work out those kinds of things except

through class and maybe through one or two professors, but principally in the architectural area. Then the most disturbing part, there were no internships. I'm in a field that I feel I'm not even sure I'm going to get employed, and here I am working with the hope that times were going to change and that I would find a position.

You had gone through all of this experience realizing that, "Sure, I'm doing all this, but I won't even be able to get a job."

I didn't even know. In engineering there may have been an internship, which in a sense you always had to question whether they would accept you because you were black. But there were none in architecture.

This was the '50s?

The '50s, 1952–1955. That McCarthy anti-Communist Congressional investigation was going on at that time. Prejudice, discrimination was open all over—even in the factory. When I came back to Detroit for summer work in the factory, they had a list. They looked down this thing, and I could see that I wouldn't get a job for the summer because I was not on the list. I had to work as an orderly in the United States Marine Hospital.

What was it like at MIT? What were the things that you felt were just openly racist when you look back at it now?

Oh, the attitudes of people in general and some attitudes of your instructor. He would indicate if I had a tough day, "I don't understand—can't you do this?" In fact, one instructor talked to me about another black student and why wasn't he in class. But you'd get the attitude—a few of them, not all of them.

There were some very good instructors there. The ones I found who were the most sensitive were the ones who by far, in effect, were the most intelligent and sensitive to my plight as a minority black student. This applied to teaching even in the art and the engineering area, which we were required to coordinate in architecture. A lot of that stuff involved both the liberal arts and technical thoughts. MIT was going through a stage at that time of attempting to develop a liberal arts curriculum along with the technical curriculum. In that kind of a sphere, it was important that I came out of a liberal arts institution along with other persons who transferred there. I could then cope in a way with the affected thinking to a degree,

because you had highly selective technical scientific thinkers who may even embody some of the same theories about technology.

In certain classes you would experience the arrogance of students, which seemed a subtle MIT trait. But on the positive side, there were some instructors who did work with you and try to help you, but they were few and far between.

What would you say was best about your experience at MIT and what would you say was worst?

I would say the best experience is you're in a competitive kind of environment, whereby the work that you see done is the best you're going to find anywhere else, I think. You're working with students like DuPont's son and other prominent people's sons, so the work that you have to perform has to come to a standard. That I would call some of my best experiences, in the sense that when you develop a project you know that that project has to be up to a certain standard of excellence.

There were a few students who would offer help on projects. There were also a few professors who worked at helping you. Even doing my thesis there was one. He took me through a whole setting of my thesis site and photographed it. That was the best part.

Who was he?

Professor Tom McNulty. I don't know if he's still there. Then I had a couple of student friends, one from New York and another from New Mexico. We were very good friends. We'd talk about architecture. We'd talk about the theory. We'd talk about the philosophy.

These were white students, right?

That's right—Tad Hoshour from New Mexico, Leo Leoni from New York, and some others including Bob Dyck, who is now a professor of urban planning at Virginia Tech in Blacksburg, Virginia. We'd ride our bikes and then we'd talk. That informal education was an important part of it. For example, there was also a black graphic designer from Cleveland, Ohio—Mel Nickerson—who was doing work with Dr. Kepes in graphic design. I worked with Mel. We used to stay up nights and he'd talk about drawing, painting, sculpture, and things of that sort. That helped. That was the rich part of informal education.

Then I knew my friends at Boston University. We'd meet on a Sunday and we'd walk around the city. And Dr. Thurman was there at the

church. That atmosphere was expansive, and we'd also go up to Harvard. That atmosphere, the philosophical base, the rigor of the program that people could talk to you about, and then you'd see them do their work, that's what I enjoyed more than anything else—even though there were no blacks. The only black undergraduate student I knew at MIT was Reginald Griffith. There were two black graduate students, one in electrical engineering and another in mechanical engineering. I also understood that the husband of Dr. Josie Johnson, regent of the University of Minnesota, was there in graduate school. I did not know he was there, as he may have lived off campus.

What about the worst part of your experience there?

The worst, I think, is the fact that there was no psycho-support system when there were down periods. There were no faculty whom I could relate to. I knew nothing about black history. I had no role models. I had nothing to work with. I had nothing to drive toward. It's only after I got out that I began to really read and know about blacks, not only in engineering but blacks in history. I was going through a stage of personality development and mine didn't crystallize until I really began to question what happened and who I am.

Then the long hours of work. I wouldn't call that bad, but then the fact that there was no social life within the institution. There were no comrades within the institution whom I could talk to about, for instance, the things that we have here. If we had had enough people to just get together, even if there were no faculty and staff, at least we as students could have gotten together to begin to discuss things. But all I saw was a white sea of faces no matter where I went. That was the worst, most difficult part of MIT.

Just a subtle impropriety. I mean, one day I went down the hall with a female student—we had a white design girl in architecture—and everyone just turned around to watch me as if something was wrong. Going down the hall, I couldn't understand it. We were just classmates. There was no personal relationship.

Norbert Wiener, who developed the science of cybernetics—at that time my wife was my girlfriend from Boston University—came over to eat. My wife was sitting there with me and Tad Hoshour, a white student. Norbert Wiener had a thing of not looking at anybody because his mind was concentrated in “outer space,” but he looked

over to that table and saw her. My first reaction was, “Here is this man, a genius in his time, but he has to look over and see her.” Now I don’t know whether he thought that she was a student there, because she was working in one of the MIT labs at that time, or whether he really saw her as a black woman in a situation that he couldn’t fathom.

But that’s true. I can attest to it. He’d lose his car in places and forget where he parked, but he could see that day. So I’m saying the atmosphere was congenial yet hostile.

You finished MIT in '55?

Yes.

What happened? What did you decide to do? How did you get to the next step beyond, once you got that training and finally finished in '55?

Believe me, I was scared to death because I had no job offers. Luckily, what happened—and I had talked with people about that—is that Thorshov & Cerny had one of their partners there, chief designer John Rama, who had finished his master’s in architecture. They were looking for people to employ. Two other white students, Gene Peterson and Dwight Churchill, and I applied. They hired all of us to come to Minneapolis–St. Paul.

I said, “Where should I go work? Do I have a chance?” And the professor said, “Well, there’s nothing in Detroit that I know of.” They weren’t employing us at all at that time. He said, “Maybe you should go to New York, but if you get an offer in Minneapolis, take it. Architecture is opening up in that area.” That’s how I got my first position.

Here in Minneapolis.

I came down here to Thorshov & Cerny, and Cerny was a professor at the university in architecture. John Rama was their chief designer. He hired me and Gene Peterson and Dwight Churchill at the same time. They needed people who were just starting at that point. That’s how I got here. When I got here, I had no place to stay.

Talk a little bit about that. In other words, you got a job that was offered to you in Minnesota?

Well, not from a firm. Professor Cerny had a firm on the side. Thorshov & Cerny was the largest firm in the area. I came just as we got married. I had not been there before. I didn’t know what they were going to do for me once they saw me. I was supposed to get married and I came up to Minnesota two weeks ahead of time to find a place

to stay. My wife, Ida Wilcox, now Ida B. Stewart, was a student at Boston University and had just been accepted at Hamline University as a student.

I came up to look for a place and I never encountered so much discrimination in my life. Gene was my white friend. I went over to Hamline, they didn’t have anything. There was no housing available around in the Twin Cities at all. I went to Billy Graham Bible College at that time and went into a private apartment residence. A family was sitting down on a Sunday morning. The man looked up and saw me and said, “Nigger, no apartment is available.” His five-year-old son looked down at his breakfast on the table in embarrassment as his father pointed me out as “the nigger.”

This was on Billy Graham’s campus?

That was around the campus where Northwest Bible College was, and there was some private housing and apartments around there. I just answered an ad and went to it. I’m sure students were renting from those private apartments and homes.

Hamline University was another one. I couldn’t get anything there because the dean of students said that my wife had to be a GI to get into the government barrack housing. I couldn’t understand that. I did finally get a private place. When the fellow saw who I was, he said I couldn’t have it, that someone else had taken it already. I took my white friend Gene Peterson to test his claim, and he rented the place. We then went to the NAACP to contest it. The owner said we had to share a bathroom with other tenants, and I said, “No, I’m not going to take it.”

So I wound up finding a black lieutenant colonel who was in the Army, a supply officer in North Dakota, South Dakota, and Minnesota. I was going to live in the YMCA and my wife was going to live in the YWCA. He then got us a hotel room where he lived, and that’s where we first started out. I even took the supervisor of the architectural firm to help me look for a private place in downtown Minneapolis. That didn’t do anything.

How did you get to your present job? You spent a number of years down at the University of Minnesota at Morris?

The thing that happened to me, I worked for two or three firms. My wife, by being a teacher, was very active in the St. Paul black community and at

that time the Summit University area in St. Paul was going through renewal. They later received a Model Cities grant. Renewal is physical planning, but Model Cities was economic and social and physical planning. They needed our work in physical planning, which revolved around architecture at that time. They needed someone who could set up a community organization, to work with the urban renewal system and set up this Model Cities process. At that time, in the urban renewal agency they were looking for people and they thought that I would be a good director.

So that's how I started and got into urban renewal. I was the director of the Summit University community organization in that thousand-acre area—twenty-five thousand people—and started the renewal process. By the time it got into Model Cities, then I was selected by the citizens of St. Paul—with approval by the mayor—to become the St. Paul Model Cities director.

I stayed in that position for three years. Then I went to Washington, DC. I was the director of the Model Inner City Community Organization (MICCO). I was recommended by fellow MIT architectural black student Reginald Griffith. He had his own design office and later became director of the National Capital Planning Commission (NCPC) in Washington, DC.

When I went to MICCO, Nixon was president. Walter Fauntroy was there as formal director of MICCO. He went into Congress. They had a whole area, 650 acres. I think there are about fifty to sixty thousand people over there. He moved into Congress in DC as its representative. He needed someone to come in and take his place. I mean, that was one of the only places in the country that had their own physical planning staff to include their own social planning.

I went in and that thing was really kind of phasing out. They wanted someone to come in and take it over, to revive it. You know, God protects the innocent and the fools, so I did take the job. That's how I got to meet Mayor Washington, Marion Barry, and all of them. I was there for two and a half years. The whole program phased out because Nixon definitely was going to take it away. I think you could see how that has changed the situation.

How I happened to get to Morris, I really had to consider strongly a position offered to me with Housing and Urban Development in Washington,

DC. I was waiting for a position to open up, which I could have worked at, as head of the architecture department of the HUD agency. It never did. My wife had an appointment at the University of Minnesota. The dean had left on sabbatical leave in education and she took the teaching position for two years. My kids were here near Morris at St. John and St. Benedict high schools. The University of Minnesota was starting a minority program. The first coordinator quit and they just happened to say, "Why don't you try it?" That's how I happened to get to Morris.

You've stayed in that position how long now?
Twenty-five years.

What have been the highlights of your career in that particular position?

I think the highlights for me, I've always wanted to do something for the black community. That has been the crux of my whole thinking from the time I grew up until now. In fact, I was thinking in terms of really going into sociology and giving up architecture when I left Ripon College. I had a chance to go to Northwestern University to work on my master's. I really was fighting that battle. It just so happened that I got into MIT. I probably would have gotten a master's in sociology and gone into teaching or something later on. It just happened that fate moved me in that direction.

I think the highlight of my life has been doing something I feel has a significant impact on that community that changes its condition, that provides the opportunity for those students who come behind us to make changes in the country. I felt that perhaps architecture could do it. It only does that to a small degree as plans are developed for a particular area. Once I got out of architectural firms and moved into planning, it became a whole different phase of things. This progression continued into Model Cities, MICCO, and into the other area of education, which I wanted to be in anyway. Then my life changed in another direction.

How is that?

The thing is, I think, that I've been able to impact the lives of a number of students for the twenty-five years that I've been here, such that these students have made a difference not only at the University of Minnesota, Morris, but in the city of Morris as well. That includes a significant role in shaping not only their own lives but the society surrounding us. In the program itself, I came in

with the idea that I could transform both the university and the city of Morris. I said, “I think I’ll make this, as a dream, the best program in the state.”

Do you think you have?

Yes, that’s what they tell me.

What evidence do you have?

Well, the study that came out from NCATE, North Central Association of Teacher Education accreditation for the university, saying that one of the six strong points of the University of Minnesota, Morris is the minority student program. The evaluations that came through said that I had the best program in the university system. In fact, we have continually developed the minority student program process. The programs have moved beyond their beginning into the twenty-first century. We had developed a five-phase process. In fact, in five years—from 1990 to 1995—we had the highest graduation rate of minority students in the university system.

We have a process now started by a University of Minnesota science professor. We call it the ME3 Program, the Minority Education Encouragement and Enrichment Program. That grew out of an eleventh grade summer project of bringing students in science into the university who did not have perhaps the training of the best students. We brought them in for experience on a five-week basis with the science faculty. They’d do experiments and present them at the end. They stopped funding that program, so we had to do something with the teachers. They would no longer finance students from the federal government.

Dr. Sungur, a former head city planner from Turkey, is now a statistics professor. He came to this country, got his master’s in architecture, didn’t want to go back to Turkey, and got his Ph.D. in statistics. He helped me lay out a five-phase process. We have a teacher institute the first year. We bring those teachers in. It’s a phase thing. We work with those teachers on the newest techniques in math and science, what’s being taught on the college level. They in turn bring to us methods on how to work with their students. Over a period of five to six years, we can impact significant change in their science teaching.

For example, we had the worst schools in Chicago—the West Side—participate in the teacher institute. Seventy-five percent of those

kids drop out or get kicked out. The way our setup is in Minnesota, there is a high percentage of minorities now. We have brought those teachers from Chicago and from here in the Twin Cities and the rural areas, and we’re in our third year of the institute. There are common math and science teaching problems in both the rural and metropolitan areas. We feel that within five to six years those schools ought to be on par with any other school.

In our second phase, we bring the students in from those high schools and work with them to develop research and science techniques. We work with them on experiments four weeks or so with professors, develop their techniques for doing research. The third phase, we go into the community, work with those students, those teachers, and those parents, and use the scientific methods for doing things for that community. Then the fourth phase, we bring accepted University of Minnesota students into our Gateway Program. In that Gateway Program, we teach them math, English, and computers. For five weeks they are taught by full-time professors. Then we move them into our system. In the fifth phase, those students go into engineering or go on to science teaching. An example—they can go back to Chicago and be an intern for three years, get paid at the master’s level.

So what we feel is that that cycle is a beautiful cycle because not only are we attempting to update the skills, but we are feeding those kids back into that community. I think it’s the most magnificent process. We have committed to three phases as of right now with funds. What that does is involve the four different departments. The science department is involved because they learn experimentation and teaching; the education department is involved because their teachers are teaching in the system; the humanities department is involved to some degree because we have teaching and mentorship programs developed through their faculty, and so is the social science department. Not only do we have a program that works with minority students in terms of recruitment-oriented issues, but we can also reach into each department through this type of program. At the same time, that institute is there and the kids are doing research in the community, while participation is also taking place in the Gateway Program. So you get a reinforced process in each phase.

Sounds fantastic.

Half a million dollars over five years for both the teacher institute and Gateway programs has been allocated by the university and other government resources. So I feel that the program, rather than being something on the side, adjunct to the institute, has really collectively become a part of the evolving institute in terms of doing something not only for our students but with all students. Finally, the University of Minnesota William B. Stewart Scholarships were established for financial assistance to minority students majoring in science and mathematics or pursuing graduate degrees.

It sounds like that's one of the most gratifying efforts you have developed in your career, really. I mean, to see that you've put your hands on and to see it develop like that, that really is a model.

We came in with twenty-five students. The Twin Cities said it would be impossible to develop a program like that in rural Minnesota. Now we are sixteen percent of the entering population and fifteen percent of the total population, whereas the total university only has eleven percent.

What advice do you give to young black men and women who would be entering places like MIT or your school, Morris? What kind of advice do you give young black potential achievers in education now? It would be very useful to hear what you have to say about that. If you had to give advice to younger folks and make them listen to it, what would you tell them?

I think that the first thing a student needs to do—a black male or a female—is they should prepare themselves during their undergraduate years by concentrating heavily on those areas that will impact their going to an institute like MIT. That is, they should concentrate on the math, the science, and those areas in computers—if that is the thing that they want to do. At the same time, I think tutors in testing techniques are very important at this point. They need also a well-rounded general education, so that they are able to see all those impinging factors around them. It isn't enough simply to be in science. I think they need to have a strong commitment to a sustained effort of achievement, and yet be willing to fail. I think a student needs to experience failure if possible. If they can move beyond that failure point and rise above that, then I think you can understand the difficulty. They can take any adversity that may present itself.

I think also the students should get involved in activities that will test their ability to “lead,” take “initiative” on their own, develop the working relationship between themselves and other people, and embody themselves in something that they really like to do that will develop their creative talents. The students they compete with are in that stature. They need a good, healthy, strong concept of who they are, too. If that's fragile, then the type of obstacle they face will be difficult and they're going to have to be bi-cognitive. They're already bi-cultural. They're going to have to be bi-cognitive too because the obstacles they may face beyond that will require that. They need a good strong grasp of black history so they know where they come from. They also need a good strong grasp of who they are in identity and self-concept.

I had to go through that. Unless they can operate from that base, I don't think anything could turn them around because what's going to happen is that they are going to be tested all the way through. If you know who you are, you can make the rest.

Is there any other comment about the MIT experience or anything else that you would like to make sure is connected with some of your thinking at this point?

The experience that I've had with people who persist. An old man told me something once, “Son, let me tell you something. When you really want something, you need to be like a bulldog. Once he gets his teeth in you, he doesn't let go. When you persist for something, you've got to get in there and roll up your sleeves and drive on to it.” That encompasses a broad type of thing that you don't let go. It musters all of your residual mental and physical powers. You have to set up some goals and objectives for yourself.

The thing about that, it's like going along a road. There's no resting place on the road to revolution or evolution and there's no resting place on the road to getting where you want to go. You cannot let those outside things affect you. You have to keep moving in a direction. You have to plan ahead. You have to set a goal, a series of short- and long-range goals, whether or not it's affecting your other relationships, even family. Your family is important. But if you keep that goal ahead of you and then plan all the other things around it, then you'll make it in my eyes. But you must have a goal and you must have a mission. Then you have to

evaluate these goals and objectives. You have to know how to analyze those goals and what you have to do to begin, re-approach it, and go through it again. Use the higher levels of Bloom's taxonomy of educational objectives—hierarchical thinking, in a sense. Finally, keep time to laugh at yourself.

You must have a mission and a goal. It has to be something that you want to do, really want to do. You really have to concentrate. You take whoever you can along with you, but you have to keep on that track. If anything dissuades you along the way, then you won't make it because there are so many trials and tribulations. And it's only for a short time in education before you leave. It only takes usually four years out of your life as an undergraduate, or whatever it requires out of a young life, so you have to delay gratification.

There's no time for fancy clothes. I had all that stuff, took my steamer trunk and suitcase down there full of clothes. I set it all aside and put on my fatigues. It doesn't matter. If I didn't have a car—could not afford it—that didn't matter either. You take your trunk on your back or your house on your back, and that's what I had to do because there was no home to go to. Then when you get through, you buy the necessary items to live. But that's very difficult if these material items matter to a black student.

I maintained the expression that the MIT experience was a "love-hate relationship," in tribute to those who survived in those early years.

REGINALD W. GRIFFITH

b. 1930, BArch 1960 (architecture), MCP 1969 (city planning) MIT; designer, architect, city planner; founder, Griffith Associates, 1970, a firm specializing in city planning and community development; founder and senior partner (1980-1983), Communitas; taught city and regional planning at Howard University, University of Pennsylvania, and George Washington University; executive director, National Capital Planning Commission, 1979- ; visiting scholar, MIT, 1989-1991; recipient, Presidential Distinguished Rank Award, 1998.

I was born in 1930 and come from a small family—just my mother, my sister, and I. I grew up in Harlem in New York City. We were like many other small families in Harlem, struggling and poor. This was in the '30s during the Depression. I know I've been very fortunate, even blessed. My sister, Gloria, was three years older than I. Because we were such a small family, we were just very, very close-knit. If I can characterize the family in any way, there was just an immense amount of love between the three of us, really. So in that sense, it was very, very good growing up.

I went to the normal elementary schools in New York—two of them, PS 157 and PS 10. I went to two because we moved, but stayed in the general area. The fact that I went to those two particular schools is also important because of some odd circumstances that developed later.

My mother was very proud. She was a dancer and singer. My father, who had left just about the time I was born, was a musician also. They didn't get along, so they split up. My sister and I were first generation born here. My parents were born in Panama. Before that, their parents were born in other parts of the Caribbean. In a sense, that also impacted me because my mother had a feeling that we—my sister and I—could do whatever we wanted. She didn't think in terms of race. She knew there were racial problems, but she just felt that whatever we wanted to do, if we worked at it, we could do it. That's the way she counseled and encouraged us.

I remember some of the good things and some of the bad things. Some of them are really

mixed, because I remember my mother being concerned that we didn't have enough to eat. This sounds strange today, I know. I was in the lunch and breakfast program in elementary school, where they would give us lunch and breakfast. I didn't go hungry while I was there, although later, after you outgrow the program, it becomes a little more difficult. For example, another thing I remember is being in church with my mother when I was a child and falling out, fainting. She was very concerned and took me to the doctor to find out what was wrong. She later told me that the doctor basically said, "Well, this kid is malnourished."

But in spite of all of that there was just, as I say, so much love and sharing of everything that we never thought of ourselves as being poor. Later, when I was in junior high school, my mother

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with Reginald W. Griffith in Washington, DC, 18 September 1998.

mentioned to me that she hoped she had done the right thing by saying no to one of my teachers in elementary school who had wanted to adopt me, help me, and ease what she imagined was a strain on the family. The teacher—I think her name was Mrs. Polikoff—happened to be a white teacher, and I guess she really liked me. In those days, New York was not quite as segregated as it later became in many areas. Harlem certainly wasn't. There was a mixture.

Because my mother was in music—as I said, she was a dancer and a singer, and interested in both jazz and the classics—my sister and I became interested in those things. I think, in a sense, that saved us. While we hung out with the rest of the kids on the block, we were saved because one, we had a mother who kept saying we could do whatever we wanted to do, and to keep trying; two, we had teachers who were interested in us; and three, because we were poor, we had to work. We had a limited amount of time for hanging out on the block.

That combination worked pretty well, but we didn't escape ghetto ills completely. While elementary school was okay, when it was time to go to junior high school things changed a bit. New York had that system of elementary, junior high, and then high school. The junior high school in the neighborhood was Cooper Junior High School, which was known as the "bucket of blood." Even though I was working after school, there were things that happened in school. We didn't escape it all. I didn't have to run with gangs because I had a cousin who was close to one of the gangs. I was protected, so to speak. Even so, I was stomped a couple of times, I was stabbed, and I was shot at—fortunately missed.

I know angels or talk about angels is very popular nowadays, but I've believed in angels for a long time because going to a school like that was a challenge. Out of about twenty guys I grew up with, there were three of us who actually ended up in college. One went straight to college, I and another went in a roundabout way. Half of the other guys ended up in jail, and, believe it or not, the other half ended up on the police force—except for one guy who went to the sanitation department. It was a strange group.

The other thing that sort of saved me was the Police Athletic League. For years I lived on Lennox Avenue between 122nd and 123rd, but we used to

hang out on 123rd near the police station. Sooner or later the police got to know us and many of us joined the Police Athletic League, which at that time was a good place for what spare time you had to take up some other thing. I used to draw a lot, so I did some drawing and sketching there. They taught me how to box and some called me "Little Joe Louis." I figured if I knew how to box I could escape some things.

It was a fun time, even though it was a struggling time. The thing that I remember is that the end of junior high school was really the pivotal point. I had never thought about college, never even thought about anything other than the fact that I was going to earn a living somehow. In junior high school, because I drew a lot, when it was time to go to high school, I looked around and I said, "What do I want to do?" I was pretty decent in math and some of the sciences, so I said, "Gee, I think I'd like to go to one of those schools like Brooklyn Tech or Stuyvesant or Bronx High School of Science." Those three schools were "the three," the equivalent of what they have now as magnet schools. They were competitive, so you had to take an exam to get in.

The thing that I remember most is that my guidance counselor in junior high school would not let me take the exams. He said that I couldn't do it. I went home and told my mother, "Gee, I wanted to take these exams, but this guy says I can't do it." My mother was less than five feet tall, small but actually forceful, and she went over there and spoke to this man. She had a bit of a temper sometimes. She convinced him that I would take the exams. He basically said, "Well, he's just going to embarrass us. He's going to embarrass the school, but if you insist—he's going to embarrass himself—we'll let him take them." My mother came home and she told me that I could take the exams and that I would pass them.

So I ended up taking the exams. I studied very hard for them. Fortunately, I did pass them.

You had a courageous mother.

Oh, yes. She then told me, "Do something that will make you happy. Go to the school that's going to make you happy." I hadn't thought about college. Bronx High School of Science sort of prepared you for college and Stuyvesant prepared you for college. But Brooklyn Tech had dual-track courses. They had one which was heavy on the

academics for college, and they had another which was more vocationally oriented. I decided it would be wonderful if I could go in there and learn something about art and things that I was interested in. So I went to Brooklyn Tech to take the vocational side. I ended up taking industrial design at Brooklyn Tech, with the idea that I would come out and get a job.

Two things “hit home” in terms of follow-on. One was that while I thought I knew math from junior high school, I didn’t know enough. In one of the first math classes I had, the instructor asked me to do something up on the board. I didn’t do it correctly, and the guy looked at me and said in front of the whole class, “You call yourself a mathematician?” So after that I decided, “Well, I’m going to prove it.”

That was good because I ended up not only trying to prove my worth in math, but in everything. I did very well while I was at Brooklyn Tech. When I finished, I was well trained. In industrial design, they taught you essentially what was going on in the field by giving you these mock projects to work on. I had to design radios and other appliances. Television was just coming out and I had to design television sets. I had to design clocks, cooking ranges, pencils, pens, perfume bottles, industrial drills. It was a fun kind of thing to do because you had to do research in terms of what’s out there now—why do these things operate the way they operate, and how can they be made better in terms of operations? I learned lots by the time I finished high school.

At that point, because I had done well, I said to myself, “Well, now I guess I’ll go get a job as an industrial designer.” I was very fortunate, because New York had the four largest industrial designers in the world there. I decided, and my mother encouraged me, to start at the top. I went to the largest industrial designer—Raymond Loewy Associates—and they virtually wouldn’t even let me in the door. This was in 1949. Then I went to the second largest, Henry Dreyfuss. They let me in the door, sat me down, looked at what I had to show and talked to me, and then basically said, “You’ve got some talent. It would be wonderful if we had an opening, but we don’t have any openings. If anything comes up in the future that we think you might be interested in, we’ll let you know. So thank you very much, good-bye.” I left there and I went to the other two. I got in those

doors also and they said I had talent, but they had no jobs.

So I ended up working at a five-and-dime. Prior to that, I had worked in the five-and-dime as a stockboy while I was going through high school. I went back and they said, “Well, now that you’ve done all of this design stuff, you can be an assistant window dresser.” That’s how I started my “design career,” as an assistant window dresser in W.T. Grant Company on 125th Street in Harlem.

While I was there, about a month or so after I got there, I thought that probably one of the reasons why industrial designers didn’t hire me was because I hadn’t been to college. Pratt Institute in Brooklyn had an evening course in industrial design, so I started going to that evening course. Pratt didn’t offer degree work then. You finished after, I think, about three or four years at night, and you got a certificate. I felt, “Well, maybe that will help me.”

I was in the process of going to Pratt at night and working at the five-and-dime when I got a letter. I have to smile. We didn’t have a phone then either. I got this letter from the Dreyfuss Firm, the second largest industrial designer. They said that they had an opportunity, if I was interested in it, as an office boy. I was excited about it. I spoke to my mother and my sister about it. It was a big decision because at the time my sister, who was three years older than I, was going through nursing school at Bellevue. My mother and I were contributing from what we were earning to help her get through. The office boy job at Henry Dreyfuss paid less than my work at the five-and-dime. But we decided that it was getting my foot in the door of an area I was interested in, so we would struggle and make it.

That was the turning point of my life ... Forgive the tears: my mother died about a year ago.

I’m sorry to hear that.

I’m still going through her belongings, and I found all of this information that she saved, including the work I did at Brooklyn Tech and my industrial designs and letters from the Dreyfuss Firm. It’s a little emotional.

That’s understandable.

I went to work for Dreyfuss as the office boy. It was a very interesting job. This was still in 1949. Dreyfuss had wonderful clients. Their industrial

clients included Hoover Vacuum Cleaners, RCA Victor, Bell Telephone Labs, AT&T, Warner Swayze, John Deere, American Export Lines, Ingraham Clocks, and others. They really had a variety of clients that were just great. So when I went to work there as the office boy, I had to take care of the mail. I read everything that was coming in and everything that was going out. It was interesting because you learn a lot that way. And, I was continuing to go to school at night at Pratt Institute.

At Pratt, they would allow us to choose our projects. They'd say, "Choose a clock or something that's manufactured." I would choose something like a clock, design it for my classwork, and then put the design on the desk of the designer at Dreyfuss who was working on Ingraham clocks. Or, I'd choose to design a radio and put that design on the desk of the designer who was working on RCA Victor projects, indicating, "This is an idea, guys." I was not expecting anything out of it—just "This is an idea," hoping that maybe one day I'd get a chance to work on something.

Henry Dreyfuss was an unusual individual. He had only two offices, even though he was the second largest industrial designer in the world—one in New York and one in California. He would spend three months in one, then the following three months in the other. He lived in California, but he'd bounce back and forth. When he was in New York, they introduced me to him. This great designer seemed to be a very personable guy, and that was the end of it. He was a very, very, very busy man. He worked extremely hard. His wife was in business with him. For some reason, I thought I liked him. Consequently, I just felt at home in that office. The firm had highly talented people. As much work as they did, it was a relatively small office—I don't know, maybe twenty or thirty people. So everybody knew everybody. It was like a little family.

One time Dreyfuss came in near the end of his second three-month tour and said to me, "I understand you've been putting ideas on drawings and leaving them around the office." I said yes. He said, "You really want to be an industrial designer, huh?" I said, "I think so." He said okay and that was the end of the conversation.

Several months after that, after he had gone back and come back again, I was working late one night. It must have been about nine o'clock or so.

I didn't have to go to Pratt that evening, so I was working late. He was there late also and he called me into his office. He said, "Come in and sit down, let's talk." We just started a general conversation and I learned so much in that talk with that man. We discovered that I had gone first to PS 157 and then went to PS 10, while he had gone first to PS 10 and then to PS 157. We laughed about that. I discovered from some of the things he said that he was Jewish, but he believed more in God than in any particular religion. He laughingly said to me, "You know you really have to believe in God." I said, "I believe in God." He said, "It doesn't matter what religion you are." I said, "I know that." He asked, "What are you?" I told him I was a Roman Catholic. At which point, he said, "Do you know where I say my prayers every time just before I have a big meeting and I really have to depend upon it?" His offices were on 58th Street near Fifth Avenue. He said, "You can't guess, can you?" I said no. I was thinking about what synagogues were in the areas and could not guess. He said, "I go to St. Patrick's Cathedral, which is close by. I just sit there quietly and pray and get up and do what I have to do."

He was that type of individual. We ended up talking about everything that evening. We talked about religion. We talked about race. We talked about why he was not the first or the largest industrial designer. It had to do with his ethics. In order to be that large, you'd have to work for Detroit—that is, the car manufacturing industry—and at that point in time car manufacturers were more interested in flash and glitz than they were in safety. I knew they had been after him, wanting him to design for them, because I had read the letters coming in. Remember, I was the office boy. But he never said yes, he never accepted. We talked about a number of things into the night. I felt honored because this was a guy who was very much in demand and his time was extremely valuable. We just had a very wonderful conversation and, as far as I was concerned, it was great that the boss would talk to me in such a personal manner.

That was the end of it, except that he did tell me, "If you really want to be an industrial designer, keep putting your drawings out." The next time he came in, he said, "I want to talk you about what it means to be an industrial designer." So we had another conversation. He told me how at that

point in time the manufacturers depended very heavily on the outside industrial designers. That was going to change, he said. He was right. But at that time manufacturers used independent designs a lot. Your designs had to be right. If you made a mistake in terms of how you designed a product, the manufacturer could lose millions of dollars—or tens of millions, depending on what the product was. Therefore, he said, it was very unlikely that I, as a Negro, could gain the confidence of a manufacturer. It was very difficult for him as a Jewish person to get that kind of confidence. Although he didn't wear his religion on his sleeve, word gets around. However, I did display talent, he said, and therefore I would always have a job with him.

That was nice. I said, "What do you mean?" He said, "Well, you're still the office boy. But any time you finish your duties, feel free to work on any project in the office. Just go on the board—design, so to speak—and we'll really consider it in what we do." That was tremendous for me, really tremendous. I was very, very, very happy at Dreyfuss.

Then later, they encouraged me to go to school. He said, "Pratt is nice, but if you really want to be an industrial designer and get a full background, you really should get a degree, not just a certificate." I said, "Well, I can't go to school during the day." He said, "Why not?" I said, "Well, I have to work." He said, "Well, maybe I can help." I said, "No, no, no. You can't help because I've got other obligations," or words to that effect. He said, "What obligations?" I told him I was helping my sister through nursing school. He said, "Well, that's good and you should do that, absolutely. But at some point she'll be finished, so maybe you should at least apply to some of these schools that offer degrees." I said, "Okay, I'll do that." He said, "Some of them have cooperative programs. You can work and you can study." I said, "Okay, I'll do that."

So I applied to several schools. One of his associates in the office, a fellow by the name of Bob Hose, said, "I'd like to see the schools you apply to." In those days there was only one university that gave a degree in industrial design. At all the others, to become an industrial designer you had to take a combination of architecture and mechanical engineering. I think it was the University of Ohio that had the degree program. I was looking at that school and others. People in the office asked, "Which schools are you looking

at?" I'd pull out my list and show them. This fellow Bob Hose said, "I don't see my alma mater there." I said, "What's an alma mater? What are you talking about?" He said, "The school I went to." I said, "Oh, what school did you go to?" He said, "I went to MIT." I thought, "Whew! This guy is thinking that I should be able to even think about going to MIT?" He said, "Well, you know, when I went to MIT they had rather a good support program for people, both financially and in terms of academics and everything. So why don't you apply?" I said, "Really?" "Yeah," he said, "apply and see what happens."

So I applied. I think in those days you had to take some kind of exam or aptitude test. Anyway, I did that and I remember sitting on the bed with my mother and saying to her how much I wanted to go if I could get in. What she said was, "Pray." I said, "Well, I am. If I can get in, I'll never ask God for anything else." She got very upset and said, "Well, don't you ever think you will never ask God for anything else, because that's not the way life is. But I'll pray that you get in."

As it turned out, we got the letter from MIT. I had been accepted at some of the other schools too, but MIT said, "You are qualified in terms of aptitude, etc. We'd love to have you, but you don't have the prerequisites—so sorry. If you get the prerequisites, we'll consider," or words to that effect. I said, "Wow." They listed the prerequisites. I lacked a couple of years of language and a couple of years of advance math—trigonometry and geometry, stuff that I hadn't taken at Brooklyn Tech at a high enough level—and history and all sorts of things, because I had been in this vocational track. They listed all of these courses I needed, and I was devastated. I was happy that they said I could have gotten in, but I was devastated that I didn't have the prerequisites.

I was torn between whether or not I should pursue some of the colleges I did get into, or whether or not there was any way for me to get these prerequisites. I thought about it. I talked to some of the folks in the Dreyfuss office about it. They said, "Hey, you know, we're right here on 58th Street and there's this little preparatory school about three or four blocks away." I said, "What's a preparatory school?" They said, "Well, it's a school that has accelerated courses, so that instead of taking six months to do something, you might be able to do it in three weeks or six weeks. It's very inten-

sive. They have it and you might want to go there and see what they've got." I said, "Yeah, but I couldn't do that because I have to work." They said, "Oh, they've got some courses at night that are accelerated."

So I went and I inquired about it. Sure enough, they said, "What do you need?" I laid out what I needed. They said, "You might be able to do that in about a year-and-a-half." I said, "Really?" They said yes. I said, "Could I do it in a year?" They said, "You're working during the day? No, you can't do it. You'd have to come at night and there's no way you could do that in a year." I said, "I'm going to try." I was young and energetic and a little crazy.

I went home, and my mom and my sister and I talked about it again. Again, there was the decision as to whether or not some of the money that I was earning at Dreyfuss I could take to go to this school, because it would cost me more than I was paying to go to Pratt at night. My mom, my sister, and I decided to try. So I quit Pratt. I had gone through Pratt for one year at night. I quit that and then went to this other school, back to high school at night, in order to get these preparatory courses.

By that time I was a design apprentice, so I was doing more work at Dreyfuss. It was exciting, it was really exciting. I was very, very fortunate. I ended up doing more than I thought I could do. Not only did I take the full load so I'd be finished in twelve months, but according to their rating systems, I was number one academically. I wore myself out. About three or four weeks before the end of the semester, when I was going to finish everything and do final exams, I just collapsed. The doctor said, "Stop. Go to bed for a week and don't think about anything else." That's what I did.

You were determined.

Yes, it was a different time then. What happened was, I went back and I took the exams and did very well. The school was very embarrassed because the school knew I had been number one, but they also knew I had worn myself out and the doctor had told me to stop. They knew this because I had to get permission from them to stop, and then come back in time for the final exams. They believed that there was no way I'd end up number one, so when they printed up the graduation program, the student listed for the awards was the guy who had been in second place. However, after taking the

exams, I still was number one. They were embarrassed. They said, "We don't know what to do. We didn't expect this. It's all on the program." I was so happy I just said, "I don't care. Give him the awards, as long as I've got the number one standing." They said, "Yes, you got it."

So I got my second high school diploma and, since I was number one, MIT admitted me. That's how I got up there. It was different. The Dreyfuss organization wished me luck, but Henry Dreyfuss went further and said, "It's expensive to go to MIT. Let me help you." I said, "No, thank you—I'll make it." He said, "There's no way to make it without working outside of school, and you don't really want to work that much." I thanked him, but insisted I could make it.

That was stupid—determined, but stupid. My first year at MIT I was living on East Campus. I worked forty hours a week, at night and on weekends too, on the switchboard in the dormitory. I thought that if I worked on the switchboard, I'd have time to study. Sometimes the shift was like from 8 pm or 11 pm to 4 am or 7 am, so I could work, nap, and then get up and go to class—you know, shower, wash up and go. That might have been possible, except that for a kid coming out of Harlem and coming up to MIT, it was a new world, a brand new world. I wanted to find out about it.

I think the same thing was true of the other black guys who came up. There were four of us who entered in September of '51—myself, Bill Antoine, Kermit Lee, and Snowden Williams. All four of us had come from essentially black neighborhoods and we were in this new world. We got involved in all sorts of things. I probably got involved in too much. Bill and I were both on the track and field team. I think Kermit was involved in any number of clubs. Snowden was involved in student government and I was involved in student government, in drama club, and all sorts of things. It was just a wonderful place to be. It was great. The world was mine.

I flunked several courses my first year. Maybe I flunked three of four. I flunked two per semester, I think, which was a shock. Then, I went back during the summer to work for Dreyfuss. They said, "How did you do?" I said, "Well, I didn't do that well, but I'll make it." So we went through the same thing again. Dreyfuss offered to help and I refused.

I went through my sophomore year. I belonged to less activities. Dreyfuss asked me the kinds of things I was involved in. He was an interesting man and, reflecting on my answer, he said, "Well, out of all of those things you're involved in, you might want to stick with student government." I said, "Yeah, I think I will because I really like it. I learn a lot. All sorts of things are going on."

The other thing that happened—I think it was during my freshman year, but it might have been my sophomore year—was that because I was involved in these various activities, I began to know a lot of people. Even though there were just four African-Americans in my class, there were other Africans and of course people from all different countries, fifty or sixty different countries at that time. I used to look at the statistics. That's why I remember some of that. One of the things that happened is that I got rushed by a fraternity. The fraternity, that shall remain unnamed, said, "Hey, Reg,"—"Reggie" in those days—"we like you. Come join us." I said, "Wonderful." I remember being rushed because Gus Simonides was rushed at the same time. We used to talk and joke about it. The fraternity said, "Okay, we're sending your name in to national." The national said no, because I was African-American and it was against their policy. The local guys wanted me, but the national group said no.

That created a bit of a ripple effect. A lot of people got interested in it, including Gus and some others. (Gus is Constantine.) Not too long after that, and I don't know if my situation had anything to do with it or not, I think some of the fraternities became what you call "campus fraternities." Then later on, of course, MIT adopted a policy that the rules of the Institute would be what the fraternities had to abide by and not the national rules, when it came to things like race or ethnicity at least. But that was interesting. For a while, I associated with a black fraternity in Boston. I remember going to Roxbury and meeting with the guys several times. I stopped doing that because it became too much. I was still working and going to school.

Looking back, I was very fortunate, and I know MIT was very good to me. I came in at a time when, at least in the architectural department, they had ninety-five percent truly dedicated, absolutely open-minded faculty, I think. Notice I didn't say a hundred percent.

That's very good, though, ninety-five percent.

That's right. They became interested in me. I was a good designer. I was a bit more mature than my classmates because I had lost those two years between Brooklyn Tech and MIT. And even before that, I had lost another year because when I went from junior high school to Brooklyn Tech, I had to begin in the eighth grade. My junior high school went through the ninth, so I lost a year there. But it was worth it, I thought, at the time. Anyway, I was more mature than my classmates, a few years older.

I did very well in design and architecture. I discovered that I loved architecture, but did not like mechanical engineering that much. At that point, even though I was still interested in industrial design, I said, "Hey, maybe this architecture has something to it."

I went through my sophomore year and this is something of a blur to me. I have to check the exact date. It was either in my sophomore year, but I believe it was at the beginning of my junior year, that my sister—who had finished Bellevue and had married—was murdered. That shook me up. That tore up my mother and myself. It was too much. Bill Antoine I well remember tried to help me, because on the heels of my sister's death the only thing I'd want to do would be to go to the movies. I'd go to class and not be there. I'd work and then sometimes I'd not go to class, and I'd go to movies. Bill would say, "You've got to stop this. You've got to get your head straight." But I'd continue to go to movies.

I think it's at that point that MIT became more of a family. The instructors knew what had happened and they would encourage me to try and they would help me. Anderson watched me. That's Lawrence Anderson, who was the head of the department of architecture.

Yes, I've heard the name.

He watched me for about a year, maybe even a year and a half, go along this bumpy road. He would periodically say, "Maybe you should stop, take off a semester, and come back." I'd say, "No, I can make it." I usually got A's in architectural design courses. Maybe once in a blue moon I'd get a B, but usually I'd get A's. Belluschi thought I was a great designer. I was going to be another I. M. Pei or Le Corbusier or whatever. In my head, I was going to be that. I knew the system. My strategy

was to do well in the heavier-weighted architectural design and related courses, and I'd catch up on the other courses later. I didn't mind flunking a course or two per semester. That wouldn't disqualify me because of the weight of the courses that I knew I could do very well in.

That was my strategy—smart guy. Well, by the time I reached the beginning of my fifth year—architecture had a five-year curriculum—I was approximately a year behind because of the courses I had not passed or had to take over. I had received warnings, but I was never disqualified because my grade point average was just high enough to get by.

You had done so well in your architecture courses.

That's right. I entered my fifth year and Anderson was my instructor in architectural design. I do my normal thing and I know I'm going to get an A or at least a B. Anderson gave me, I think, a D, which disqualified me. There was no way that my grade point average could keep me at MIT. I remember going to him in his office and saying, "You can't do that. It's unfair. You can't possibly do this to me. Look at my work. Look at what I did. Look at my analysis. Look at my design. Look at So-and-So's work that got a B. Look at So-and-So's that got even a C. Look at So-and-So's that got an A. You can't do that to me. It's unfair, absolutely unfair. You just can't do that. How dare you do that!"

Anderson, I remember, just leaned back in his chair behind his desk, looked at me—first somberly, then with a little smile—and said, "Guess you'll have to stop now, won't you?" I was boiling. Not only was I boiling because of being disqualified, but by that time, because of my rocky road, my mother had been concerned about whether or not I was going to make it and I assured her I would. Henry Dreyfuss apparently had been keeping tabs on me and continued to offer assistance. And I had finally said, "Yes, I will accept some financial help." For about a year or two, I had been accepting some financial help from him, so that I wouldn't have to do all that income-producing work. How could this guy, Lawrence B. Anderson, do that to me in an unfair manner? If I deserved it, fine. If I hadn't done the work, fine. But how could he take the work I had done and not grade it correctly and, as a result, not only flunk me out, but put me in a position of disappointing my mother, who had made all of these sacrifices, and

Dreyfuss, who had all this faith in me? How could he do that? I was annoyed, shocked, angry.

That was the worst thing that happened to me at MIT. The interesting thing is that it later turned out to be the very best thing. Anderson said, "Come back in six months." I forget exactly what I said—maybe "I'll be back," but it wasn't said in a nice way.

So I left MIT and I went to work. By this time I wasn't working for Dreyfuss any more because I had become truly interested in architecture and had worked for architectural firms. I got a job with another architectural firm. As it happens, just prior to that, I had injured my leg in athletics. MIT had great services in terms of medical facilities and Dr. Chamberlain, I remember his name, had to operate on my leg. I remember because it was one of those spinal procedures where you're awake and you can see. They cut me in the groin, they cut me at the knee, cut me in the ankle, and then they pull out this long vein. It's gore, but I'm watching this stuff. I'm on crutches when I leave.

Then I get this job in architecture, and no sooner do I start working than the Army says, "You're drafted." I remember going down to the draft board on crutches. I protested, "You can't draft me because I'm going back to school. How can you draft me? I'm 4-F. I'm on crutches." They said, "It'll heal." As it turns out, there was nothing I could do to convince them not to draft me. They gave me my date of reporting. My head cleared up enough for me to do a lot of research. I had taken all of my ROTC coursework. Architecture was a five-year course and I had gone through four-and-a-half years. I found a little regulation that said if you have satisfied your ROTC academic and training requirements, and if you numerically have enough points for a degree from the institution that you're attending, you can accept your commission. I had satisfied the ROTC requirements. Now, I didn't have enough points for an architectural degree, otherwise I would have had my degree. But the regulation didn't say that I had to *have* my degree. It was a numerical thing.

I looked up all of the degree requirements that MIT had, in terms of number of points, and discovered that I had two more points numerically than was necessary for a mathematics degree. So I said to the Army, "Hey, guys, I really don't think I should go. But if I go, at least you should be able

to give me a commission because I meet this qualification." They looked at it and concluded, "Yes, we guess you do."

So the Army commissioned me as an officer in the U.S. Army Corps of Engineers based on the numerics. I'm not certain they had to, but they did. Again, I was fortunate. I did well in boot camp, officers' training. I requested to be shipped overseas to Europe because I felt that way I might get to see Rome, Greece, the historically great classical architecture of the world, and learn something. I got shipped to Germany and France. At the time, I just happened to be wearing this ring—the MIT ring which, of course, you get in your junior year. I arrived at this Heavy Construction Battalion that I was assigned to and during my initial briefing about what my assignments would be, this colonel or captain sees the ring and says, "Oh, you're from MIT." I said yes. He says, "Well, I'm an Aggie"—that's the University of Texas, another school that's supposedly great for the Corps of Engineers. Apparently, within the Corps of Engineers there is great respect for MIT, the Aggies, and West Point. He smiles and enthusiastically proclaims, "You're going to be great here, you're going to be great."

I was the second black officer in the entire battalion. There was a major, the executive officer, who was also black. The colonel and all of the others were white. They all assumed I knew a great deal about engineering. I knew I didn't. They assigned me to build all of these missile bases. This was 1956 to 1958 and America was still rebuilding Europe, still correcting the devastating damage of the Second World War. I was assigned to build highways, bridges, missile bases, hangars, and other structures in Germany and France. It was just a great, invigorating time. I was assigned one hell of a load and I had to do it. I didn't have time to think about my sister's death or continue to feel the hurt. I learned how to work with all sorts of people from all walks of life. I learned the value of sergeants. It was a phenomenal experience, a great time. I did so well that my superiors wanted me to become a career army officer and offered to pay for my return to complete my education at MIT.

Several months before I was supposed to be released, I did two things. One is I put in for leave so I could travel to Greece and Rome and see all of the wonderful architecture I hadn't had time to see. And two, I wrote to MIT—to Anderson—and

asked if he would write a letter that might get me released from the Army two months early so that I could begin the semester. Anderson wrote the letter and I was scheduled to be released from service early. I had also scheduled a month's leave in which I could see the great classical European architecture. Then some crisis broke out in Lebanon and they canceled my leave. I didn't see Italy or Greece's great classical architecture, but the Army did let me out on time.

When I got back to MIT, my head was straight. I zipped through my classes and even made the dean's list. I still liked extracurricular work, and I began working with Gyorgy Kepes on some of his private work he was doing with Nishan Bichajian, who was his assistant. I worked on the Time Life Building mural in Rockefeller Center and then the KLM mural which was nearby on Fifth Avenue. We did some creative, arty things. I did well in all my courses. I was flying. Right after my architecture thesis presentation, before the results could be posted, I remember asking Dean Belluschi how I did on my thesis. He said, "You couldn't have done better. Come see me." I remember Anderson looking at me and saying, "Okay, you did it." Shortly after that I went to him and said, "I didn't think I'd get to this point, but I want to thank you for what you forced on me." Once again he leaned back in his chair and smiled. He said, "We wondered if you could do it." I said, "Who's we?" He said, "Me and Henry"—Henry Dreyfuss, the man who had helped me so much, the same man I felt I had disappointed. And he was in on kicking me out.

He knew about it.

Yes, putting my feet to the fire for my own good. MIT was extremely good for me and to me in a most unusual manner. When I received my degree, Belluschi basically told me I could work for anyone I wanted to in architecture. I said, "Wow, thank you," and he said, "Who do you want to work for?"

But let me digress for a moment. There's an earlier happening I should tell you about. Before that happened, Belluschi had previously called me in and said, "This firm has written to me and asked me to recommend a recent graduate who does churches." Well, I had done several churches. The first project I had in my first architectural design studio when I was a sophomore was a church, and I had done very well. Belluschi had been on the

jury. For my thesis I had designed a rather large church with ancillary housing and school facilities, and did very well on it. Belluschi had seen some of my church designs before, and knew I was interested in churches.

He went on to tell me that, according to the letter, there had been three partners. One partner of the firm had retired. One was currently very, very ill. The third one was carrying on the business. They did mainly churches. Belluschi was known, of course, for his design of churches all over the world.

Belluschi said, basically, "They've written me about this opportunity and want me to recommend somebody. I'd like to recommend you." This firm was in Portland, Maine. I said, "Really?" He said, "Absolutely. Here's the head partner's name. I'll give him a call and let him know you're coming up. And, if you want it, it seems to me that you've got an opportunity to move into the hierarchy of this architectural firm." I was elated, thanked him, and assured him I would follow through.

So I took drawings, samples of art work, and my resumé to this firm in Portland, Maine. When I arrived, there was a lady receptionist on the phone. I'll never forget it. She was on the phone, chewing gum, on what was obviously a personal call. I stood there for about five minutes and she remained on the phone, chewing gum, seeing but ignoring me. I finally said, "Ahem, excuse me." She looks up and says, "Yes?" I answer, "I'm here to see Mr. So-and-So." Mind you, I had been through school and I had lost those three years between Brooklyn Tech and MIT. Then I had lost another year or so because of bumping around, two years serving in the Army. So by this time I must have been about thirty years old. She talks a little longer on the phone, then she calls up this fellow I'm supposed to see, and she says, "Mr. So-and-So, there's a boy out here to see you." The way she said "boy" bothered me, but I tried to ignore it. I just might be working here.

So Mr. So-and-So comes out and says, "How can I help you?" I said, "I'm Reginald Griffith. I was recommended to you by Pietro Belluschi at MIT." The man turned beet red. I mean really, he was so thoroughly embarrassed that I was embarrassed for him. He started sputtering and talking and trying to say things, and finally came out with, "Well, uh, the situation, uh, has changed. It's not

what it was supposed to be, uh, my partner, he's getting much better and, uh . . ." I knew what was going on, but I stayed calm and I said, "Well, sir, can we sit down? Would you like to at least see my work?"

So he says yes and takes me into the conference room and looks at my work, just glances through it really, and asks me, "When did you work for Belluschi?" I replied, "Well, I haven't worked for Belluschi, but I have worked on churches for other architects Belluschi is familiar with. And, Belluschi is also familiar with my work at MIT. Here is my thesis, which is a church design." The guy says, "Oh yes, very, very nice. But as I said, things have changed and I'm sorry, we're just not looking for anyone now—sorry, but thank you very much."

So I left, knowing what the situation was. Some time later after I got back to MIT, Belluschi asked, "How did it go?" I was frank with him. I told him how it went. He was genuinely embarrassed because, he explained, it never occurred to him that he should even mention my race. He had taken the firm's letter as a straightforward request and responded accordingly. He said, "I'm sorry. I thought this was a great opportunity. Believe me, you've got talent. You can work for any architect you want."

I had done lots of thinking on my way back from Maine. I told him truthfully, "Actually, right now I'm not ready to pursue architecture because I've taken several planning courses and I think I can be a better architect if I take even more planning courses." Jack Howard, who was head of the planning department, had invited me to go to graduate school there. I said, "I think I'm just going to work and go to graduate school in order to take some courses." He said, "Well, okay, I'm terribly sorry."

Several days after that, his secretary, who later became Mrs. Belluschi, called me in and said, "I don't know if I should do this, but I want to show you this letter." She showed me the letter that he had written to this firm. It was the most scathing letter I have ever seen. Dean Belluschi was such a nice gentleman if you knew him, if you remember him.

Right, I do.

But when miffed, he certainly wrote the most scathing letter to this firm.

He was extremely upset.

Oh, he was more than upset. But he never told me he had done anything.

So in my experience, there were some very good people at MIT. What happened is, I went through the one year or so of planning school and was hooked. There were some very good people up there at the time in the planning department. There still are. I remember Charles Abrams, who was also a real estate developer out of New York. He used to kid about the things that dealt with development, with real estate, with race—like there not being a problem if such-and-such is the case—for example a very small number of minorities living in a community where they worked, but there can be a tipping point in terms of numbers that can trigger racial issues in communities. So we students got into a lot of those kinds of discussions. He and I hit it off pretty well because we would just tell it like it is. I learned a lot about communities and people, and how design and environment impact people.

I remember Lloyd Rodwin. He and Jack Howard said, “You’ve taken so many of these planning courses, why don’t you go for the degree as opposed to just taking courses to be a better architect?” Later, Lloyd said, “There’s this tremendous opportunity that has turned up, at least I think it’s tremendous. You might want to look at it—IIE, the Institute of International Education. Normally they invite people over to the U.S. from various countries, but they’re trying an experiment of some kind and they’re looking at the possibility of sending people from here over to other places. You”—I had taken his courses in developing countries—“seem to be interested in developing countries. Is there any place you think you’d like to go if you applied and they awarded you a fellowship?” I said, “Yes, I really would like to go to West Africa and study planning issues there.” So he said, “Well, why don’t you apply?”

Sure enough, I applied and I got the fellowship. And I was scheduled to go over to Africa. Three years before that I had met this wonderful young lady, and by that time we had decided to get married. We married just before I was supposed to go to West Africa. It was interesting, because we were young and carefree and adventurous. She became pregnant almost immediately and the question was, can we still go to Africa? Her parents were very upset, but we went. My first child, my son Courtney, was born in Nigeria.

I had some enlightening experiences over there which I won’t get deeply into, but it was eye-opening. Some of it was racial and I also learned a lot about business. I had been accustomed to the people at MIT and other people I had worked with, and they were all ethical people. Anyway, one of my classmates in planning school, a Nigerian, had gone back and he was hired by the Nigerian government. We thought I might get a job with the government, but by the time the necessary clearance went through, I had found another opportunity with a private British firm. Since the firm was doing work throughout West Africa, I could do my research while working for them. In fact, they promised that not only could I do my research if I accepted the job, but I could have a three-month paid leave period at the tail end in which to really tie the research all together. That was a tremendous opportunity, so I took the job with the private firm.

Because I was a black architect, I was able to bring in some very good business from some of the governments and municipalities. It was a happy life until it was time for them to give me my three months, at which point they renege completely. My wife Lynn and I had depended on this. By this time, my son had just been born. She ended up having to come back home with my son to live with her parents in Tennessee, while I tried to finish my research. To save costs I went native, which was also a good experience because I met a lot of wonderful people throughout West Africa. Three months later I came back to MIT, took more planning courses, and started working for the Boston Redevelopment Authority. Ed Logue was doing wonderful things for Boston.

I did skip one thing. Just before I went over, Belluschi asked me what I really wanted to do. I told him that I really wanted to go to Africa because it was an unusual opportunity to find out what was going on there. But I still remembered that he had said I could work for whoever I wanted to. He had said, “Well, who do you want to work for?” I said, “Well, when I come back and I’m finished with school, I think I’d like to work for Saarinen if I can.” He said, “I’m sure you can.”

While I was in Africa, Saarinen had a brain hemorrhage and died. So when I did come back, I started working with Ed Logue in planning and going to MIT to finish up my planning course work. I got so involved with the BRA and Ed

Logue that I never did finish my thesis while I was there. I kept saying, "I'll finish it, I'll finish it," but things were changing in Boston. Tunney Lee and I, and Konrad Perlman, Dennis Blackett, Richard Ridley, and several others were there. It was a very exciting time, changing the face of Boston with the new Government Center, Roxbury, North Dorchester, and all of that. Logue really pushed us all, and it was great.

As a result of that, I found that even though I loved architecture, there were opportunities to do things for people in planning that didn't exist in architecture. You reach a broader population. While I was up there working with Logue, I got a call from Washington about an opportunity to work with a community organization here called MICCO—the Model Inner City Community Organization. They were starting a new program that would allow community organizations to hire their own planners, as opposed to having to ask and depend upon the municipalities to plan their communities. This was an experiment in terms of using federal money to have communities hire their own local planners who would be directly accountable to the community. Walter Fauntroy here was running that program. I came down and spoke to MICCO's leadership. We liked each other, I got enthused about it, and moved down to Washington. By that time, Lynn and I had three kids—not only my son, but two daughters who had been born in Boston after we got back.

So I started working here in Washington as a community planner and activist, raising all sorts of Cain, talking about how things had to be better here. It was invigorating. I also knew a lot about architecture, and I was shocked that in a city like Washington—with probably one of the highest concentration of educated and professional blacks—there was a limit on what could be done. For example, no black architectural firm had ever designed a new school, they had only designed renovations or additions. Here was MICCO, this community organization, trying to renew the Shaw Area in 1967, and in 1968 Dr. King was assassinated. That changed a lot.

It also changed what might have been my life because just prior to that, about a year earlier, I had an opportunity to meet with Dr. King on a couple of occasions. Walter Fauntroy was very active with the SCLC. Dr. King and the SCLC were thinking about developing a strategy for helping

people, both economically and socially, in inner cities throughout the country. I believe that Dr. King had a number of ideas that would change our society, which is one of the reasons why he was assassinated.

Anyway, as a result of his assassination, Washington blew up. As you know, it was the hardest-hit city in the nation; the Shaw area, where MICCO was based, was one of the hardest-hit. The local planning agencies basically abdicated their functions. They didn't know what to do. So we at MICCO, who were initially finding out from the community what they wanted and finding out what the planning agencies were doing and telling the planning agencies what the community would like, found ourselves in a unique position. The local planning agencies basically backed off, threw up their hands, and said, "What do we do?" The community was saying, "We've got to do something." MICCO filled the vacuum.

As a result, we accomplished a lot. We were able to get black architects their first new schools, but it wasn't easy. In fact, the politics of the situation was such that when we were about to do that, these same architects were offered bigger school additions as a diversionary ploy, because the rules of the game were that if you were doing one school, you couldn't do another. MICCO knew there would be a new Shaw Junior High School, we knew there would be a new Dunbar High School. These were multi-million dollar jobs that were in the heart of the black community and could be given to qualified black architects, and there were lots of qualified black architectural and engineering firms around. So we kept telling these architects and engineers, "Don't accept the additions." Happily, they went along with us. As it turned out, Sultan & Campbell, a black firm, got Shaw Junior High School and Charles Bryant, another black architect, got Dunbar High School. Both did marvelous jobs on them, marvelous jobs. Our strategy worked.

Then I started teaching at Howard University while I was still working with the community organization. Two things happened. One is that Jack Howard, head of MIT's planning department, warned me, "If you don't finish your master's"—I had done everything, all the course work but not the thesis—"I'm going to cut you loose." I said okay and I finished it. The other thing that happened is because I was teaching

now at Howard University, I recognized that MIT had people on its staff like Aaron Fleisher, who had tremendous knowledge in transportation and costs/benefit planning, and Lloyd Rodwin, who was tremendous in planning issues related to developing countries. All of this tremendous talent was up at MIT. Howard University had students interested in this stuff, and had good but not that quality of faculty.

So I began to talk to Jerry Lindsey, who was another MIT graduate—graduate school—about the possibilities of faculty exchange. Jerry said “Yes, that’s a possibility.” Jerry was dean of architecture and city planning at Howard and had asked me to become chairman of the planning department, which I did. Then I approached Jack Howard, the city planning chairman at MIT, and said, “Can we work a deal? There’s a lot happening in Washington that would be of interest to the faculty at MIT, and that same faculty have a heck of a lot of expertise that would be of interest to the students at Howard.” Jack thought it was a great idea and said, “I can’t direct the faculty to do it, but”—and he winks at me—“I’m sure it’ll happen.”

So I went back and met with the Howard people, the Howard faculty and administration, and said, “Here’s a tremendous opportunity.” Jerry was in favor of it, I was in favor of it, but most of the Howard faculty wasn’t. They felt uncomfortable. I said, “Look, you guys have a hell of a lot to offer. You know more about X, Y, Z. You can help the folks up there learn about X, Y, Z. They can help us down here learn so-and-so.” I tried hard, but it didn’t happen. It just didn’t happen, which is a shame.

Then there is another unfortunate shame. When I left MICCO, I tried to get them to hire someone else who was good, who had the same kinds of thoughts about community development and people, and so on. I had two people in mind, and my number one choice was Langley Keyes, who was teaching at MIT. I brought Langley down and he spoke to MICCO’s board. The board said, “He’s really great, but we can’t hire him.” You know, it was reverse discrimination. I said, “Okay, I’ve got another one for you.” That’s when I brought down Bill Stewart. Bill started working as the executive director of the MICCO group while I went on and did other things.

Which Bill Stewart?

A black classmate in city planning from MIT. Bill is now in Minnesota. It’s a small world and we connect. The network goes on.

But I guess my feeling is that MIT had been really, really great to me. They—the faculty and administration—were hard-nosed about it when they needed to be. Did I run into any discrimination? Well, yes, there was the fraternity thing. But that was somewhat outside of the MIT family. In terms of instructors, yes, I think there was one guy up there who was biased. No matter what I did, I couldn’t get through to him. The same was true of other black students, and he was part of the architectural program. A number of us went around him, finally, because you could take courses in other departments at MIT to satisfy a course in architecture. So we did that.

I remember when I did my thesis, he questioned me very pointedly about how something could actually work. If I get into too much detail, you’ll know who I’m talking about, so I’ll be general. As part of my architectural bachelor’s thesis, I had to focus on two other related areas, and I focused on such-and-such. He said, “Yes, but even so, in my expertise you have to do so-and-so.” I said, “Yes, I have looked at that. As a matter of fact, I have consulted with so-and-so in department so-and-so, and he assures me that this is not only feasible but it’s a better system.” So everything worked fine.

But that was an individual and not the predominant feeling or atmosphere while I was at MIT. Do I have any advice to offer other black students, faculty members, etc.? My experience may not be the normal experience, so I feel a little odd. I hope it’s close to the normal experience, but from my point of view I don’t think it’s a black thing at MIT. It wasn’t when I was there, but then there were fewer of us there at the time. I’m not naive enough to think that with change of numbers things don’t change. I just can’t say what it is today. But from my perspective, I’d like to have students today think of MIT as really being both a great challenge and opportunity, think about MIT instructors and students as being more conscious of and responsive to you as an individual—to your mental thought process, to your initiative, to your ambition, and to your character—than to think that they’d be looking

at someone's color or race. Some of that will happen, but I think if it does happen it's in the isolated circumstance. You treat it as an isolated circumstance rather than the culture of the Institute. My experience has been that, while there may be some individuals up there who clearly have been shaped by society and may have a different opinion of blacks than is true, the culture of MIT in general is one of non-discrimination and in some cases it may even be affirmative.

That's my experience within personal limitations. I say affirmative because I believe that within the limitations of their entrance requirements, they're affirmative. The biased people I have run up against there are very few. There may be a few more misinformed types, but you can inform those. I remember as a sophomore being in one of my humanities classes when the subject of intelligence came up, and a lively debate was going on. One of the students really believed that it was no fault of people of color, especially African types, but they just didn't have it the way "we"—he was Caucasian—have it. The instructor looked at him and said, "You really believe that?" He says, "Yes, it's not their fault—it's just the way it is." The instructor said, "Well, what about Reg over there?" The guy said, "Oh, he's an exception maybe." That's misinformed. That's being shaped by a limited society and not having enough exposure to the world.

I think the Institute is good. When I've served on committees up there, I would have liked to see more people of color on the committees. I know they have some. I don't know why they don't have more, but I'm not sure what the circumstances are or were. I don't know. As I say, I've been very fortunate. The angels have been with me.

It's a very tremendous story that you've outlined here. All I can say is that it has been a struggle, but the truth is that it has been a happy struggle.

The fraternity issue was controversial during the time that you were there as a student in the mid-'50s. In 1952, the Institute Committee passed a resolution opposing discrimination, and on April 8, 1953, appointed members of the Discrimination Committee made up of you, Oliver Johns, Harry Schreiber, and William Layson, under the chairmanship of Dale Strait. Do you remember anything like that?

I remember some of the names well. In terms of the committee, I can't fully recall what the committee specifically did. I do know that in my freshman and sophomore year—especially in my sophomore year, which would be 1952–53—something alerted me to look at the blacks, especially the number of African Americans, who had been admitted. I discovered that there had been the four in my class, and that there were four in the previous class. That would be the class of 1954, I guess. There were four in the subsequent class, which would be the class of 1956. I don't know why. When we discussed it—and we did speak about it to some people, both in the student body and the administration—the answer was "no quota." But on the face of it, it would appear there might have been a quota. Happily, things have changed.

There were several of you at MIT. You mentioned William Antoine.

Bill Antoine, yes—William Antoine.

Do you remember Leonard Massey?

No, he wasn't one of the four in my class. Let me explain the four. When I speak of four, I'm speaking about African-Americans who came from high school to MIT. I'm not speaking about transferees in from other colleges, and there were several of those. And, of course, he may have been in a class ahead of or behind me. I remember the name, but not the person.

He actually came from New York as well and he just passed about a month ago.

During 1954 and '55, Eldon Reiley, you, and others on the Institute Committee started planning to host this intercollegiate conference on racial and religious discrimination in American universities. In fact, the conference was held at MIT in March of 1955, with speakers such as John Hope Franklin in attendance. Do you recall anything about that conference at all, any of the events leading up to it?

Yes and no. Unfortunately, it's mainly no. I recall that we met many times to organize and think about subjects to be addressed and about who might participate. I do not recall specifically the particulars of planning for it. I should probably speak to Eldon and try to have him jog my memory. But again, that was a bit of a tumultuous time for me. It's when I was still trying to cope

with my sister's death, struggling and using my strategy to stay in MIT. So, it's hard.

Any input that you have about that conference is important because you were the only black associated with the planning. That conference, as we look at our history at MIT, is really quite historical because it was the first time that any university in the country—at least during that period—had decided to bring together college and university representatives from all over the country to come to a conference to deal with the issue of discrimination.

You say that as I sit here in amazement. I guess if we did it, and clearly we did, I'm not sure that I or any of us knew it was the first time for a conference of that sort. It's something that we just probably thought was necessary and here was one avenue by which to pursue it—the normal MIT analytical approach.

HOWARD W. JOHNSON

b. 1922, BA 1943 Central College (Chicago), MA 1947 University of Chicago; faculty member, University of Chicago School of Business and Division of the Social Sciences, 1950-1955; joined the MIT faculty in 1955; professor of management, MIT, 1959-1966; dean, Alfred P. Sloan School of Management, 1959-1966; MIT president, 1966-1971; MIT Corporation chair, 1971-1983; president emeritus and former Corporation chair, 1990- ; numerous public service activities, including member, President's Task Force on Urban Educational Opportunities, 1967-1968, and trustee, National Fund for Minority Engineering Students, 1976-1980; recipient, Eleanor Roosevelt Key Award, 1968.

I grew up in the city of Chicago. I was born there, as my parents had been before me. My grandparents had lived most of their lives in the city, the south side of Chicago. I was born in 1922, so that makes me seventy-five at this point. My schooling was in the public schools. I went to elementary school and then high school, James H. Bowen High School on the south side of Chicago. I was graduated from there literally on the eve of World War II. I was graduated in June of 1939, and the Germans invaded Poland in the autumn of that year.

War put a very big stamp on anybody who was growing up. I suppose every boy in my high-school class was in the service. It was a big city high school, 350 to 400 people in the class. I was very active in my class. We were a multiracial school in that south side of Chicago. There were more Latin Americans—largely Mexican—than black Americans, but there was substantial minority representation. My good friend Lawrence Morris was the star of our basketball team, among other things. He was a good friend of mine.

It was a diverse neighborhood, but diversity was largely expressed in recent and not so recent immigrants. There were a lot of people who spoke a foreign language in their homes—Polish, Lithuanian. I think those were the two big smaller groups of Slavs of various nationalities, all of whom had come in the 1920s to get work. So we had a very diverse neighborhood. I ran for office and was elected. Then I went to college. I went to a school in Chicago—Central College—that nobody has ever heard of because it doesn't

exist any more, but it became one that everybody has heard of: It became Roosevelt College and then Roosevelt University. Central College was a four-year college, I got a scholarship and went there. My big hope was to go to the University of Chicago, which was really close to us in terms of neighborhood, but I couldn't afford that. So I went to Central and studied economics and political science. Those were my two fields. I started out in physics and enjoyed it, and probably would have stayed if the department had been better.

Central became Roosevelt at the end of the war. The president, whom I had come to know well, was a man named Sparling. He was asked by the board to furnish a list of students and faculty by race. He said, "We don't have that data and if we did I wouldn't give it to you." They said,

Edited and excerpted from an oral history interview conducted by Clarence Williams with Howard W. Johnson in Cambridge, Massachusetts, 19 November 1997.

“You’ve got to give it to us. We’re trying to raise money during the war to keep going here.” He said, “No, I can’t do it.” So he quit.

I went into the army at the beginning of 1943, and spent the next three years in the U.S. Army. I came out. I had hopes and expectations that I would go on to graduate work. I was admitted to the University of Chicago department of economics. I got my degree there. Then I was invited to join the faculty. I joined the faculty of the University of Chicago in 1950 as an assistant professor, when I finished my graduate work. I taught there, and assumed and expected that I would stay. Chicago had a strong economics department, has a strong economics department. I assumed that was where I was going to end up. Then one day I got a call from a man named Eli Shapiro. He was associate dean of the Sloan School. I knew him because he had been a professor at the University of Chicago, and had come to MIT in 1950. He said, “Are you interested in looking at MIT?” Well, I really knew of MIT but had no real interest in moving to New England. I thought I was a middle-Westerner. I survived in the mid-West. I liked the city of Chicago. I thought it was a lively place. I seemed to be getting along pretty well. So, anyway, I came to MIT and thought it was marvelous. They had more spark and fire here. It wasn’t only an academic place, it was a place that was interested in what was happening in industry. So, they made me an offer.

I was very much impressed with MIT. Chicago is a great university, but it’s very secure in the sense that it is a great university and in a sense a little bit precious about its history and its times—all of which isn’t bad in a university. It was a socially sensitive place, still is. I’ve had contacts there through the years. But I was very pleased because I was convinced that after the war—after my period of two years in Europe—I had seen so much destruction that I was going to get involved in something that would have an effect on society’s problems. I was going to get into the social sciences. I wanted to make a difference.

So that’s what happened. MIT made me an offer and I came here in 1955 as an associate professor. I became dean when Pennell Brooks retired in 1959. Then I was elected president in December of 1965 and took office July 1, 1966.

Back in the early days of the Sloan School, do you have any sense about your impressions of the environment, particularly with regard to race relations?

I think the short answer is that there was very little sensitivity to racial questions at MIT in general in those days. MIT’s by-word was, “Everybody is equal, this is a meritocracy,” although they didn’t use that word. “Everybody’s welcome, twenty-five percent of our students”—I remember hearing that—“are the first generation of their families to go to college; once you’re here we’ll try to help you through; what you do with your life is your business.” I would say the general tone and tenor in the 1950s was the difference in night and day from what it became even ten years later.

The Sloan School was, of course, quite a small school in those days. We had grown out of Course XV. Most of our students had high expectations of management careers. It was a male school. When they said to me that MIT was a school for men to work and not for boys to play, they meant men and boys in the gender sense. Not that there hadn’t been women at MIT from the beginning—we were very proud of Ellen Swallow Richards—but there were relatively few in management. Of course, I was almost instantly aware of it because it was not where I came from. But it’s a fact that that’s what it was.

Now there were minor changes, but I would say minuscule. The changes on the women’s front really began in the early 1960s. I found it curious that the size of our undergraduate class in women was limited to the capacity of a very small residence dormitory, something like fourteen. I’m not relying on data here, but it was something like that. While we had an occasional black American, typically they would have been people who would have had what I would call a privileged life, you know. I remember someone whose name doesn’t immediately come to me, but his parents had been in the diplomatic corps. I remember how impressed I was with him and I realized he had had a lot more opportunity than I ever had. He had gone to prep schools. He wasn’t my concept of somebody who had come up from nothing.

Some of the ones you had grown up with in Chicago.

No. My friend Lawrence Morris is long dead. He never went to college. Of course, only ten percent of my class went to college. That was about normal in those days in a city like Chicago. When I

went back to my fiftieth reunion, of course they looked at me as kind of an oddball. Most of them spent their lives in the mills—you know, marvelous people, but they led the life of what I would call the lower middle-class American.

You mentioned that period between coming from Chicago as a professor to coming here. During that period, there was a very major event in 1954 when the Brown v. Board of Education case came before the Supreme Court.

The major case.

Do you remember where you were and how that affected things around you at that time?

I do. Yes, absolutely. I would say the University of Chicago was very interested in questions of what I would call equality. In my own interest by that time, my thesis had been in labor economics. Of course, in Chicago we had a number of great industries. One was the meat-packing industry. The work force there, my memory of it—we're talking about an hourly work force—I wouldn't be surprised if it was about fifty percent black, and the other fifty percent were probably Polish and eastern Europeans who had just arrived. Many of these people had arrived in Chicago, as I said earlier, in the 1920s—both the black and the white work force. I spent a lot of time on work floors talking to those people. I was very sensitive to it. The University of Chicago had a substantial black cadre in the faculty and quite a noticeable number of black students. That was the character of that city, you know. It was a multi-racial city, very much so. I must say when you came to a place like New England, Boston was different from that in those days. Cambridge was different. It was a white city, by and large, as far as you were aware of it.

But I would say things began to change. Two massive things happened to America in the early 1960s. Of course, nothing starts out of nothing; it has to have foundations. There were two major things, one for the good and one for the evil. We began to get enmeshed in the Vietnam War by the mid-1960s, by the end of the Kennedy term, and we began to see deep involvement in that war, which is the one big thing that marred America's promise, I think, for a long time to come. And the other big thing was on the positive side. We had the Civil Rights Acts of 1964 and 1965, we had Martin Luther King, we had the beginnings of what we used to call at Chicago the vitalization of

the Emancipation Proclamation. That's what we called it.

Now that was beginning to happen in the country. I can remember I sat on our commencement platform beginning in 1959. I was a brand new dean and then, as now, the deans read the names of the graduates. I had no thought, incidentally, that I was ever going to be president of this great institution. If you had suggested that to me, I would have said, "You're out of your mind. That is not going to happen. I'm from a discipline from which we probably shouldn't draw the president." We probably should draw the president from one of our major core strengths of either science or engineering.

I can remember looking out over that commencement crowd and saying to myself, "We just have one kind of student here and he is male and he is white, and that's going to change." But it wasn't going to change overnight. When I became president, a major step had already been taken in terms of women, although the numbers were almost non-existent. But Jay Stratton, my predecessor—a great, decent man—and Jim Killian, who was the chairman, they had completed the arrangement by which Mrs. McCormick would provide for the funding of the first half of that building, the women's dormitory. The building was just coming on stream that fall that I became president. So the problem was the second half, which I worked on, and the middle joiner. Mrs. McCormick was still alive—a grand old lady, class of 1904. It stunned me to think that this woman could look at me and say, "Dr. Johnson, this institution had the greatest influence on my life and I want to help it." So she gave the second half for McCormick which we dedicated.

Anyway, even getting that going our admissions people used to say, "There are only a certain number of young women who are interested in science and engineering." Even after we began to admit them, and the numbers began to be noticeable, I remember somebody in admissions—a very serious person who had studied the problem—saying, "The maximum that we will ever get is twenty to twenty-five percent women. That's the maximum and that's way out because women aren't interested in our subjects."

So that had started. I was interested. I appointed Jerry Wiesner as provost. We appointed Paul Gray assistant provost in 1968, I believe.

Walter Rosenblith became associate provost and Paul got the assignment of greatly increasing our black enrollment. I believe by 1968 or '69, certainly by 1969—despite all the other problems, we had some other things to worry about in those days, of course, such as the war—we were admitting into the freshman class fifty students who were black Americans. We began that summer program, you know.

Project Interphase.

Yes, Project Interphase. I appointed a man named Jim Bishop, a wonderful guy. He was appointed, I believe, in 1968. I know we really had an all-out effort going on and I thought we were making headway. But then we had a meeting with the Black Student Union and they said, “You’re not making headway enough.” They couldn’t have been more right on that score. But then enters one of the great figures in this history, Shirley Jackson. I don’t know whether she was the head of the Black Student Union at that point, was she?

Yes, she was.

But she was the head of it *in fact*, with that wonderful calm voice of hers. We began to get some real results. The Black Student Union volunteered and took on going out and visiting high schools. They visited well over a hundred high schools. I’m just relying on memory here. I used to meet with Shirley and other members. Then some other things were happening that kind of set a pattern. I took a strong position in the Corporation on this matter. We had never had an African American as a member of the Corporation. I found that unbelievable. They said to me, “Well, who? Almost all of our members are MIT alumni. That automatically almost excludes blacks.” I said, “In this case, we have to go outside.” I fortunately had a good friend, Brud Holland. Does that name ring a bell?

Oh, absolutely. I knew him very well. He was my mentor at Hampton Institute. He’s responsible for me getting my Ph.D. and played a major role in many of my other accomplishments.

I didn’t know that. Well, I knew him because as president I saw him at Hampton. We had meetings on occasion. For some reason or another, we hit it off. He had been at Cornell and he had been a great figure there. He was a serious academic. So I asked him, maybe as early as 1967, would he consider becoming a Corporation member. And I explained, “We have an institution that does not

have a black member on its board.” I brought him on the board of Federated too—Federated Department Stores—which was a company that I was going to head, I suppose, at some point if I hadn’t become president of MIT. He was a very good board member there. So he came on at MIT and the year following I had come to know a man by the name of Whitney Young. Whitney was the head of the Urban League. Brud introduced me to him. I liked him immediately in terms of his real interest in education. The problem was he was getting asked by everybody by that point, you know. But he agreed, and he joined our Corporation.

So those were the first two people. And of course, there were many after that—very often young people because the other big thing that we did at MIT at that point was to put in younger people. It was a wonderful Corporation, but their average age was fifty-five plus and the median was probably about sixty. So how do you get young people to have a voice? We had, of course, turmoil all over and we had the representatives of recent classes. It always impressed me that almost every year the person nominated and elected happened to be a black American—it’s interesting to look at that list—or a woman, one of the two. And you could see why.

So we’ve had that. There was a black and we also had the first female member of the Corporation, Mary Frances Wagley. Then I became chairman of the Corporation in 1971.

When you were president from 1966 to 1971, that was a very turbulent time and as president you had to deal with some really, really tough issues—demonstrations and all kinds of things. Could you give us an overview of how you viewed each of these developments, particularly the ones relating to race? It was a tough period, and I don’t think there has been another president who had to deal with such tough kinds of things.

It was a terrible time in terms of people in the country. The interesting thing to me, as I’ve thought about it, nobody yet has written about that who was in a position of leadership in the American college and university. I’m trying to put together something now that focuses on that period. But as I thought about it, what I’ve discovered and thought seriously about is that the Vietnam War was the focus of much of that—and especially at a place like MIT where we had the two big laboratories and a lot of defense-supported research. We seemed to be a lightning rod,

along with all the other issues of inequity in the forces, the sort of imperialism that principled young people rose up to fight and resist. There were other things going on. The Vietnam War was the focus, but I'd say the second most important thing was the civil rights issue—the issue of equity and equality, a principle unredeemed that the country stood for. I was and am a strong believer in the American republic. I think it's the best and the greatest, but we've fallen short in vital areas, and the largest one is the question of the races feeling equal in terms of opportunity, equal in terms of share, equal in terms of self-regard, all those things.

So that was the second thing. And then the gender issue, the male-female issue—that's the third one. But then there were a whole lot of things that are kind of hard to put your finger on. We had a revolution going on in the social mores, whether it was music or whether it was all that other stuff that went on. I had forgotten all about it, but somebody was telling me about live theater or something like that. And, of course, we had the drugs issue in a major way. That entered American life for the first time. And then there was the sexual freedom issue—for the first time, the widespread introduction of the pill—that seemed to change the whole notion of you and me functioning as college administrators *in loco parentis*. You know, the sex urge is still the strongest urge that mankind and womankind have ever felt, and there it is when you get all these young people just coming out of adolescence.

So all those things were focused at once. You had to have a president, I believe, who could still keep an eye on the long distance but deal with all these things at once. I didn't do it all myself. I had awfully good people and we had a great faculty and a pretty wise student body, but you did have to have a certain amount of leadership involved.

No question about it. In fact, around the time of your inauguration, Jay Forrester wrote an article in which he described you as "an excellent judge of people," someone with "unwavering standards of integrity, fairness, and quality . . . and an innovative attitude."

I never heard that before. He's a tough judge.

Also, in a speech—which proves his point—you delivered to the 44th Annual Convention of the National League of Cities in August 1967, you took academia to task for what you called "its sense of isolation and aloof-

ness from human society and from the institutional obligations of citizenship." What, in your view, were the major failings of the universities generally and MIT specifically in this regard during that period of the late 1960s?

I tell you, I felt that strongly. That represents my views of the university. I think you could understand some of the reason for it. Everybody, almost everybody, had emerged from World War II with all of the terrible nature of all those parts of it and suddenly to find ourselves at peace in the 1950s. I'm trying to think of the justification for it, but the universities tended to retreat into the ivory tower. They said, "We'll study these issues." I thought the city was clearly beginning to fade around us. We began and we persuaded the Ford Foundation to begin major funding for the Harvard-MIT Joint Center for Urban Affairs. It had to deal with the city. We got the money for it—Nathan Pusey and I—and the issue was to be to study urban decay. I wrote into it the decay of citizenship as well as the decay of buildings. The Ford Foundation said that was a good idea, so they appointed a fellow that I had heard of but had never met. They proposed the appointment, and I said fine, of Daniel Patrick Moynihan as the first chair. And he was very good. He was excellent at it. And then a fellow named Bob Wood succeeded him when Pat went off to work with Rockefeller, I guess.

But I *felt* that, what I said there. I joined two organizations that I tried to awaken and in part succeeded. One was the National Action Council for Minorities in Engineering (NACME). I thought I had a special grip on companies. You know, I could talk to CEO's. They didn't over-impress me. I had seen many of them and they're outstanding people. They wouldn't be where they are otherwise, but they very often had blind spots and what I would call short-range vision.

Did you say you started NACME?

I was only one of many. I think there were maybe twenty of us. It had to do with opportunity for minorities. Then we had it funded and there was another organization called the National Fund. I don't think they exist any more, do they?

They still exist.

They do?

Yes, they do. It's still going and going very strong. And it has made a major difference.

It certainly was making a major difference, but I hadn't heard much about it lately. Anyway, those

were two organizations I was involved with. So when I said that to the cities, the reason I was invited to give that speech was because we had just given new life to the Joint Center for Urban Studies. I was invited to give the speech. I got a lot of criticism for that because the feeling was that the universities had no business in this area. But can you imagine this after John F. Kennedy had been assassinated in a city, Martin Luther King had been assassinated? Of course, that was 1968 and I guess you said the speech was given in 1967. But it was part of the same thing. And then Bobby Kennedy was assassinated: 1968 was a terrible year for the country, for every part of the country including the universities.

But I do feel that we were a stronger university when we emerged because we did have some direction and we did have some continuing management. I haven't ever said this before, but I've always been happy that the team that I put together continued and they've been in a sense involved—Jerry Wiesner and Paul Gray and several of the deans and people like John Wynne and Constantine Simonides. You know, they carried on.

Well, it's a very important point, Howard. You're such a quiet mover that a lot of people are not aware of the major decisions that you made during that period—decisions that have created people like Jerry and Paul, who have been very much involved in these issues such as affirmative action that we're talking about. But how they got there: They would never have gotten there, for example, if you had not appointed Paul as a young professor to be in charge of the Task Force on Educational Opportunity. And Paul admits it. He said to me that he's not sure that he would have been president had he not been appointed and involved in these activities to increase the minority presence on campus early in his career.

I think that's right. And one of our problems always is to pick people early.

You knew how to do it.

I remember watching Paul one day. He was chairing a committee and he has that—he had then—that sort of bull-dog tenacity if he believed something was right. And similarly, nobody would have picked Jerry because Jerry, who was my dearest friend and we worked very closely together for twenty years, had come back from Washington as a kind of golden boy, you know. He had floated around in the outer stratosphere and he had

strong, what I would call partisan political views, which of course is great, but because of it I would say that Jerry wouldn't have been chosen as a provost by most presidents. In those days, he tended to be very outspoken.

Well, you like people like that.

But I like people like that. Like Brud Holland. I remember Brud standing up in a Corporation meeting and he said, "We cannot go on this way in this institution." He was talking about scholarships at MIT. Everybody was surprised. It was as if to say, "Shouldn't you write that and send it in the mail instead of standing here?" No, Brud is somebody who's not appreciated here because he died too quickly for one thing. But also he wasn't appreciated, I would say, by the Black Student Union. He looked too successful to the black students. He looked like he was somebody's fair-haired boy. Well, he wasn't.

That's right.

He won every inch of ground like all of us have.

Well, it's interesting because both of you sort of came out of the same kind of background.

I don't know Brud's background.

Oh, he came from a very poor background.

Did he?

Yes. Oh yes, very much so.

I never realized that.

What were the most important new ideas and programs during your administration and what impact did they have on related ideas and programs as we know them today?

There's one program that had a very large impact on me before I was president. I was the dean of the Sloan School, as we've been saying. I failed on one score. One of the things that I wanted to do was bring some real-life experience to the faculty of Sloan. We systematically got the best new Ph.D's who had written the Ford Foundation prize theses as assistant professors. We were getting all those super-bright people, which we needed. We were refashioning the education for management. We changed the management school concept completely. We and Carnegie Tech were the two. But we weren't getting people who knew what the world was all about, so we began to bring such people. We appointed them at first, because of the system, as lecturers. They included people like

John Collins, the former mayor of Boston, because I wanted the people in that school—the seniors in the undergraduate part and the graduate students—to get a sense of what the city was like. We couldn't do it through our city planning department because they were more technical people—you know, city design. Many didn't understand the guts of what a city was all about.

We got Carroll Wilson. He had run a company and had been at MIT—a very distinguished guy—but I had never met him. Elting Morison told me about him. I called him and went out to see him. He said, “Well, I just sold this company and I'm kind of ...” I said, “You've got to teach a course on starting up a company.” This is the long way to answer your question about programs and what they've become. Carroll joined us and the first thing he wanted to do—and this is what impressed me—was to start the Fellows in Africa Program. We didn't call it that then, but he said, “There's a gap over there. The great colonies are removing their colonial leadership—French, British, both—and there's a gap. The leaders who have come up need bright young assistants who have modern ways of dealing with questions of finance and commerce and those kinds of topics that we teach here.”

So we began that, and over the period in which the program was going, we sent well over a hundred people who spent two years each. It was later called one of the designs for the Peace Corps. And it changed participants' lives, all of them. They all have gone into judgeships if they came out of a legal background, or International Monetary Fund, or World Bank, or college presidencies, things like that. That was about exposure to a set of problems that they couldn't have imagined, and that meant a great deal.

What we did when I became president, I tried to find programs—first of all, an absolute follow-through on the question of commitments to increased numbers. So that's how Paul became assistant provost. That was a big job in those days—it never existed before—this issue of expanding numbers of minorities in the classes. What he couldn't do, though, was deal with the question of faculty. We had a number of faculty members who were interested in that. Al Hill became interested and eventually I asked him to look at the laboratories.

Head a commission.

Yes, and he really became interested. He became very interested in black students who were interested in engineering. I don't know whether the record shows that, but he was very good at it.

It shows.

And he believed in it. We had others, but getting a faculty member—believe it or not—was tough in those days. We had another great man here. He and I often found ourselves on the wrong side of the table on issues related to the war, but he knew and I knew that we appreciated each other's integrity. It was a fellow, same name as mine—Johnson, Willard Johnson.

He's one of your first hires.

Yes, he was. Absolutely, but in political science. I wanted to get somebody in physics, in the core of the business. That was tougher. But a fellow—Ted Martin, who was in mathematics—was very helpful. I mentioned Al. Ted Murphy from the Campbell Soup Company, a member of the Corporation, said, “You keep saying in executive committee we've got to get more black members of the faculty. I've got a fellow for you.” I said, “Give me his name.” He says, “I don't have it, but I'll have it for you this afternoon.” When he called back, he said “Frank Jones.” Frank was a hot shot at the Scott Paper Company. He had come out of Harvard Business School. I called him. He said, “I'm perfectly situated to do a job here. I don't want to get into teaching. It's not relevant and I can have a bigger influence as an executive.” I said, “Maybe.” He came and we spent a couple of days together. I said, “Frank, I will hire you as assistant to the president.” He said, “I've been assistant and it doesn't mean anything.” So we got in touch with some people who were department heads, and Charlie Miller—head of civil engineering—said, “I'll give him a job as assistant director of the Urban Systems Laboratory”; it was engineering, transportation, and so on. Then he became, after a couple of years, full professor in civil engineering.

This was when you were president, right?

Yes, but Frank was a tough case because he didn't want to come. As I could understand, the world was his oyster. He was going to rise in that company without question. He was already a marketing manager. But I said this to Frank, “Do you want to go to your deathbed saying to yourself

that you were the biggest salesman of paper products in the world, or do you want to say you worked at one of the world's great educational institutions and made a difference in the lives of a lot of young people?" And he said, "Well, I'll think about it." We didn't have a job for him at that point, but we did in time.

And there were a couple of others like that, but we still haven't solved that problem. We've made progress. I hope a lot of people feel that way. There have been years in which I thought we were not [solving it]. But when I think of what life was like before—for a lot of people growing up in Chicago and especially if they were people of color—it was a miserable life. But I believe the country has made progress. There are a lot of people who are giving up on the question of whether we can ever be one society. I don't want to give up on that. I think we have made headway. You look at the data of incomes and so on, and we are making headway, but we certainly haven't made the progress that we should have made.

Would you have thought, when you look back on all the efforts that you made as president and directed the institution as chairman of the Corporation, that we would have made more progress than we've made now?

I believe I thought then that we would make greater progress. I was very hopeful because I'm basically hopeful. I think I'm an optimist by nature. I think of our students here and I would match our black American students as a group, those that I've seen, against any group from any university that I know of. I think they've been great. What I am sorry about is that they haven't had a bigger impact—that we can see at least, that you and I can see—on the people around them. The young men and young women I've seen recently, they go on to great careers, but I guess I was expecting too much. I thought each one of those people would influence a lot of other people, and I don't think that has happened. Plus, the society is very obdurate now.

But in answer to your question—should we have been further ahead?—Yes, I think so. Why should we have what we have in the board of regents at the University of California now, that great state taking the position that equal opportunity is not needed? We still need it. I believe the time will come. My hope was that when those laws were passed, I thought by the end of the cen-

tury we would have made real progress. That was my goal. I had two goals—one to live long enough to see the end of the twentieth century, second to see that issue resolved. I think that when you see that happening in California, it's a shame. That's the way I think of it. It's a shame. I think that there will come a time when we don't need it. Maybe it's going to relate to income or something, maybe it shouldn't be classified as a racial issue, maybe it should be in terms of income—white, black, Asian, Mexican income. If you get somebody like Jack Tang, who had three generations of great Chinese who had been here at MIT, the children, the great-grandchildren of the man who first came in and gave MIT the money for Tang Hall down here, they don't need any advantage. And your children and my children certainly don't need advantage. But, a lot of people still do and that's the way I sort of come out on it. But have we made headway on some things? I'm awfully proud of MIT in so many ways.

In a statement that you made after you stepped down as MIT president in 1970, you warned against the danger of politicizing the university.

Yes.

What did you have in mind overall and how, if at all, would you relate this comment to racial issues both at that time and since?

I did not have the racial issues in mind at that time. I was thinking of the upheavals of the university. In terms of the faculty, I was worried about it, even at MIT. I can describe it best through a student group that I met with at that time. This group said, "We need more strength at the national level to enforce equality." I said, "I agree with that, what kind?" Well, then they went on to describe it in terms of political parties. Of course, this particular group wanted a strong leftist party. This is the SDS group. They wanted, they said, to take apart the judicial system and create a people's court for crimes against humanity. In some ways you could say it was youthful fervor, but it wasn't all that because they were tough. They were throwing big rocks at that point.

It would seem as though I am saying that we should not take a position, but I believe that the university must take positions related to issues like equality. When I say equality, I mean equality of opportunity. I don't mean that everybody is at the same level. Obviously, we have to believe to a large

extent in meritocracy in the university. We're training and educating the best, but the corollary to that is opportunity has responsibility. You have to have responsibility to do your share, to bring the society along. We had vicious political fights at MIT and every other university during that period—largely, I believe, because of the Vietnam War. But then everybody got very politicized. After Nixon came in in November of 1968, it became more politicized than ever.

The other issue of politicization that I was concerned about was that we were getting to the point—and it certainly was true at Harvard—that if you had an unpalatable point of view, unpalatable to the crowd, you were booed and hissed off the stage. That happened many times. I think the basic tenet of the university is that it's a free society, you can speak your piece and get a hearing, and people give you a chance to give your views. I believe that political correctness is a big mistake. It's in that sense that I'm talking about politicization. I think that that in the long run would damage the university. It's like what happened in the great German universities, being politicized in the 1930s and pretty soon you had to be a member or at least somebody on the fringes of the Nazi or fascist movement. And there were signs of that in the 1960s. I think they've disappeared and that's pretty good, but I think they've disappeared because people like me and others were saying it was a danger.

In your annual report of 1968, you identified what you called "opportunities for the Negro" . . .

Is that the word I used?

Well, it was appropriate during that time. I mean, it really was.

Yes.

. . . as one of the urgent priorities of your administration. Absolutely.

How do you assess what you accomplished or failed to accomplish in this regard?

I failed in lots of ways, I suppose. I think we began some things—important things—and I think we've talked about some of them. I really believe that statement. It was a major issue. We were side-tracked, I think. I had thought that I would remain president for ten years, but I left after five for two reasons. I think I was just getting awfully tired and I think if I had continued I wouldn't be here today.

I was going to ask you that.

I was chairman for twelve years. That was the structural problem. Jim Killian had told me he didn't want to be chairman any more. He was sixty-seven, and in those days you really looked at sixty-five as the retirement age. I asked him to stay on two extra years. So the question was, if we had had the wrong person as chairman, it would have been a mistake for us. So, I was asked would I take the chairmanship. If I had known who was going to be the chairman, I would have stayed as president for a little longer. But it worked out. I was a very strong proponent of Jerry Wiesner succeeding me, and then Paul Gray being positioned in that administration so he could follow if he continued to perform, you know. It's all dependent on good luck and high performance. Life is a very touchy thing.

You are a very quiet person, but on the other hand you're very much like the people you like who are tough. For example, that decision to appoint Jerry was not a liked decision, as you well know, with him being Jewish.

Absolutely. Those issues were even, in a sense, more strident. Then, when I appointed Walter Rosenblith as associate provost, I used to get mail from alumni on both issues. I wouldn't call it hate mail, but strongly critical mail. It's just like one fellow once said to me, when we had students in my office occupying the office. A rather well-known alumnus said, "Why don't you go in and get them out of there? If you have to use bayonets, use them, but you may not know anything about that business." And for once I got very annoyed. Fortunately, my mother taught me never to lose my temper, but I came close to it that day.

I would say that our faculty in general had seen more of the real world than most, at least in my experience. That doesn't mean that we didn't occasionally have a faculty member who hadn't. One said to me once, a rather distinguished faculty member, during that period, "I'm not going to give a student C, I'm going to give them all A's because if I give them a C they might be drafted and they might go to Vietnam and die." That's a tough one to deal with. I said, "Well, you've got to grow up. You're a professor trying to help that man develop. Is the best way to help him develop to shield him from the world? There's no way. You can't make that judgment." And a term later he said, "I've thought a lot about it, and you're right."

But that was part of the distortion of the time. Everybody had these tremendous feelings of guilt. Curious times.

If you had any advice that you would offer to outstanding young black people who aspire to be in our domain, whether they be students or whether they be faculty members, what advice would you give them if they were considering coming to a place like MIT?

That's a very serious and good question. The problem with advice is that we draw from the experience in our own lives and that might not be appropriate for the young person you're talking to. But what I would tell her or tell him is something that had an influence on me. The trouble is that when I say it to my sons, it doesn't quite communicate the way it hit me. Here's what it is. I attribute it to Abraham Lincoln, who still is my great president. What he said was, "I will study and prepare and some day my chance will come." He said it in a different way than that, but that's what it meant. But it sounds—coming from an older person, I think, to a student—kind of axiomatic, not really realistic. But I believe it is realistic for a college-level student. I believe they've got to get a hold of their ideals and I believe they've got to prepare and get as much involvement in the world as they can, because they will get a chance.

I've always enjoyed it when I met with black students in years past. And I would say, but I know it didn't go across, that they would have great opportunities, they really would have great opportunities, and everyone that I've known as an individual has that great opportunity and has gone on. I could see these young people who had been on the Corporation, women and men both, have far better opportunities than you and I had. Part of it, though, you have to tell them, is luck. You need some good luck and you have to love your parents and all those things, but the best thing that you can control is to prepare. I don't think that goes over too well, but it's the only thing you can control.

You have had all of the experiences at this institution, you've seen it from bottom to top, you've orchestrated it in so many ways. When you look at it in the present time, in 1997, if you had your magic wand, what kinds of things would you think you would do to enhance the experience of blacks at the Institute?

I think we're doing a lot, but somehow I don't think we're doing enough. One thing I've been very strongly for—and I've written about it to

Chuck Vest and to others—is that we've got to create a better living situation here at MIT. I'm talking long-run. You can't do it right away. But I think if I had my magic wand, you say, I'd use it for one thing. I believe under the circumstances maybe it was a mistake. I wasn't the only one. When Jerry Wiesner felt strongly about it, and Joe Snyder felt strongly about it, we bought that so-called Simplex land. My hope was that we could create what I'd call the dormitory looking on the city of Cambridge, a place where our students—especially undergraduate students; not necessarily graduate students, they're already more mature, but our undergraduate students, the seventeen-, eighteen-, nineteen-, and twenty-year-olds, which after all is pretty young—would find a community in which they could see the city but also were part of this community where they could associate with each other and associate with more faculty. I had this in mind and we never had the opportunity to go very far with it. But I often felt that if we had Mr. Sloan alive at the time, we could have persuaded him to build some housing for faculty where our faculty could be closer so they could see the students in off times.

We have achieved a diverse student body. Look at our student body. I've sat, I think, on every commencement platform since 1959, and that's nearly forty years. You look at those faces and it's no longer white males. We have a wonderful, I think, reflection of the modern American society. Maybe that's true of the faculty, but to a lesser extent. But we certainly are getting women and in time, I believe, we will have better diversity there. At the present time it's not, but it's getting better somehow. I'm not sure what your reaction to that would be.

Well, it's not in terms of black faculty.

It isn't.

No.

I was going to say, it isn't in terms of black faculty.

We have about fourteen black faculty members.

Is that all?

Yes. It's less than twenty.

But we had more than that in 1971, I believe, maybe fudging a little bit on visitors.

You had just as many then as you have now. It's very close. I mean, it's such a small difference.

I didn't realize that. But if we had places where the faculty first of all were comfortable with each other, that would be a big help. You know, that's part of the problem too there. They drive in, as I did. But I had the best experience after I moved on campus. I lived on the campus as president and chairman and then for all my active years up until the last two. We had the land to build faculty housing, and now that opportunity, I believe, is gone. There had to be some battles fought with the city, but I think they could have been won. We had some pretty good support lined up.

But I think that's what I would do. You can't change the faculty overnight, but you can change the environment. And I believe that's what I would focus on. It doesn't sound very important, but in another ten years it could make a huge difference, I believe, don't you think so?

Well, I think so and I think it's important to understand your view on this because it's a very timely one. We're talking about housing our students now, for example, in terms of whether a freshman should stay on campus and be required to do so. Dealing with the issue of housing and where people stay is what you're saying, if I understand you correctly.

Absolutely. I believe we are going to teach that whole range of issues. In a practical way, people can be together. And I don't want to exclude them from the city, you know what I'm saying? I want to have that. Let's say, suppose we could raise a hundred million dollars? That would go a long way. Focus it on that issue, the way men and women—faculty and students—are going to live together. When I was the dean, we had the Sloan School Building. Of course, it was then called the School of Industrial Management. But we got Mr. Sloan to put up the money for that, the next building, and then cleared out some of the old junk all the way down. And it made a big difference. It made a big difference in the way people treated each other.

I do believe—and this will betray an old-fashioned thing in my life, and it isn't appropriate now—I think it would be better if our society was a little more civil toward each other. You know, my mother was a very good mother as most of our mothers were. I'll tell you this little story. You will appreciate it, I think. We were walking together on our way, I suppose, to church or some place together and a man I knew in our neighborhood,

who was a black American, came up. He said, "Hello, Mrs. Johnson." She said, "Hello, Mr. so-and-so," whatever his last name was. I said, "Hello, Bill," and when we got out of range she took me—not by the ear, she never I don't think ever laid a hand on me—in a way that got my attention. She said, "Howard, I never want to hear you call him by his first name again. He's your senior and you'll call him 'Mister.'"

Boy, did that make an impression on me. Now that's what I call a civil society. I was no more than eight years old. I had no business. He was a kind of fellow who was a handyman in the neighborhood. I knew him; he was a very nice guy. But she was right, she was right. I've never forgotten it.

I can really appreciate that. It says so much about why you are who you are.

Do you remember the baseball commissioner who spoke at our commencement a few years ago, the former president or acting president of Yale? Then he became the baseball commissioner?

Yes.

Quite a guy. I never knew him except when he appeared and spoke to the students. We walked in the procession and, sitting there, you make small talk. We're talking about that and his experiences in New Haven. He said that it was a small point with him, but he said the level of conversation that he hears when he goes back to the campus now makes the ballplayers look kind of civil to each other. He was talking about the students. But the question of respect for your fellow human being—innate, honest respect—how do you teach that? I don't know how to teach it, except mothers saying to their brat child, "I don't want to ever hear you say that again." And boy, it made a difference in that neighborhood. It did make a difference.

Well, obviously it has made a major difference in terms of how you have dealt with your career and how you have had such a tremendous effect on a place like MIT. Well, we should have done more, but it's a great place to be and I'm glad you're there, I must say. May I ask you a question too?

Sure.

In the same line that you were just saying, what could we do in terms of our black students that would make this a better place? What you've just said about the numbers of faculty, is there any hope of improving that?

Well, I think there is possibly hope, but I do believe that we as an institution, Harvard as an institution, and some of our other great institutions are going to have to have people who will stand up and actually make rules—contrary to what the times suggest one should do—to show that you aren't in agreement with the way things are at the present time. When I think about some of the people whom you actually selected during the late 1960s and early 1970s, these were people who had what I call guts. Yes, that's a good word for it.

I frankly don't see that. I don't see that at a time when I think we really need it, when we have a conservative kind of mood.

This is the time you need that.

This is the time when you need to not talk it but show it. That is, there's nothing that sounds better than to be able to just put it out there and people see it. This is what I believe in. I think we're doing that to some extent with women—and we still have more to do there—but I don't see that we're doing it well with blacks.

But it's much easier. The women thing is going to come, you can see it coming.

But when we look at two particular areas at the institution, I think we should be able to deal with them in a way that we don't have to talk but just simply show by our actions. One is that I think that we have a large group of Asian students and our population of the Asian faculty is growing to a certain extent. You should be able to see that representation through our administration as well. I say the same thing for African Americans. We should not be in a position where we do not have, say, a legitimate person in the main structure of the institution. Absolutely, a real core position.

We've been at it since you started this task force, since 1968, and we have only had one black person who was a senior officer. This person was Shirley McBay. We haven't had anything in that arena since she left. We have not, faculty-wise, had but one black who has been the head of a department, and that was Phil Clay, in urban studies and planning.

Yes. Is he is the only one?

He is the only one. There are still departments that do not have and have not had an African American as a faculty member. I think we have to do some things.

I don't believe we have one in my own school. When I left the Sloan School, we had had several, but I'm thinking now.

You just had the first tenured faculty member in your school from last year. He was promoted to a tenured position. His name is William Qualls.

Oh yes.

The last one you had was Phyllis Wallace.

Phyllis, I brought.

Yes.

I brought her from Yale as a professor, and she deserved it. She was in my old field and I knew all about Phyllis.

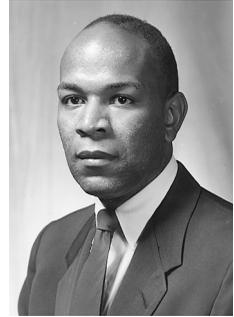

But when you look at the people whom you brought in yourself and look at what has happened since then, you would be hard pressed to see much progress. It's not as though there hasn't been an effort from the leadership view, or wanting to have the effort, but there is so much left to be done.

But I used to say in this field that intentions don't matter, it's results that count. I'm aware of all the problems. I chaired the mathematics visiting committee. I volunteered for that job. This was back some years ago when I left the chairmanship. Mathematics was the toughest department when I became president. We had some splendid people there who took the position, "You don't want to bend any requirements." All the litany—"It does no good to bring somebody here to have to flunk them," and all that. I knew enough about math to know that it's an academic subject like any other academic subject. What those people were reflecting to me—including a great man, a friend of mine now dead, who said, "We Jews had to fight through discrimination, we had to fight"—was in a sense saying, "Let everybody else have to fight through the same battle." If you told him—I'm not going to mention his name—as I did, "Sure, you fought that battle but there were a lot of people with you," and these fellows were coming through one at a time, he didn't go with that.

During all those years that I was chair, every time we raised it—it was always part of the agenda—once in a while they could come up with somebody but the person wouldn't last very long. And their answer was, "There's nobody in the pipeline." The next question is, "What are we doing to help the pipeline?"

JOSEPH R. APPLGATE

b. 1925, BS 1945 (education) Temple University, AM 1948 and PhD 1955 (linguistics) University of Pennsylvania; appointed to staff, mechanical translation project, Research Laboratory of Electronics, MIT, 1955; assistant professor of modern languages, MIT, 1956-1960; director, MIT's new language laboratory, 1959; assistant professor of Berber languages, University of California at Los Angeles, 1960-1966; associate professor of linguistics, Howard University, 1966-1969; professor of African studies, beginning in 1969; director, African Studies and Research Program, 1967-1969; executive producer, "The African World," WHMM (PBS), 1987-

Let's begin by talking about your family and early education—where did you live and go to school?

For one reason or another, I found myself in elementary school advanced two years beyond my age level. I'm not sure exactly why that was except that I did know how to read when I started school and had learned that at home. I knew how to write, so for one reason or another they said that I didn't belong in first grade. As I went along, somehow I got another year because they did not have semester timing but full-year timing, so any time you skipped something you were a year ahead. Of course, later that was not a real advantage, I thought, because it meant that I was always physically smaller than other students. My family wanted me to go to college—that was instilled at a very early age. We didn't have much money, so the idea was scholarships and at that point we were thinking in terms of athletic scholarships. Since I was physically smaller, I always ended up unable to make the team. Even cross-country running, I remember undertaking that with the idea that I would become a member of the team and perhaps get a scholarship on that basis.

For various reasons, we moved from the small town of Wildwood, New Jersey, to Philadelphia. My parents had a small boarding house in Wildwood. I learned a great deal there because they did not cater to the usual summer vacationers, but to entertainers. The environment included people like Duke Ellington, Louis Armstrong, and some other people of that type. It meant that these people were around, with a very sophisticated, urbane manner. I might wake up at night

while Ellington was running through a trial run of his composition or something he wanted to present at the next performance. I didn't realize at the time what all of this meant, but it did have a great deal of influence on the way I looked at things.

When we moved to Philadelphia, our neighborhood was South Philadelphia, which was essentially a blue-collar, working-class neighborhood mixture of ethnic groups. The first languages I learned outside of school were Italian and Yiddish. Just because these were spoken by people in the neighborhood, you learned them on the way to school. (Incidentally, the current president of Howard University also grew up in South Philadelphia. In talking recently, we found that we had learned the same foreign languages under similar circumstances because the neighborhood had remained a mixture, with very large Italian and Jewish populations.)

I found in senior high school that an athletic scholarship was going to be out of the question, but my family and I did find out that an academic scholarship would be possible. So I set out to get one. When I was a senior, I was offered a tuition scholarship by Howard, there was another school I forget, and a third one at Temple University. Because of the economic circumstances and so on, we couldn't afford to accept the tuition scholarship at Howard because it would have meant paying additional fees and housing expenses. So I accepted the one at Temple.

I graduated from high school when I was fifteen and started as a freshman at Temple at fifteen. I needed some additional financial aid. I remember very clearly on the day of my sixteenth birthday, during that first semester as a freshman, waiting at the financial aid office applying for a

job on campus. I got one in the university library—not in the standard stacking of books, but in the book bindery. So I learned how to bind books, which was very useful both because of the craft and also because of the environment. There were some older students there and the atmosphere was generally one of working and discussing different things about classes and courses. It was just an interesting environment intellectually.

Tell me a little about your mother and father.

My mother was from Virginia, my father from New Jersey. Both were rather sophisticated people, but without formal education. Neither had finished elementary school, as a matter of fact, but they were determined that my sister and I would. That was something that they instilled in us. Another important thing that I got from my mother and father was how to deal with the concept of race, which they considered a tool that might be used to repress us, or keep us from doing everything we wanted to do. I remember hearing as a child in Wildwood the idea that things in Wildwood were somehow better than in a lot of other seashore resorts in New Jersey because there was no segregation. I didn't know exactly what segregation was all about—but it was the idea that the beach should be open, you could go anywhere, and therefore you should not purposely choose one spot above another. Examples of Atlantic City, Asbury Park, and so on were given as the wrong kind of beaches because they were segregated: if you looked a certain way, then you had to go to a specific part of the beach. My sister and I both were instilled with the idea that this was unacceptable. You should never let a person's appearance determine where that person would go as far as the beach was concerned or school or anything like that. At the time, I guess we didn't fully appreciate that.

The other thing was that when you answered questions on certain applications, certain forms, there would be a question—race. We were taught either to leave that blank or to put U.S. At the time we didn't—well, I didn't—fully understand all of this, but my parents were rather insistent on that. Some people would want to say “Negro” or “colored,” but no, that was unacceptable. We were “American.” My mother's father and my father's father were Native Americans. My grandmother's

mother—that is, my paternal grandmother's mother—was also Native American. This was considered important—American Indian at that time—and so this whole idea was instilled at a very early age.

Could you come back to this unique experience on the undergraduate level? It's in the same city that you grew up in. What were the highlights of your experience at Temple University?

I mentioned the whole business of working in the bindery of the university library. There were other things that were pleasant. I was still anxious to convince myself and my parents that there was some athletic ability, so I went looking for an opportunity and ended up on the fencing team. I do remember the pleasure and pride in getting the varsity letter in fencing. My father was very pleased that I had finally gotten a varsity letter. I had gotten a letter at the senior high school level for membership in the honor society, but that really didn't count because it wasn't a full varsity letter. But at the college level, second year, I became a member of the varsity fencing team and continued that membership until I graduated. Fencing is not a commonplace sport, but I was very glad to get that letter and my father was glad that I had finally made it.

An additional experience came through the program I was in, in the School of Education, secondary education, where we had to have coursework in fine arts. One of the courses I took, Modern Dance, led to a great deal of interest in dance. I had been interested in dance at an earlier age, but this was a formal introduction to modern dance and I continued working with that through college. At the end I had reached a level in dancing where I was able to audition for the Katherine Dunham troupe in my senior year, when I was getting ready to graduate.

There were several things that were happening at that time. This was during World War II. I had been granted a deferment, then an extension of that, until the last couple of months of senior year when I got a notice—“Report prepared to leave because if you pass the physical on that day, since you've had all of these deferments, you'll go.” So I went around, got all my exams taken early, everything seemed to be all tied up, went to take the physical, questions included any illnesses—well, hay fever. This was at a time when the study

of allergies was just getting started or reached a high point and then, “Oh, you have hay fever, you mean you’re allergic to something. You’ll have to come back tomorrow for all these patch tests that we do: skin tests.” I guess the procedures were not as effective or as efficient as they are now, and I seemed to be allergic to about fifty substances. They said, “Well no, we don’t think we want you in the Army.”

Now, I’m not sure about all of the things that were involved in that. I mean, there were the allergies, yes, but there was also the fact that the end of World War II was just about there. This was May 1945, just about the time of the bombing of Hiroshima. I think probably there had been a decision that the military would be more selective with those they chose. So I got sent back, and I was very disappointed because I had told everyone on campus that I was leaving. I had told my instructors I had to have those exams early. Everyone had cooperated, and then here was the real situation where I got sent back. So that was not too good. But it was after that that I did the audition for the Dunham troupe and I was told, “Yeah, you can join us.” I thought about it and said, “Now what should I do?” I was, I guess, nineteen at that time, and I decided it might be better to take a more stable position in the Philadelphia public schools. So I started teaching in September of ’45. Later I have wondered about that. Maybe I should have joined that Dunham troupe.

You mentioned that you started teaching after you finished college. How and why did you choose the field? What caused you to major in whatever you majored in? Well, I majored in secondary education. I was in secondary education in the College of Education at Temple University, with the idea that I would teach in secondary schools. You had to have a subject that was being taught. I had started learning Spanish in high school, so I continued and majored in Spanish. Then just to make sure that I would have alternative fields, I did two minors—one in German, one in English. So I learned German and studied more English and English literature, all of that, during the four years in college.

So languages were really your domain, so to speak.

Well, yes. I had majored in Spanish and minored in German and English. There were not too many people who studied German. Somewhere along the line I had learned that if you have control of

something that is not a general product, commodity, or service, you had an advantage.

So it was after I graduated that I got the position of junior high school teacher in Philadelphia. Then there were salary differentials between junior high school teaching and senior high school teaching or vocational school teaching. At first I moved into vocational school teaching of English, and then I said I wanted to get into senior high school teaching. Now that was the first real racial conflict, I guess, because I was told Negroes were not accepted for senior high school teaching. I said that was unfair, and furthermore it did not apply to me because I did not accept the classification of race and if there were any doubts about ability then they should take a look at my score on the National Teachers’ Examination.

Now, I don’t know whether I should admit this or not. The National Teachers’ Examination was required, at that time, for teaching in various areas. Philadelphia did require it; at Temple, they arranged for graduating seniors to take the exam. This was during the early days of computerized examinations. I and some others had worked at the idea that if this is going to be scored by machine, there had to be a program—a set of patterns—and if you could figure out the patterns then you could take the exam without too much difficulty. That was what I did with the National Teachers’ Exam. Using this technique of saying, “Well, I’ll get a set of questions that I can answer here”—because it was a two-day exam—“but if I can get a set in this section of the exam, check and make sure the pattern is correct, then I can use that pattern throughout without doing any more work.” So I had really taken the exam with a minimum of effort. The concept was valid, the procedure was correct, and I ended up with a score that was nearly perfect without really reading more than, I would say, a third of the questions. It just seemed perfectly natural at the time. It was only later when I started working at MIT with computer science that I realized what I had really done. But at the time it seemed the natural thing to do. After all, I wasn’t going to spend all those two days sweating over that exam.

But anyway, I made that statement to the board of education and there was some consideration. I applied for the position of teacher in senior high school. Because of social changes that were going on at the time, another teacher and I

became identified as the first two Negro senior high school teachers in Philadelphia. And because this was considered revolutionary more or less, and because of my age, I was assigned to teach at an all-girls school, a senior high school. It was not an academic high school but a commercial high school, which meant that the students were not very—what shall we say?—restrained or proper. Some of them were about a year or two years younger than I, and there were all sorts of questions about how I would relate to these students. During the first year of teaching, both the other teacher—Dr. Hayre, a woman who taught English—and I had visits just about every week from people observing what we were doing. Of course, they were especially interested in what I was doing because of the age and the gender relationship and so on. Of course, they found nothing wrong. I got annoyed with it, and I think that was part of the reason that I worked with the teachers' union and helped unionize, really, the public schools in Philadelphia. It was just sort of rebellion.

How did you get from there to working on your doctorate? I wanted to go on with further language study. I went to the University of Pennsylvania and was able to take courses on a part-time basis. What happened there? During the last year of college, and then with the interest in union activities and so on, I met some people, one especially. He and I became quite friendly. His father, Samuel Putnam, was a translator. He did the definitive edition of *Don Quixote*, a translation from Spanish to English, but he was also a member of the Communist Party. He had been the editor of the magazine *New Masses*. His son, Hilary Putnam, and I became friends because of this common interest in labor activity and so on, and he said, "Why don't we do this graduate work at Penn? It would be interesting." I said at first that I would continue with the work in Romance philology, but that was extremely dull. We met Zellig Harris, one of the founders of American structural linguistics, and both of us started working in linguistics. Hilary moved from linguistics into philosophy. Let's see, has he retired from Harvard yet? I don't think he has, but for a time he was a faculty member at Harvard.

So that's how the graduate work in linguistics started. I got a master's degree. One of the reasons, of course, for getting the master's degree was the

salary differential. I think at the time it was about three hundred dollars or something, so I got the master's as soon as possible and continued working with Zellig Harris in linguistics. It was interesting, the study of *language* rather than specific languages. I met a lot of interesting people: Dr. Watkins, an anthropologist from Texas who had done a study of the Gullah language off the coast of South Carolina, and American Indian languages. I was especially interested in American Indian languages because of my family background. All of these things were mixed together. Now I wonder if that really did have an influence.

You mentioned Harris. What people up to this point—while you were getting your advanced degree, college as well as high school, with the exception of your parents—stand out very strongly as role models and mentors in the process up until you got your Ph.D.? Were there people you thought highly of or who had a lot of influence on your career?

That's hard to say. There were my parents, and they had provided the basic foundation. Now, role models, that would be hard to specify. The idea was simply that you keep moving forward and, okay, people like Zellig Harris were important people, people like Dr. Watkins were important. Zellig Harris was chairman of linguistics at the University of Pennsylvania. And there were other people in linguistics I'd talk to, who were interesting and presented interesting ideas. Of course, there was that interest also in what would now be called left-wing activities, so I met some people with the Socialist Workers' Party. I mentioned Samuel Putnam. He was a person also who provided, I guess, some ideas not about leadership, but just this was the way you could develop a career.

Let me say too that interest in political activity started at a very early age. This is another area where my parents were important because they had worked with the Republican group in Wildwood, in South Jersey where I spent my early childhood. At that time, people did not have baby-sitters, therefore my sister and I were taken to a number of political meetings. I guess I learned the U.S. political organizational structure from direct observation as a child. This was the way elections were organized, these were the things that people did prior to the elections, this was how people talked. And that did have an

influence later. All of these things, I guess, are important when you stop and think about them. I think basically I can say, at the time because I was in my twenties, I wasn't really analyzing background influences and things. I mean, this was the way the world was and a lot of significant things were happening at that time. Let's see, in the '50s, of course '53-'54, the Supreme Court decision about Brown versus the Board of Education and all of the arguments that went with that, I guess that had a great deal of influence.

Where were you at that time?

I was in Philadelphia, and I was teaching at that senior high school for girls. I had convinced people that I should be teaching there, that I wasn't doing anything improper with the girls in the student body. I was working also with the graduate program at Penn, doing a couple of courses a semester. This did have a great deal of influence. I was in a discipline—linguistics—that was just getting started, and I think that was important because the atmosphere in linguistics was very different from, let's say, the atmosphere in Romance philology. There were only two or three faculty members in the linguistics department, all of them engaged in basic research and all of them presenting their courses really as seminars about what they were doing. Now, Zellig Harris was married to a woman who was a mathematician and an assistant or associate of Einstein. This is how I got an idea about what the academic world was really like at the university level.

How did you happen to come to MIT?

That was part of this relationship between linguistics at Penn and machine translation at MIT. Zellig Harris and Victor Yngve had developed some kind of relationship that made it possible for Harris to say, "Okay, somebody is getting a doctorate at Penn in linguistics, do you have a place for that person in your machine translation project at MIT?" The answer was usually yes, so there had been a steady movement of new Ph.D.'s from Penn to that project at MIT. Fred Lukoff had been there, and Leigh Lisker. So it was natural again when we got our Ph.D.'s that this would be the job we would move into, and I was looking forward to that. Two of us got our degrees in 1955, Noam Chomsky and I. We immediately moved into positions at MIT, and part of the position for

me was teaching German as well as working on the machine translation.

So you were actually teaching German at MIT and working in machine translation?

Yes, I was in the Research Laboratory of Electronics. Jerry Wiesner was director, Norbert Wiener was down the hall.

They were pioneers, as you were.

Well, when I think about it, this is where I can say that that experience in the book bindery at Temple and the informal discussions, and everything else had sort of provided the orientation for work at the universities. I do recall at MIT informal conversations with Norbert Wiener, you know, just almost as casual as the time of day—but later, "Oh yeah, where did I pick up that idea?" And that was the way people worked in those days, and like I said, the work at the University of Pennsylvania had been done in more or less the same way.

I had done my work at Penn, you know, on a part-time basis until I got to the stage where I had to do a dissertation. There was again the relationship of that department with the ACLS, the American Council of Learned Societies. They were doing an extended project on African and Asian languages and providing fellowships for people to study and describe various languages. I was able to get a fellowship to work on one of the Berber languages—Shilha. And that was what I did my dissertation on, the Berber language of southern southwestern Morocco. That provided a basis for two years' leave of absence from the Philadelphia school system, while I worked on my dissertation, collecting data from a native speaker in New York. The fellowship provided the funds that enabled me to spend three days a week in New York and four days a week in Philadelphia working on this research. I came out with a structural description of Shilha as the dissertation.

Then I went to MIT. I was working on German and had just about forgotten all about Berber until, let's see, after about four or four and a half years at MIT on the translation project, when we came to the conclusion that it would not be possible to develop a computer program for machine translation because we could not accurately describe the process of translation. Until we could provide a complete description of that, we couldn't really write a computer pro-

gram. But of course I had learned a lot about computers and information systems during that period, abstract theory, more or less from the informal discussions with Wiener and comments from Wiesner. I had learned a great deal. I finally submitted a proposal to what I think was the government agency that would now be the Department of Education. I wanted to do a study about language acquisition, because I had become interested in the language of children. I did an article on that and wanted to continue with it. I submitted the proposal, got a notice that the proposal had been rejected, felt rather cynical about it, and said I'd find out why.

The answer I got when I talked to the program officer was, "Well, in looking over your c.v. we see that you have some experience, you did some doctoral research that might be more interesting and we'll get back in touch with you in a couple of weeks." I guess I said to myself, "I've heard that one before—here we go again, is this going to be the Philadelphia school system?" But a couple of weeks later, I did get a call saying, "Would you be interested in ...?"—I forget the order in which the questions came—but it was basically, "Would you object to moving to LA? Would you be interested in a position there and would you be willing to work on Berber?" And I said yes, I would agree to all of those, and shortly thereafter the formal offer came. A position had been established at UCLA in the Department of Near Eastern and African Languages. The terms were consistent with what I had been paid at MIT. I would be able to teach Berber languages because there was no one in the country at that time in that field.

No one was teaching it?

No.

So were you the first to teach it?

Yes, to teach any of the Berber languages. The position started with a year in Morocco to do further work on Berber. So I was able to live with a group of people in the Riff mountain area. I learned not only the language but also a lot about the social life of the people, the cultural description. It was really an interesting experience.

Do you have anything that's written up about the Berber language and your teaching of it?

What do I have? I have the doctoral dissertation, and then there are various things that I did in connection with the description of Tamazight, the language of the Riff people; the description of Kabyle, the Berber language of Algeria; and, of course, there were original teaching materials for the courses that I taught in Shilha, Tamazight, and Kabyle.

Before you left MIT to go to California—because you actually had a better job, so to speak—describe how you actually became an assistant professor there and your overall experience when you think about MIT, what you actually experienced there.

One of the things that I did become involved with at MIT was the whole business of electronic equipment for language instruction. There was a local firm there, General Electronics, that had developed an electronic system to be used in what we now call language labs. I worked with them because I was interested in acoustic recognition of speech sounds. That was part of the whole process of developing the system. In working with this, since I was teaching German, I was able to test some of the equipment as it was developed in the German classes. Then MIT decided to purchase one system that I was able to work with, and I was very interested in this. They made me a consultant for the firm and I went around talking to people about how the system worked acoustically and so on and encouraging adoption of the system—not exactly selling, but more or less providing the necessary information for making a sound (no pun intended) decision about this system. Then I went out to UCLA.

In regard to that consulting, were you an assistant professor at that time? You came there as an assistant professor. Did you get any sense of how you were accepted at MIT as a professor?

As a member of the faculty, I don't think there was any hesitation about acceptance. Certainly in the Research Laboratory of Electronics there was no hesitation. Everything was open. It was just, this is the way things were. Everyone was working on something significant, so there was no reason to hold back on anything. Certainly working with that electronics firm more or less reinforced the idea that if you had something to do, you went ahead and did it. That was outside. It was consulting, but connected with the university position.

When you got the offer to go to California, did you sense that MIT wanted you to stay and, if so, was there any offer on MIT's part to try to keep you there?

I could not say yes or no to the question about the university keeping me there. What had happened with the machine translation project was that we had reached this point of saying, "We don't think we're going to be able to do this because we can't describe the process of translation." There was a certain—what shall we say?—not feeling of depression or anything, but sort of, "Do we really want to continue in this area?" And I think Dr. Yngve was trying to decide whether he would go on with the project or not. Noam Chomsky was saying he thought he wanted to go somewhere else, and then this offer came for me to go to California. So I said, "Maybe I'd better go somewhere else."

That was a normal pattern for that project. Fred Lukoff, whom I mentioned earlier, had been there and then he went out to Wisconsin. He had worked on Korean and was going to continue working on Korean in Wisconsin. Leigh Lisker had been doing significant research in acoustic phonology, and he had gone to work at Bell Labs. So going from MIT to another location seemed part of the normal course of events. When I got this offer to go to UCLA, it seemed to be the logical next step.

How long did you stay there and what did you do?

At UCLA, what did I do? I started with a year of research in Morocco because they said, "Well, you've worked on one Berber language, now we need work on another." So I went and collected the data, then analyzed and came up with the description of Tamazight that is spoken in northern Morocco. I had a wonderful time in Morocco because I wanted to learn not only the actual sound patterns and so on but also the features of social situations in which the language was used. I had a very good time working on this and then came back to UCLA. Let's see, I stayed five years in Los Angeles. Of course, there were students that came through especially to study Berber, because that was the only place where instruction in Berber was provided.

That's because you were there.

Yes. I did train a couple of students who moved into linguistics departments in other universities. Jeanette Johnson Harries went into linguistics at

Wisconsin and there was another fellow, James Deas, who went to Michigan State, I believe.

So when you left California you went where?

Here, Howard University.

And what year was that?

That was 1966.

You came to Howard University in 1966. Tell me a little about all the things that you have done since you have been here in terms of positions you've held and the things that you've done.

One of the factors in my coming here was the connection with the electronics firm in Cambridge and with MIT, where I had worked with them in improving the language laboratory equipment. Dean Frank Snowden, from the College of Liberal Arts here at Howard, was in Los Angeles considering purchase of this equipment. There was a theoretical base for it and so on, and he talked to me and suggested that if Howard purchased the equipment, would I be willing to come and serve as director of the language laboratory? Now, that was back in 1965. Howard made the formal offer in 1965 and I said, "Well, all right, but if I come I want certain things guaranteed." It took a year to get the negotiations straightened out. I came as a professor in Romance languages in 1966—by that time we had concluded everything—with the idea that I would be director of the language laboratory. They had purchased the system that we talked about. I said okay, got here, and started working with the language lab equipment and so on. That was when the man who was director of African Studies decided to leave Howard. They needed a director and they asked me if I would do it. This was with the advice of Dr. Watkins, whom I'd mentioned earlier, and I said okay. I left Romance languages and came into African Studies, and that was that. I never got out of African Studies.

That was in about what year?

That was that same academic year. It was shortly after I came here. So I never really worked extensively with the language laboratory system. I was sorry about that later on because a lot of people did not fully understand the system. Basically, we were working with the concept of an electronic classroom. Now that has been developed in a much more sophisticated way; at that time, it was new and different. The idea was that you could use

electronic equipment in a classroom situation with thirty students, listen to each student in turn, and make comments. There were ways to make sure that you tuned in on the right student at the right time, heard enough of his response to decide whether he needed a comment or not, and what the comment should be. But this seemed to be an ordinary process at that time.

How many languages do you speak and understand?

My usual answer to that is one, English. But I have worked with the Berber languages, about seven or eight of those. I guess the last field work that I did with one of those was when I did the work connected with the instructional material for Tamazight, the language of the Tuaregs, for the U.S. Peace Corps. I spent a summer with a group of Tuaregs going from northern Niger to southern Libya, because they were a migratory people. I learned about the Sahara by traveling across that area with this legendary group. They are called the “blue people” because they use cotton cloth dyed with a blue dye and they wrap themselves completely in it. I found that, in the Sahara, you have to do that because actually you’re in an area where the soil—or what corresponds to the soil—consists of fine particles of silicate, in other words equivalent almost to ground glass. When the wind blows and the ground glass hits your skin, you could be cut to pieces if you’re not wrapped in this blue material. The dye in the blue material is not stable. It rubs off on your skin, and this is where the concept of the “blue people” comes from.

By the way, how many countries have you visited in your career?

Oh, I really don’t know.

What about a broad view of the continent and different parts of the world?

Well, let’s see. In Africa, a number of countries in the north and west—well, all of the north African countries, many of the western countries in Africa, and southern Africa. I’ve not had an opportunity to visit much of the east. Countries like Ethiopia, Uganda, Kenya, and Tanzania I really have not been able to visit for any extensive periods of time. I’ve been in Tanzania for a very short period of time.

Which one have you enjoyed the most?

Morocco. And then in Asia not much. During the war over there—which Yemen was it, Northern or

Southern, the one that the U.S. was supporting?—I went as a person who could speak Arabic, and that skill was needed at that time for getting certain things done. I’ve gone to Europe, of course, but I never found cities like London or Paris interesting.

About what year was that?

Oh, I guess I was here at the time, so it must have been after 1966.

Based on your own experience, what advice would you give young people like yourself coming into the academic world in order to be successful in what they do?

Well, I think probably, most importantly—and this may sound trivial—do not let other people define what you are going to do. You have to make that definition yourself. Don’t always be looking to the traditional academic patterns for approval. In other words, if you’re considering a course or a project or something like that, it does not matter whether it’s been done before or not: If you are convinced it’s worthwhile, go ahead and do it. It can be improved but it has to be started, and that’s the important thing. It’s better to work with things that have not been fully exploited than to say, “Well, I know this is done at Stanford or MIT or wherever, so it’s alright.” No, we will set the tone of what we do and just go on from there.

See, the idea I think many people at an institution like Howard have is, “Well, we have to construct our programs to meet the criteria established elsewhere.” And I say, “No, we will get the programs started and other people can adopt them if they want to. If not, then too bad, they’re the losers.” I know some of my colleagues have trouble with that, but I still think it’s rather important. And the fact that this department is the only one that has a complete program in African Studies from undergraduate major through Ph.D. is a very significant point for Howard. This is the only institution that has it.

You actually started this department?

No, I didn’t start this department.

Administratively?

No. Administratively, they had a department and the program offered a master’s degree. Then I was able to come in as director and convince people that we should have a Ph.D., in other words that the department should be the base for a discipline.

Well, let me put it differently. You actually administratively started the first Ph.D. program in African Studies here at Howard? That's correct, right?
Yes.

And that's significant. Otherwise, this program would not be what it is today.
That's possible.

You encouraged them to bring in the undergraduate program as a part of the overall program.
Well, that was much later.

But it was under your jurisdiction.

No, I was no longer director at that time. You see, after I got the doctoral program started there were questions about, let's say, my point of view and whether I was African enough. That got into it, and I said, "Well, I'm not going to be any more African than I am."

Could you say a little more about why people thought that you were not "African enough"?

Well, that was the period of intense interest in

Africa, the desire to identify oneself with Africa. This was on the part of students who said, "Well, you're just not a real African." And I said, "Well, I'm not supposed to be." There was a little conflict there about whether this program, the African Studies program here, was essentially a program for American students or for people of African descent. Of course, my position was that this is for American students. That was the basic objective: to develop researchers who were Americans to deal with research on problems of contemporary Africa. Sometimes I think that objective was obscured by all the energy directed toward African identification. Howard is essentially an American institution and a pioneer in American higher education.

Is there any last statement you'd like to make? I think you have said a lot, and I really appreciate the time you've taken.

What final words?

Yes.

Keep moving.

Professor Applegate with students in the new MIT language laboratory, 1959. Source: MIT Museum.

GUSTAVE M. SOLOMONS, JR.

BArch 1961 (architecture) MIT; interior architectural designer, Barbara Dorn Associates, 1962-1963; dancer and choreographer, a leading figure in American postmodern and experimental dance; soloist with the dance companies of Donald McKayle, Martha Graham, and Merce Cunningham, among others; founder and artistic director, Solomons Company/Dance, 1972- ; artistic director and dean, California Institute of the Arts, 1976-1978; faculty, Dance Division, Tisch School of the Arts, New York University, 1991- ; visiting artist and lecturer at many universities; recipient, award for excellence in television, PBS, 1968, for "City/Motion/Space/Game."

I grew up in Cambridge, halfway between Harvard and MIT, on Inman Street. I loved school. Kindergarten year I had tonsillitis. I was out of school a lot with sore throats, so I had my tonsils taken out. After that, from the first grade through the twelfth grade, I was absent only one day. I was very proud of that. There was nothing I liked better than going to school. I was smart because I didn't know that I wasn't supposed to be. Actually, I was the salutatorian in high school. I was first in the college course, but a girl in the commercial course—the secretarial course—had a higher average. So I was salutatorian.

But anyway, that all changed when I got to MIT. I had never gotten less than a ninety on a quiz in high school. Well, at MIT, I never got above a sixty. I would get, say, twenty-three on a physics quiz and think, "Oh my God, I'll have to go to BU and study music education." I was sure that I would not make it through my first year at MIT. But at MIT they graded on a curve.

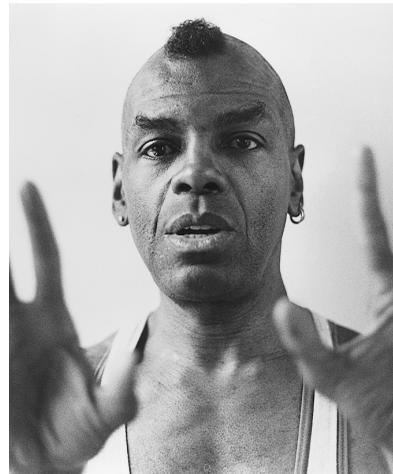

That was a tough year?

"Oh! *Physics?*" I knew $e=mc^2$, but it was high school physics. I didn't know how to think, I didn't know how to really solve problems. I knew how to memorize. I had a photographic memory. I could memorize a script the first time I'd read it. That's how I got through high school, I just memorized everything. I still know all my lists of prepositions and helping verbs and all that stuff.

Well, at MIT you had to think, you had to know how to solve problems. That was a big revelation and I never really learned how to do that,

I have to admit. I still memorized the formulas. There was a wonderful guy who had been an MIT professor and who had gotten fired for some kind of ethical slip-up, so he had set up a little store front across the street from East Campus where he would tutor. This man was a brilliant teacher. He made his living by charging five dollars to the students to get boned up on the quizzes that were coming up—physics, chemistry, and math. I was there every week, and he would give us the formulas that we needed. I would memorize them and do the quizzes. I would still get a twenty-three, but at least I was higher than enough others that I didn't flunk out.

Physics got interesting fourth semester. I enjoyed mechanics because I liked to put things together and build stuff, so that was fun. And nuclear physics, the fourth semester, was exciting

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with Gustave M. (Gus) Solomons, Jr., in New York City, 20 March 1996.

because we had graduate assistants who would teach us what they were discovering in the laboratory that morning. This was nuclear physics! I had no idea what they were saying. I don't think some of them really did, either. A lot of them, of course, were foreign students who didn't have a real good grip on the English language, so we couldn't understand what they were saying anyway. But then we would go across the street at East Campus and learn the formulas we needed.

But my upbringing before college was normal—grade school, high school, college preparatory—and I was interested in theatrics. I did a lot of children's theater. In high school I was in the drama club. Ever since I was a little kid, I liked performing. I did that as a major hobby, but my father—you know, MIT man, electrical engineer—"What are you going to do for a real job?" It was assumed that I would go to college, so I applied to Harvard and MIT and maybe Yale, Princeton, and Carnegie Tech. But there wasn't a question I would get into anywhere I applied in those days. Then, MIT had five full-tuition scholarships for Cambridge residents. Harvard didn't have anything like that. They gave me a scholarship, but MIT's was full tuition.

So I said, "Okay, I'll go to MIT." The way I selected my course was—and this is embarrassing, so maybe I shouldn't tell you—that I didn't like to read. I looked through the catalogues when it came time to choose a college to see what courses probably involved the least reading. And I thought, "Well, architecture—that looks a little artistic, that might be kind of fun, making models and drawing things. I guess I'll be an architect."

That's how you decided?

That's how I decided. I was not a mature sixteen-year-old. Actually, I was kind of young because I had gotten into school early. When I graduated high school, I was just barely sixteen. So I went into MIT early.

Before you go on to MIT, could you talk a little bit about your father and mother and family?

They were great people whom I didn't get along with all the time as I was growing up, because I was spoiled and willful. My mother, I think, secretly enjoyed the fact that I performed. She really supported my little recitals and plays. She had done some theatrics at church. She liked to sing and she was in plays. My father was, in a way,

the prototypical MIT product of his day. He was very involved in what he did, his electrical engineering, and he was smart as a whip.

He came to MIT when?

He graduated in '28.

He graduated in 1928, and didn't he do some things that are on the record now?

After school? Sure. He worked at Bethlehem Shipyard for his whole career. He had one job. Then they sold out to General Dynamics and he retired. During World War II, he was doing defense work, building ships. When he retired, he ran for school committee because he was active in the community.

We lived in an Irish Catholic neighborhood. There were one or two black families, but it was mostly Irish and Greek and Italian and Portuguese. Those were my friends growing up—no black community at all. My parents were of a generation that was aspiring to assimilate, and that was the ethic with which I grew up. We were solidly middle class. There was enough money and everything. I had whatever I wanted and more than I deserved. I got all the toys I wanted. I wanted a chemistry set, I wanted a magic set, I wanted a bicycle, I wanted a skateboard and skis. I got them all.

Where were your parents from?

My mother was born five blocks from Inman Street on Union Street. She lived in three houses her whole life. One was on Union Street where she was born. She moved into Inman Street next door to my father's house. She got married and moved next door. About my father's family, my younger brother knows all this stuff because he asked. I never sat down and said, "Okay, tell me the story." My father's family is from the Dutch West Indies, from Aruba. I don't know how my paternal grandmother and grandfather got together, but at some point they lived on a farm in Brooklyn. My father was brought up on a farm in Brooklyn and at some point moved to Cambridge.

You mentioned your brother. What was his name?

Noel. He's six years younger than I am.

Now, is he the one who was a professor in nutrition here at MIT?

That's him. That's my brother.

I knew I knew that last name.

My father went to MIT and I went to MIT. They wanted my brother to go, but he went to Harvard to be a doctor. Actually, he went to Harvard to be a biochemist. Then he came home one day and said, "Somebody just discovered what I was going to devote my life to," and he switched to pre-med and became a doctor. Then MIT got him finally after he graduated.

Where is he now?

He's in Guatemala. He's a genius down there.

Is that where he always would go each summer?

No. He went to Peru and to Colombia—Cali—and to Nicaragua, I think. When he started getting into his nutritional research, he was doing it down there. He was getting in touch with Latin America. I think it was around the time of the earthquake in Guatemala that he went. He was there cleaning up after the earthquake and he started a clinic. I don't get all this history straight, but now he is the head of the clinic that is run under the auspices of the Hospital for Eyes and Ears. It's called CESSIAM—The Center for Sensory Impairment and Aging and Metabolism.

He really loved going and doing that kind of research. I think everybody at the Institute knew he was outstanding, but he didn't want to play the politics involved.

Right. He got out of this country because he hates everything about the way this country treats black people. I saw him. I went to Guatemala on the Tour from Hell in June 1995. The reason I went was—I was a little suspicious about the whole arrangement—that it was a chance to see Noel. That was really terrific. He has an adopted Guatemalan boy who was the son of one of his assistants at the lab, and this woman and her husband were shot by the guerrillas. He adopted their son. It turns out her sister is his housekeeper, so he and she and his adopted son and her daughter all share a house.

So all three of you, in one way or another, have been associated with MIT in very unusual ways.

Yes. Well, my father's way was the most usual, I guess, because he belonged there. He was smart enough to be there. I guess it was unusual then because he was so rare, being a black person. I was there by accident. I really wanted to be in show business, and that's what I did most of the time I was there. I did Tech shows forever. I got an award for doing Tech shows.

So this was when you were an undergrad?

Yes, I was moonlighting. I would study dance at night after my first year. I was in the Tech show the first year, and then I decided I wanted to go and study modern dance. So I went at nights and studied modern dance.

And you went to one of the best in the area. When you think about MIT, your undergraduate program, what are the highlights for you, whether they were ups or downs? The highlights? Academically, design was great. I enjoyed the creating and the way it was taught. I had no idea what to expect. I thought we would learn about the orders of Greek columns. The second year, after that awful first year when we all had to do physics and math, we got into the studio. There were drafting tables and they brought us in a piece of paper with a problem on it. They said, "Solve this problem, build this thing." That's how we learned how to do it. That part was great and the people, my classmates, were also wonderful. Some of them I'm still in contact with. They were good.

There was also something about that wonderful old building that I liked a lot. I have dreams still about the octopus, Building 7 and all the way down to Building 10—that endless, endless, endless corridor. God, what a piece of planning that was! And the ironic part about the drafting rooms is that the architects are behind this monumental stone façade, so they have no windows. I spent an awful lot of my time across the street at Kresge, of course, doing drama shop and Tech shows. I guess the drafting room and Kresge were the best things about MIT for me.

Did you have any role models or mentors that stand out in your mind during that time? Any faculty?

No, I had kind of crushes on various teachers. I remember Marvin Goody was our second-year architecture teacher. He was six-foot-six. I was six-foot-three in those days, now I'm six-one-and-a-half. He was very tall. And there was Bill Bagnall, who wore hand-knitted socks and Marimekko ties and had one of those bony, gaunt faces, but was extremely sexy. Women couldn't stay away from him—men either. I don't think he cared, but in 1958 you didn't talk about it. He had a little round domestic wife and a lot of girlfriends. But I didn't really identify with any of my teachers. Certainly there weren't any black people at MIT.

Do you recall how many blacks were in your class?

In my architecture class, there was me. In my whole class, my entering class, I can't remember. There may have been a half dozen, but I don't think so. I think there were a half dozen women. I don't remember. Maybe there were one or two other blacks, but I think they were from Africa—foreign students. I was not aware of race in those days. I identified with everybody that was around me.

You say you weren't aware—do you have any sense about when you did become aware?

Yes. When I came to New York I had to learn how to be “colored” because I was in a show. At the first rehearsal, they gave us a step. It went duh-duh-duh, Free Twist! And I said, “What? Free twist?” I knew Chubby Checker's twist, but they started and I looked around amazed and said, “Whoa! What is that?” I had some trouble “getting down.”

Actually, I have a good friend now who was in Tech shows with me then who recently said, “You know, Gus, there was a lot of discrimination around you that you didn't see.” I was completely oblivious to it. She recalls an incident in a restaurant, Ken's at Copley. We went in to eat something and this waitress was evidently very rude to me. I was simply unaware of it. My friend said that, as we were going out, she went and read the riot act to that waitress. But I was just oblivious. I was happy and I was having a good time. I saw my goal, whatever it was, and I went for it. I was really oblivious to any kind of discrimination or racial hatred.

At home we didn't deal with emotion. My mother was always happy and my father was always neutral. I didn't have any real emotional interaction with them. I used to get mad, but it wasn't real anger. I mean, we didn't deal with anger. It was just a tantrum and then it was over. So I never learned how to deal with emotion or how to perceive it in other people. I also never learned how to be who I was. Part of that had to do with striving. My self-worth came from the approval of other people, and I really knew how to get that approval. I was always special because I was the only black in whatever situation I was in, so I was not a threat to them. I was treated specially, I guess, because I was different, and I just thought I was being treated specially because I was terrific!

Finding out about being black happened when I came to New York and had to get an

apartment. We went through the regular routine of reading the *Village Voice*, and going to the apartment or calling up and saying, “Is the apartment available? I'll be there in twenty minutes,” and arriving and having the landlord say, “Oh, we just rented that one.” I would think, “I told you I was coming. What happened?” After a while, some of my friends from the show began to point out, “Gus, get a clue.”

So I started to get a clue. That was 1961. Then came Kennedy and the Civil Rights Act, so things got better. I didn't realize they had been worse, but they got better. For me they were good, and everybody started getting along. Then the shit hit the fan when Nixon got into office, and then Reagan tacitly made it all right to hate again. Since then it has gotten worse and worse and worse.

You do think things have gotten worse?

I ride a bike, and it doesn't matter what I'm wearing, if I have my helmet and walk into a building on 57th Street to a dinner party as a guest, it's assumed that I'm the delivery boy. I don't even get angry anymore. Just the fact of being a black man anymore is an automatic threat to certain people.

The other day, I was going to my chiropractor. A woman and I were waiting for the elevator. The elevator came. I got in and she hesitated. Another man, a white man, walked into the elevator and then she got in. I know if he hadn't shown up, she would have waited for the next one. By now I'm sometimes bemused and sometimes frustrated by it, but I'm never really angry because I don't want to deal with anger. I enjoy what happens when I'm thrown into a situation with a bigoted stranger and they have to talk to me. As soon as I speak, they realize that I'm not a criminal or whatever they thought. And a kind of exhale happens, “Oh! A real person!”

I know you did something significant in terms of architecture at MIT not too long ago. You did some work in one of the lobbies. Could you talk a little bit about that? You mean dance work? I danced in the lobby in '73. We did a couple of lobby installation pieces in '73. I guess I was an “illustrious alum” at that point. I said, “I'd like to do some dancing for you,” and they said fine. I don't even remember the mechanics of it, but it was easy. Then we went back and did it again.

I'm just writing an essay. I had to look it up because both things happened in the same year,

'73. I had done some stuff in Boston at WGBH as well. I did a big video piece. I was still well known in Boston.

Now, have they offered you to come back to, say, be a visiting lecturer or something like that?

No. And MIT just eliminated their dance program. That particular program, I think, was the wrong program for MIT. But if that's an open option, now is the time. The media center has all this potential for doing wonderful things with dance, and I don't mean having classes for recreation and fitness. I was on the president's visiting committee for the arts and humanities for several years. Unfortunately, I almost could never make the meetings because of my schedule. But the one visit I did make was discouraging because at MIT still, even though the community is now much more in evidence than it was, the arts are still kind of bastard step-children, except maybe music. But it's chamber music. Come on! Bright scientists who can play violins? That's not what music should be doing at MIT, you know? Geez! And dance, the same. I think the visual arts probably are using the technology more effectively. I'd like to work with the media center on exploring the interface between human motion and technology.

As a matter of fact, Sandy—who was the head of architecture, Stanford Anderson, is that right?—was in contact with me about something totally else, a team architectural project that we did when I was an undergrad that he wanted to get some information about. He didn't even know I was an alum or a dancer. Something may happen there, but I would like to do something at MIT.

I know we have a person who is an associate provost for the arts now. The woman who first came there four years ago to hold that position is Ellen Harris. She came from the University of Chicago. She has done a wonderful job. She has developed this resident artist program.

When you think back on your career so far, where did you get all this creativity? I'm trying to find out where you got these ideas.

I just didn't think I couldn't. Nobody said you can't be whatever you want to be. I'm starting to feel that now. I am going through mid-life crisis and all that stuff. I look at the dancers coming up. My dancers, those guys, what they can do technically is just so far beyond what was even possible when I was coming up. The performing opportunities that are available for me now are fewer than

they were, than they used to be, partly because I'm older.

I'm supposed to be "established," which means that I should have now a superstructure. I should have an executive director, a board of directors, a this and a that. But if I had done that, I would now simply be out of business. I would be broke. I consciously kept my work on a small scale so that I could have the freedom to experiment, to do a piece with radios, say, in a museum instead of a piece that could be presented in a conventional theater. I've been fortunate in that a lot of people know me in the field and I have students now who are hiring me for residencies and commissions.

I got this job full-time at NYU in '94, and that's a mixed blessing. It's full-time, it has benefits, it has a health plan—I've got to think about that—but it won't let me have my time. I mean, I'm in trouble for taking two weeks off now to go to VCU, Virginia Commonwealth University, because there are things that I have to be doing here. There are times like this, winter break, when I can arrange to be off from school and not miss out on any duties. But the chair—and I can certainly understand it—doesn't want the full-time faculty not to be there. We have the whole summer off and a big break in January. That's true, but you can't always plan your life that way. I'm seeing whether I can adjust. It's a one-year contract, a renewable one-year contract, so I'm not bound. It is the best job in the world. Being a full-time faculty member at the NYU School of the Arts is a plum job. Everybody wants it.

What makes it that?

Because you can be in New York with a full-time job dancing, teaching the best students around. We have our pick of the litter. We auditioned three hundred and fifty students just this past spring.

For how many spots?

For something like eighty. Of those eighty, we'll take maybe thirty. So there's no teaching job that is better, but no tenure. They know they can get away with it. I'll take it because it's a good job. I was an adjunct at NYU for two years before this position came open. I just applied as a formality. Things snowballed and suddenly I had the job if I wanted it. I said, "Oh, okay." I had never had a full-time job before.

You've always been independent?

I've always been a freelancer, yes. But I'm fifty-seven, the body doesn't work like it used to, and you start thinking about how much you can do.

How do you keep yourself so fit? Is it dancing that did that?

I guess. In fact, I started doing gym ten years ago. I never did lift a weight or thought about lifting a weight or any of that aerobics stuff. Ten years ago I started doing that just to keep toned.

So that helped you?

Yes, a whole lot. It doesn't matter how many dance classes you take, you don't get the same benefit that you get from doing weight training and aerobics. It's different and it's necessary. When you're young, you can get away with not doing it specifically. But now even the young dancers are doing it, and that's why they're so great. I'm still keeping my options open. I still have not performed as much as I want to in my life.

I worked with Martha Clarke. Do you know Martha Clarke? She's one of the MacArthur "genius grant" recipients. The reason I got this mohawk hair-do was to do a piece of hers. She did *The Magic Flute* a couple of summers ago. I was the deus-ex-machina character. I loved working with her. It's a way of performing that I don't have to choreograph. She's doing *Marco Polo* right now. That I would have been able to do if I had not been at NYU full time. So that shows you.

Did you also work a little bit with Alvin Ailey?

No, Donald McKayle. There were several of us—the black dancers—back in the '60s and '70s who danced with Donny and Alvin, or one or the other. I enjoyed working with Donny because I felt his work had more choreographic substance than Alvin's. Donny's still at it.

Let me come back just a little bit to the MIT experience. You had a special time when you were there, but if you had to summarize and analyze your perspective on your MIT experience, how would you do that? Then I want to ask you what advice you would give to young blacks coming to MIT, based on your experiences, not only at MIT.

I would summarize it, I think, by saying that the education—the training that I got at MIT in architecture—combined with the discipline I got in dance at the same time, made it possible for me to design a life that I have enjoyed without ever having to "get a job." I think the knowledge com-

bined with the discipline of working, not because someone was saying do it, has made my life as successful as it has been.

I think the advice I would give to anyone entering MIT is to learn who you are, while you're learning what you want to be doing, because it's the understanding of who you are that's going to allow you to use the knowledge that you acquire. That's what makes wisdom. Knowledge is not wisdom. Information is not knowledge. You get lots of information at MIT and if you know how to process it, you get knowledge. Then, if you know who you are with this knowledge, you become wise.

As I said earlier, I think you are unique. I think you'll find that when we put it together, you'll see some very beautiful people who have come out of MIT like yourself. At the time you came through, you were unique. If there's anything from any perspective—either your job experience, MIT, anything else—you think you would like to put on record, please do so.

I wish I were rich and famous.

LUCIUS P. GREGG, JR.

b. 1933, BS 1955 US Naval Academy, SM 1961 (aeronautics and astronautics) MIT; served in the US Air Force, 1955-1965; associate dean of science and director of research coordination, Northwestern University, 1965-1969; program officer, Alfred P. Sloan Foundation, 1969-1972; vice president, First National Bank of Chicago, 1972-1979; corporate vice president for strategic planning, Bristol-Myers Co., 1979-1983; vice president and director of national public relations and government relations, Citibank, 1983-1987; vice president for public relations, New York Daily News, 1987-1989; staff vice president for corporate communications, Hughes Electronics Corp., 1989-

When I look back, I now realize that I came to MIT at a time when the country as a whole was going through profound and unprecedented change. It is startling. We were entering a period that would change so much—from the balance of power in the world, down to even our lifestyles and attitudes. Over the past forty to fifty years, we have seen more change—in science and technology, in military power, and in social justice—than for any other comparable time in this nation's history, and maybe in all of history. Only today can we realize how fortunate we now are to have been a part of it.

I now realize that, when I was a graduate student, we were entering a period in which our efforts would result in America's undisputed leadership in both technology and military power. At the same time, the social agenda having to do with equality was being raised to a new, more painful and contentious level. My life symbolizes the convergence of all three.

I sit here today, a kid from Chicago's ghetto, because many Americans, rich and poor, powerful and powerless, decided that the way things were was not how they were going to be, and that we—MIT included—decided that we all deserved a better deal. I came out of the Naval Academy in 1955. I was the fourth black to graduate, but the first to graduate with what they called "distinction," in the top ten percent. I ranked high enough that I was able to choose the Air Force. Then, when I ranked pretty high in terms of pilot training, I was able to pick the Military Air Command, and after a year and a half, they promoted me to aircraft commander.

Once again, I was the only black in that group. I had my own crew at the age of twenty-five. The Air Force was letting their first group of first lieutenants fly with the rank of aircraft commander. Prior to that, you had to wait until you were much older before they let you have your own crew to fly military families and government officials back and forth to Europe. I did that for three years, flying once a week to Europe.

During one of these trips I remember—on October 5, 1957—I was waiting that morning in the hotel lobby in Paris with my crew to bring a return flight of passengers back to the States. I picked up the Paris newspaper as a way of staying fluent in French. The headline read, "Russians Launch Sputnik, U.S. Sends Troops to Little Rock." A chilling moment. America's challenges both internally and externally were then raised to new levels.

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with Lucius P. Gregg, Jr., in Los Angeles, California, March 1997.

I then applied to the Air Force to go to graduate school. After reviewing my undergraduate records, they said, "Okay, you have three choices—Illinois, MIT, or the Air Force Institute of Technology." I opted for MIT, for the graduate program in aeronautics and astronautics, and graduated in 1961. There was so much going on then in science and technology, in addition to the national security concerns of the Cold War. That certainly kept us at MIT focused.

I would say that my coming out of MIT stood as a symbol to some of the other not-so-pioneering technical institutions. The symbolism said, "Wait a minute. If guys like Lu Gregg and others are coming out of MIT, what's our problem?" That's why I think that I was able to go to places like Northwestern, where I was associate dean of sciences. I was able to sit in their faculty meetings and the deans' meetings, and speak. Having the MIT credentials gave me an element of credence and credibility. I hope MIT does not underestimate the role that it played in that early period.

I recall a program on public television last year on the life of A. Philip Randolph, who preceded Martin Luther King. What it talked about was his role from the 1940s and '50s into the '60s. The A. Philip Randolph story has also caused me to look back and realize that, when I was at the Naval Academy and MIT, it was really the beginning of very profound changes in our society. On the military side, there was the whole notion of our national security. On the technology side, there was this little thing called an electron. We started to find out all the things that we could do with it, and what it could mean in terms of benefits.

During the same time, A. Philip Randolph was beginning to meet with President Truman and, later, President Eisenhower. It was interesting to listen to that one-hour PBS story on Randolph's life. As they laid out the chronology, I realized that what I was seeing and feeling was a whole movement taking place in terms of civil rights. We were feeling it. Even though I came up within the scientific and the military arena, you're still aware of all the struggle and soul searching that's going on outside of science, in the realms of the nation's social policy and civil rights. It does really affect your day-to-day activities. It, too, is a part of your daily life.

You couldn't live in Boston, Washington, or elsewhere without feeling it. All these things were

taking place at the same time. In the 1950s, when I was in the Naval Academy, the Washington train station had a "colored" restroom. One of my classmates was selected as an All-American football player from the Naval Academy, but I did not go when Navy played in the Sugar Bowl in New Orleans in 1953. The Naval Academy got special permission that if I wanted to go to New Orleans when Navy played in the Sugar Bowl, I could sit with the midshipmen and I would not have to come out of that group and sit separately where the blacks were sitting in the end zone.

In Washington, the whole Baltimore-Washington expressway was built by President Kennedy in part because the African diplomats traveling back and forth from the UN to Washington couldn't stop on U.S. Route 40 and buy a hot dog or use the restroom. Every time they did, they were told they had to go to some outhouse someplace. That created an international incident and was one of the things that motivated the federal government to build that expressway, so your travels could bypass that whole area.

Because of changes in the scientific and military communities, they were beginning to promote minorities and create role models at the same time that civil rights activists were raising questions more vocally outside. To some extent, some of the questions they were raising externally kept us focused internally and made us a little more dedicated so as not to fail. I see now that we were opening doors so that others could follow us.

Every day presented different opportunities, challenges, and threats. Once I was called to fly the Kennedy White House staff from Palm Beach to Martha's Vineyard. I'll never forget the time I was Strom Thurmond's personal pilot on a VIP flight out of Andrews Air Force Base, flying him to Columbia, South Carolina, on July 3, 1963. He thanked me when he got on and when he got off. But the next day he blasted the civil rights movement and switched to being a Republican. Nor will I forget the time, while driving to Palm Beach Air Force Base, that I was stopped on the highway outside of Ft. Pierce, Florida, handcuffed, put in a patrol car with a shotgun to my head, and put in a lineup at the police station because I looked like the guy who had robbed a store and kidnapped the white clerk.

So much change was going on. None of us thought at that time that the changes were going

to be so quick in coming. Even considering the role of the electron itself as an element of matter, no one envisioned what we were beginning to wrestle with, what you could do with this thing called an electron. Science was getting into the most minute parts of matter. Every day brought new discoveries, but I suspect that few realized that this was part of a technological revolution and that we would look back thirty or forty years later and say, "Wow, I was a part of that!" and look at the amount of change.

I remember sitting in the graduate course at MIT. First, there were few textbooks. The knowledge was changing so rapidly that the purple copying machine outputs were the lecture notes of the class. One time they asked one professor, "Each year on the exam you keep asking the same questions. Aren't you afraid that the students are going to cheat when they write the answers?" He said, "No, because the answers keep changing."

And the second thing is, there were twenty-five of us military officers there who had been sent to MIT to get our graduate degree. Sitting beside me was Buzz Aldrin, who would later become the second astronaut to step on the moon. This was a course on automatic control of aerospace missiles. The professor looked up at the clock and said, "Well, I've finished what I'm going to cover today but it's too early to let you go this soon. I have to keep you at least another five or ten minutes. I don't want to start the next subject. I'm going to hold that until next time. Let me just spend some time telling you about this new form of computing that we're doing. It's called 'digital.'" We reached for our notes and we started looking up to see how to spell it. This was 1960. And he said, "It's like a combination of zeros and ones." I remember in my notes drawing the line. But we had no idea that we were on the threshold of something that was so profound, that was the beginning of the digital revolution that has changed the world.

We were in this live-or-die situation against Russia. We didn't know at any moment what would happen. When we would take off out of New Jersey and fly to Europe, one of the first things that the military had us doing was looking down to report Russian submarines that were sitting in the Atlantic off the United States. This was in the late 1950s. It was at the beginning of the ballistic missile programs and the hydrogen bomb. The technology revolution was beginning to

accelerate, but we had no idea that it was going to end up this way. There was the national security thing, which really had to do with the military.

Then the third item was, of course, the sociopolitical atmosphere—how would this country deal with this notion of social justice? All three were happening at this time, and we were trying to keep some degree of balance with all of them.

Then I went to Washington. The John Glenn flight was approaching. I remember a guy from Cleveland, Ohio, coming to the Office of Scientific Research (OSR). He looked like some sort of garage-type inventor. He came to the reception desk and he had to talk to somebody to stop the John Glenn flight, because he was convinced that John Glenn was going to kill himself. At that time, the uncertainties in our calculations were just large enough that we really weren't a hundred percent sure. There was an element of risk in all that stuff that we were doing. So since I was the youngest ranking scientist in the office, I was the one who was told to go to the reception room and meet with this guy.

At the time, people were pretty fanatical about their particular theories. There was an editor of one of the physics journals in New York, who kept turning down one guy's article that he was proposing for them to publish. The third time they turned it down he walked into the editor's office and shot him. So we knew, when we were talking to people like that, that there was a degree of sensitivity there. My boss sent me out there. The older guys stayed back in the office. I went out to the reception area and I had to sit and listen to this guy and talk to him. We went into the conference room. And sure enough, like a lot of these scenes, there's a little glimmer of truth in what he's saying. The rest of it may not make sense, but there's a little element of truth in it. The question was how to turn him around and get him to go back to Cleveland and understand that John Glenn's life wasn't at stake. We were not going to pick up the phone and call Cape Kennedy and ask them to stop the flight, which was what he wanted me to do.

While at OSR, I was the project scientist with thirty contracts in the area of basic research. Of the thirty scientists, I would say about twenty of them were in the university community and about ten of them were in industry. We were doing very fundamental research in the areas of aerospace engineering, aeronautic and astronautic. Right after

graduation, I inherited these thirty contracts. Two of them were run by MIT professors who had taught me. I didn't go back and check to see what grade they gave me and see how I was going to treat them in terms of their funding, you know, or whether I was going to recommend that their contract be extended. But that was the level of intensity we were in. I think I remember one of the professors saying, "One of the reasons I'm going to be hard on you guys is because you guys, in about another year or so, are going to be sitting in judgment on my life. So I'm going to make sure that you understand what it is that we're working on."

Those who come after you owe you a lot. It was a small number of you and that says a lot about you. But it also says, from what I've gathered from several of you, something about the institution itself, too. I would like to know more about where you got all that from. This was not typical at this point, so where did you grow up to get that motivation and opportunity?

For a number of us, I think the external environment gave us the support structure that kept us dedicated, even when we wanted to throw our hands up in the air.

In my senior year in high school, I applied to go to the University of Illinois at Urbana to major in physics. My high school counselor said, "No, you want to be a teacher. You don't want to get into science." But what happened was, the Korean War started and they began drafting seventeen-year-olds. Don't ask me why, but in high school—my last year—I joined the Marine Corps reserve unit. Any time you wore a uniform in the black community in 1949 or '50, you had no trouble getting dates. That meant a lot, you know. Then they activated our Marine Corps reserve unit when I was getting ready to go off to the University of Illinois.

My mother didn't tell me how nervous she was about that, but I ended up spending one year in the Marine Corps getting ready for Korea. During that time, I was on the bowling team and there was this black guy who was the chaplain's assistant at Barstow, California, outside of Los Angeles. I'm seventeen years old and he said to me, "You ought to try for the Naval Academy." By chance I happened to mention this to my mother in one of my letters. She took that letter and mentioned it to my uncle, who was a Democratic precinct captain, who then went to Congressman

Dawson. Dawson had an opening and said, "Sure, I'll recommend him. Get me a recommendation from his high school."

So sixty days after writing that letter to my mom, I looked up and I had military orders from the Pentagon that said, "You're to report immediately to the Naval Academy Prep School at Newport, Rhode Island, to take the test for admission to the Naval Academy." I got there just thirty days before the test. They didn't have time to put me into a nine-month preparatory program to get me prepared to take the test. I managed to pass the test in all of the categories and pass the physical, and I got admitted to the Naval Academy.

As I was going from California to Newport, Rhode Island, the train stopped in Chicago. Everybody went by train in 1949. My high school principal met me at the station. She had the entire ROTC there and the Chicago newspaper. They took my picture as I was transferring from the train that came in from California and getting on the train that was heading on into New England. My picture was in one of the leading Chicago daily newspapers the next day. They made a big thing out of it; Dawson made a big thing out of it. I was his first. He had been in Congress for twenty years and I was the first black he had appointed. He had been giving his appointments to the football coach. No way I could go back to Chicago if I failed. I was the first black to be appointed from there to the Naval Academy.

While I was at the Naval Academy, the first year I was in the bottom fourth of the class. But when I graduated, my total cumulative grade point average put me in the top ten percent. In my third year, I got the highest mark on the electrical engineering exam of any of the thousand midshipmen in the class. I had been president of the honor society in my high school, but it was an underserved high school. I lapped up everything they offered, but still, when it was time to go from there to my freshman year at the Naval Academy, I was weak in terms of the tools that they had prepared me with. Yet the question is—what kept me struggling there in that first year, so that by the time I finally caught on to all of the tricks of the trade in science and math, I was able to end up cumulatively at the top?

When I went back to my fortieth reunion at the Naval Academy in 1995, it put this whole thing in perspective. Coming out of World War II, the Navy ended up with ships without technically

trained officers to lead and command the ships. They had to staff up the Naval Academy because many of the officers didn't have the technical backgrounds that they needed in order to operate these floating platforms that were getting more and more sophisticated in terms of electronics and other technologies. That's when the Naval Academy began to play a very important role in terms of the leadership in the Navy.

I only say that because the Naval Academy was an environment where you were respected, you were revered, you were held in high esteem. It kept you going, almost to the point where you were worried about disappointing yourself. But you didn't want to disappoint others. My mother, even when she had trouble getting me to understand right from wrong, would say, "Don't embarrass me, son." It ranged from "Don't have any holes in your socks" to "Please keep good grades in school." That's all she ever said, "Don't embarrass me, son, don't embarrass me." I had this feeling that if I didn't hang in at school, I was going to embarrass her. That probably meant more to me than anything else.

I kept a newspaper article that raised the question of whether kids are dropping out of school or whether the parents are the ones who are dropping out. I still believe that parental pressure has a role to play. And I think that at that time the voices of the adults made it seem like what we were doing as young people coming along was so important that we worried as much about not embarrassing them as anything else. Even if they didn't know what we were going through at the time, they made it seem like a big deal that was important to them—and to us.

My father was only with us until I was seven, so my mother raised us. I had an older sister and a younger sister and I was in the middle, in a span of just three or four years. I didn't have that kind of father role in the house, but I remember every time I went to the barber shop, the barber would always say, "How are you doing in school?" He asked me in such a deep voice, like James Earl Jones. Here I was, twelve or thirteen years old. Just the mere question made me shudder. In the next chair he would be giving some guy a shave with one of those open razors. I never thought of lying to him. I would say, "Fine, fine. I'm doing okay." And he would say, "All right, that's all I want to know." He'd ask me that every time I went in there.

But that was a kind of external motivator. I don't think he was conscious of it. You didn't look at these things explicitly. All these little things adding up created a kind of a thing that said, "You've got to keep focused. There are consequences to not keeping focused, and you don't want to embarrass these people."

That's a long answer to, where did it come from? Even if you were poor, your parents didn't want you to believe that you were poor, and so you had this feeling that things were better than they really were. I think the same thing was true in terms of staying focused as a kid coming along. You've got to have it inside, but you may not have the motivation to bring whatever that internal thing is to bear. So maybe it's a combination of having been blessed with having it inside, but also having that external support system that allows you to keep focused.

You have had tremendously broad experiences that a lot of blacks have never had. You've been places that so many of us have not been. You've seen decisions being made. You've been a part of making key decisions and seeing how things operate in America and in the world. How would you describe the most critical situations that you've had to face and overcome, and what helped you deal with them? All of us at some point get to these points—these critical situations—that we have to face or overcome. They're hurdles or they're bottlenecks or critical points in our careers. When you look back on yours, they were very critical, even if you didn't realize they were at the time. Somehow or another you dealt with them. I think you've talked a little bit about some of them, but I wanted to pinpoint them—particularly given where you are now, which is not just an average location.

Let me reflect on two thoughts, one being a positive opportunity and one being a setback. On the positive side, just the frame of mind of being very attentive to the way things happen around you is important. It could be the way someone makes their rather superb presentation and seems to come out with a successful outcome. What are the tricks of the trade or a particular strategy that someone else uses? It's that informal learning process. If you're fortunate enough to be in the room when important things happen, can you walk out of that room bringing with you the things that will sharpen your own instincts, so that if you find yourself in a situation where you then have to make your own decision, you've learned from it?

I'm reminded of Les Brown and his stories of growing up poor in Miami, being allowed to be the messenger to go out to get lunch and bring it in to the staff at the radio station. When he'd bring in the lunch, he'd always stay for maybe fifteen or twenty minutes, until the staff looked around and got uncomfortable from him being there. But he would stand there and he would watch them operate. Each time he stayed in the control room a little bit longer and a little bit longer and a little bit longer. This one famous announcer, a white guy in Miami, was having a drinking problem. Les Brown used that to strike up a friendship with the owner of the radio station. One day the guy couldn't show up, and the owner somehow unexpectedly out of the blue called Les Brown and said, "Do you know how to do what he does?" And Les Brown said, "I sure do."

I too took advantage of opportunities. You got accustomed to the fact that you'd end up in meetings of a thousand people and you'd be the only black person in the room. It was just one of those things. But, of course, having come through the Naval Academy at that time, you knew what it was about. You kept focused and I guess, when I look back, we made a little bit of a mark that made it a lot easier for others.

In the '60s, I was asked to be one of the founding board members that created the Fermi National Accelerator Lab in Illinois, where I began to represent Northwestern University, the University of Chicago, and the University of Illinois in a lot of activities with the National Academy of Sciences. I also served on their Commission on Human Resources and chaired their Committee on Minorities in Science. And I served as vice chairman of the Corporation for Public Broadcasting.

I remember in 1970 I got a call from the Secretary of the Navy to come and be on the Naval Academy board. That year was a very interesting time for me. I went on the academic board of the Naval Academy, I went on the visiting committee at MIT in the area of aeronautics and astronautics, and I went on the visiting committee at Harvard in physics. Once or twice a year we would come and review the department's program, and then meet with the dean and comment about what we thought about the strengths and weaknesses of the undergraduate and the graduate programs, and the faculty research. I learned a lot.

I was young and I had been involved in a lot, but there were Nobel laureates sitting on both sides of me, so I had to test out expressing my opinion in that kind of environment. But I began to develop an appreciation for how, at the highest levels of technology policy, you began to look at the role of technology.

To be on the visiting committee at Harvard in physics and at MIT in aeronautics and astronautics was quite something. When you are exposed to a lot of wisdom, you can pick it up. Even in your mid-twenties, in your late twenties, in your early thirties, you find yourself in that situation—to just be absorbing all the things that go on. It's not the textbook, it's how people influence each other and what works and what doesn't work. It's almost like lessons learned. Even when you are not a participant, when you're just a fly on the wall to watch it happen, these things can help guide you.

I remember, after MIT, I sat in an office in Washington with a guy named Colonel Boreske. He had gotten two promotions in the Air Force in eighteen months. His desk and my desk were in the same office. I was a young lieutenant and I was his deputy. I asked him one day, "How did you get promoted?" He said, "You know, in every organization, always look out for the one thing that would make a significant difference and that people just seem to be a little reluctant to take on. You can't devote a hundred percent of your time to that because everybody's got to do the blocking and tackling of administration. But always have a little three-by-five card file in your drawer. Every now and then, just pull them out and just work on them. There are some things that could make a significant difference. Just work on it maybe half an hour a day. Then all of a sudden, if it looks like it's something that you can pull together, go for it. That way you will differentiate your own part, your own contribution, so much so that all of a sudden, the next time they have a meeting, they can't have the meeting without you because you have your arms around a certain concept, a certain body of information that they can't go on without you." He also said to always be very careful of only being the "me-too" person of the team, because if they decide to have a reduction in staff and there are ten of you—and all ten of you are skilled in the same thing—how do you make sure that you're not axed when they decide

to cut the force by twenty percent or thirty percent? There's a value you bring to the team that no one else does.

I think of it as a minority, but I think I would say the same thing for a lot of the women who are working their way into the corporate world. You've got to focus on what it is about you that makes you different and better. What is the knowledge base that you bring to whether our strategy wins or loses? That means that the next time they have a meeting, they can't have the meeting without you. Otherwise, they're going without your information.

That was Boreske's advice to me in terms of opportunity. When I find myself in a meeting and I'm sitting there and I'm watching what's going on and I'm taking notes, I'm looking as much at the interpersonal stuff—what makes for how a team works and what the outcomes are and who wins and who loses in terms of the team activities—as much as at the substance or the content. In a real sense, interpersonal stuff can have as much of a bearing on where you end up in life as anything else. The technical aspects are necessary, but you need to add to that the interpersonal wherewithal. You can have two points of view. Each point of view can be equally valid, and one way or the other, one point of view is going to prevail. But what is it that makes that one point of view prevail? And the question is, can I package my point of view in such a way that my point of view more often than not is going to prevail? It's either the good part of human behavior or maybe the frailty of human behavior, but it's the reality.

At Hughes, we teach this to our managers. We have a training program for our top executives in how to communicate with the press. And by and large, a lot of the principles and the little tricks of the trade in dealing with significant reporters in major publications—*Fortune*, *Forbes*, *Business Week*, and so forth—relate to the fact that it's an interpersonal relationship. How do you work it? The basic content of your message is one thing. It's how you shape it and how you can make the difference, and it's persuasion. The reporter can have a point of view and you can have a point of view, and the question is—what point of view ends up in the story? It's a contest. It's just a fact of life and you have to step up to it.

On the negative side, if you start off in life and one good thing happens to you and then

another good thing happens to you and another good thing happens to you, what you have to worry about is—how do you handle your first failure? I learned a long time before I had my first failure that the habits of successful people are very hard to break, even when the environment changes. But the question is, how do you handle your first setback? It can be pretty difficult. I would say in terms of a critical moment, it's encountering that first setback. You've got your heart set on a certain job and you don't end up getting selected for that job, or you think that you should be the one getting promoted and your promotion goes to somebody else. The way I've compensated for that is, I've always had a Plan B. You never take off in an airplane to fly across the Atlantic without an alternate airport in case something happens at the destination that your flight plan takes you to. And you've got to have enough fuel to get there. We can go over the destination airport, we can circle for an hour or two, and we've still got enough fuel to get to the alternate.

I guess I would say that, when you reach the forks in the road and somebody's holding shut the gate that allows you to go take one particular fork that you've really got your heart set on, and that gate doesn't open, you've got to have enough fuel to get to the other one. Otherwise, what's the alternative? Do you self-destruct? Do you just wipe out everything that you've put into it so far? So I guess it's having that contingency plan. You kind of need it emotionally, and when you get the news that your preference didn't take place, you've got to mentally start making the shift real quick. You can't dwell on it and hang and grieve for a long period of time. You've just got to make that shift and keep going.

How did you get started in communications?

I was deeply involved in science and technology. I was at Northwestern. I realized that the public, and particularly school kids, were not aware of what the opportunities were. So what I used to do, when I was in the Office of Scientific Research and at Northwestern in my young days, was go off and talk to school kids about the opportunities in science and engineering. That started me. I would first go out, I would write these speeches, and I would give them.

One of the personal stories I have always remembered about Martin Luther King, Jr., is

interesting. When the struggle started in Montgomery and Rosa Parks was being publicized, the community was all upset and they were interested in starting the bus boycott. They went to one of the old ministers there and said, "We've got to do something." He said, "I'm too old, but there's a young guy who just came here from Boston. He's twenty-seven years old. Let's call him and see if he'll do something."

The first meeting at the church, the people are there and it's getting into the evening. It was after dinner and they were going to have their march. But before their march, they were waiting there for the minister to come out, take the pulpit, and say what it's all about before they were going to walk outside. They knew that the Ku Klux Klan people were across the street in their hoods.

There were about six or seven ministers sitting around this table in the back of the church—sort of like the minister's study—and at the end of it was this young black, Martin Luther King, Jr. The ministers saw that he had his pad of paper. He was doodling. They had asked him to speak and he had agreed to do it. He was there doodling and it didn't look like he was focused at all. One of the old-timers turned to him and said, "Reverend King, are you having trouble getting started with what you're going to say?" He said, "No, I'm trying to figure out how I want to end it."

I use that point when I work on speeches, even for the chairman here at Hughes Aircraft or Hughes Electronics. The first thing we have to decide is, where do we want to end up? There are nine different ways you can start this speech, but how do you want to end up? That's going to be the most important thing, and that was King's approach. Of course, the nation is better off because of it, because he had this way of saying, "How do I want to end up and what is the main point I want to make?" That was his approach. Of course, they just left him alone and he went ahead and kept doodling. Then he went out, stood before the congregation, and made one of his early stirring speeches. That was when he was first introduced in Montgomery.

Then, of course, I began to realize that many of our technical institutions and many of our technical industries are ill equipped to get the public aware of the value that they bring to whatever the quality of life is. I began to feel as though that was going to be their Achilles' heel. To some extent,

universities were like that. Now, I think, universities are better equipped and are more actively going out and making sure that their surrounding publics are more aware of the importance of what they bring.

The King approach has stood me in good stead even to this day. When the new chairman came to Hughes in 1993, I was the first person he wanted to meet, because he was getting ready to hold a news conference. We flew him in a corporate airplane under an assumed name. We went over the announcement that was going to take place two hours later. We had the satellites all set because we were going to broadcast the announcement by satellite into all of our plant facilities. I had worked out the arrangement to introduce him, to walk him into the auditorium, and the retiring chairman was then going to introduce him as the chairman coming in.

After he got on board and took charge, he began to work and make us more competitive. He came up with this new organization chart. What happened was that he came in and handed the personnel department people his version of the chart. He had drawn it out in pencil. They noticed where he placed Communications. When they saw where he had put Communications, they decided that he had probably made a mistake. They thought, "He ran out of paper and he couldn't put it over to the side, so let's give it back to him in two forms."

They actually put two sheets of paper in front of him. I'm hearing this from the guy who actually had to meet with him. He said, "We took your pencil sketch, Mr. Chairman. Here it is, but we noticed you had put Communications first and we thought maybe you'd want it over here on the side after Legal, Finance, Marketing, and Technology. We also did it and we put Communications over here on the side after finance and marketing and what have you." And the chairman said, "No, this is exactly the way I want it. When it comes to leadership, I want to send out a message as to the important role that Communications is going to have." The result was that he became regarded as an excellent communicator who was able to use Communications to really influence the direction and motivation of this company. There is a role for communications. It's a very, very influential field. It can be an asset. If you don't do it right, it can be a liability.

Thinking back, the one thing that they said to me when I came here was, “What we like about your background is that we can bring you into a technology-intensive company and, even though you’re on the communications/PR side, we look at your background and say that you understand us because you are an engineer.” So I can sit in meetings with Ph.D’s from Stanford, Caltech, Berkeley, UCLA, USC, Harvard, Yale, Princeton, and MIT. And I say, “I hear what you’re saying, but I would like to recommend that instead of zig, we zag.” It’s that credibility. I probably haven’t touched a technical instrument in fifteen years, but it’s a prior association that gives you credibility. They at least listen to you. They give you the benefit of the doubt.

Anyhow, that leading place on the organizational chart didn’t exist when I came here. I think the fact that he put communication in the forefront on the organizational chart has caused a lot of people to think. It has certainly made the people behind me here walk a little taller. Now we have to live up to what’s expected. It’s a nice place to be.

I have two more questions. One is really more related to something you talked about earlier, but I think it’s important in terms of trying to put this piece together for our young people. It’s in two parts. Based on your own experience, is there any advice you might offer to young blacks who are entering the kind of profession that you’re in? We’re talking about high school kids, we’re talking about freshmen whom I counsel a lot and whom other people counsel, particularly before getting to college. There’s a message that I think we need to try to keep giving back. In talking to someone as important as you in this organization about the trailblazing things that you’ve done, what advice would you give to young blacks who may perhaps look in your direction and go down that path?

There’s a fashionable term, “Pursue your dream.” But I think that’s a little bit too idealistic. There are certain needs in society that have to be met, and that creates a demand. As we come from childhood right up to being young adults, there’s kind of a balance sheet of assets and liabilities, personal strengths and weaknesses. If we are aware of what our strengths are and the kinds of things in life that we seem to comprehend a little better than others, those are probably little messages that are being sent to us, to the effect that we may have been

blessed with a certain set of attributes that steer us in one direction as opposed to another.

I think what we then have to do is to decide, how do those fit in the overall canvas and in the overall fabric of where the needs are? If you find a fit, go for it. If you develop a certain set of skills in a certain direction, as you get through the early period of life, you can then transition into much broader things. I don’t know whether it’s in health care or it’s in science and technology or if it’s on the creative side, whatever, but the brain is not all balanced. Sometimes the left side of the brain is a little more adept than the right side. I would say that if you find something and you’re comfortable with that, that is where the fit is in terms of the things that seem to interest you most. There’s a reality check, and if the reality check says that there’s a need there, then go for it. I would caution, though—don’t be overly swayed by what the external forces are saying that you should do, unless that kind of meshes with what it is that you have.

When I used to go out to Northwestern and talk about opportunities in science, sometimes they’d send me into some of the wealthy high schools in the northern suburbs of Chicago as well as to the inner city. This is where Northwestern draws a lot of their college students. They’re going to have “career day,” and they want somebody from Northwestern to come out and talk about science and somebody else to come and talk about careers in the arts and so forth. They’re going to have their seniors attend. Sometimes there were hardly any minorities in the audience. What was very interesting is that quite often there would be young girls who would come up to me afterwards and say, “I like what you said about science and engineering. I want to go into it, but my father wants me to be a nurse.” I would say to them, “You have to respect your parents and so forth, but that’s not the track you want to go.”

So you have to listen to your inner voices, and if your inner voices are telling you that there are certain aspects of knowledge that seem to fit better with you, then those are the subject matters that you tend to gravitate toward. I guess academia still hasn’t told us whether interest and understanding are synonymous. Do you understand something better because you’re interested in it, or are you interested in it because you understand it? I don’t know. We won’t worry about that. A hundred years from now they’ll still be debating that

issue. But if interest and understanding seem to have the right chemistry, and there's a reality check on the outside, go for it. If the reality check says that there are only so many places for archaeology, we've got to be worried—particularly for minorities—because our reentry doors and opportunities are not as extensive as they are for the majority. That's the sad part about young kids who come out and spend an inordinate amount of time going down roads where there's no payoff. The reality check isn't there, or they're pursuing something more for fun and games.

I think we're still in a very serious civil rights struggle. I'd like for you and me to feel as though, somewhere along the line, the struggle has been won. But I doubt it. While there are still glimmers of hope, probably our kids are going to have to inherit the struggle. And, as a result, we probably don't have the luxury to go off and do so many of the esoteric things that the more financially secure parts of the society are able to do.

The war is still on, and I guess not everybody is born equal. If you happen to find out that either because of the genes of your mom and dad, or because of the nurturing you got as a kid growing up, you end up a little better off than everybody else, the term that I use to remind corporate America—it's a French term, and I think it's just as applicable to the young kids—is “noblesse oblige.” There is an obligation that comes with being blessed. Somehow you luck out and you've been given certain strengths that give you the potential to have a position of privilege in whatever setting of society that you're in. You don't have to walk with a Bible under your arm to realize that somehow that the overall community and nation are going to be better off if those who have those gifts also feel a sense of obligation to those who do not. There are young people coming along who have the capabilities. If we are indeed still in a struggle—and I think we are—all of the evidence points to the fact that we can't declare victory yet, for this society is still the role model for the rest of the world.

Let me say one final thing. When young people pursue their dream, they should keep in mind that many Americans—rich and poor, powerful and powerless—are still continuing to change things to the way they should be. Therefore, more and more opportunities they will encounter are

not very apparent today. Focus on the future, and not on the past.

A striking example is the role of women—including minority women—as graduates of the Naval Academy, and how the academic board got involved to make the admission of women a smooth transition that is now looked upon with pride. When we would go down there for an academic board meeting, one of the first things the board would do is have an evening dinner privately, with just the academic board meeting with the superintendent. That's when the superintendent would go over the sensitive issues, things that were bothering him from an academic point of view. Then the next day we'd have to have a public meeting with the faculty and whoever else wanted to come.

One of the issues that the superintendent raised every time we met with him in his private quarters was the role of women, and the admission of women into the Naval Academy. I went on the board in 1970 and I was on for ten years. Around 1972 or '73, the superintendent started saying, “You know, Congress is beginning to raise questions and these are questions that we can't ignore. We don't think we're at a point where we have to change, but at least we're going to be prepared.”

So for about two years, each superintendent—West Point, the Naval Academy at Annapolis, and the Air Force Academy at Colorado Springs—had contracts already signed, with building contractors in the local area as to what it would cost to convert the dormitories and allow the admission of women. And so they got together every quarter, the three superintendents, and they would exchange ideas—“Okay, what are you worried about, what's happening?” It was kind of a little summit meeting of the three superintendents. One of the things they would do is report to us on the academic board as to where they stood relevant to the admission of women.

Well, it turned out that if you look at the record for 1976, all three academies admitted fifty women. Now you ask yourself, how did that happen? Was this just out of the blue? Maybe they just woke up one day and there were fifty women? No. They all agreed to change together. And if we go, we're not going to admit one or two, we're going to all admit a sufficient number so that when women come here, they have a group of colleagues or peers that they can associate with.”

That was the decision in 1976. Twenty years later, the Naval Academy has graduated two thousand female graduates. Last year, of the top ten graduates grade point-wise from the Naval Academy, four of them were women. One is a brigade commander. Today, the Navy has female officers in every specialty except submarines and the Navy Seals. And as of today, women are flying F-14 jet aircraft, F-18 jet aircraft. They're combat pilots and fighter pilots. That's why it was so embarrassing for me to look back and to just listen to all the machinations of the Citadel and places like that who are trying to struggle against this. I'm just wondering, "Wait a minute. If they're supposed to be any kind of military training institution, and the three premier institutions have changed in such a way that they demonstrated that it could be done, why is it that the others can't?"

Of course, the change that led to the involvement of black men at the Naval Academy—of which I was a part—occurred much before that. It would really strike me when I would go back fifteen years after graduation as part of the academic board. From 1970 to 1980, I would be invited to sit with the superintendent up on the stage as they were giving out the diplomas. I would see this mass of young people graduating. They were all in uniform getting ready to throw their hats up in the air. And I began to see the numbers change during that time. While I was the only black in my graduating class, after I graduated the Naval Academy had two blacks in each class and then they went to about four or five in each class. You could almost just see the numbers begin to grow. But I began to see the numbers of blacks graduating from the Naval Academy go from when it was like one every other year, which was my period, to a hundred or so. The challenge now is, how do we keep the momentum going?

JEROME I. FRIEDMAN

b. 1930, AB 1950, MS 1953, PhD 1956 (physics) University of Chicago; joined the MIT faculty in 1960; professor of physics, 1967- ; William A. Coolidge professor of physics, 1988-1991; Institute professor, 1991- ; head, physics department, 1983-1988; appointed director, Laboratory for Nuclear Science, 1980; fellow, American Physical Society and National Academy of Sciences, 1992; president, American Physical Society, 1999; co-recipient, along with Richard E. Taylor and Henry W. Kendall, of the Nobel Prize for physics in 1990, in recognition of research on particles known as quarks; member, Nuclear Physics Review Committee, Hampton University, 1995.

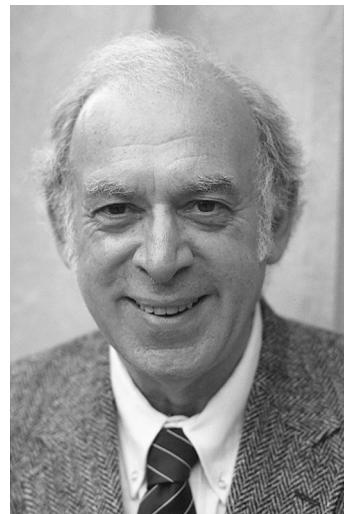

I was raised on the west side of Chicago, which was a very poor neighborhood. My parents were immigrants who came from Russia and settled in Chicago. I grew up during the Depression and we were always short of funds in the household. Things were a struggle, but my parents always managed to keep food on the table and they always managed to try to do a little something extra for the children. For example, even when they could hardly afford it, my mother decided I should have violin lessons. I took violin lessons for about a year and a half and then I realized I was more interested in painting, so then she gave me painting lessons. This was done with great difficulty because there was, as I said, very little money in the family. In fact, I can remember once during the time I was growing up that the landlord came and wanted to evict us from our apartment because we were unable to pay the rent. But because there were many families in that situation in those days, the landlord decided to let us stay there because the next family that would move in probably would not have been able to pay the rent either. Nevertheless, my father was able to make a go of it and we ultimately were able to pay the rent and stay in this apartment.

I went to Ryerson Grammar School, which was an inadequate grammar school as I remember it. The teachers were better known for harsh discipline than for teaching. The neighborhood predominantly consisted of poor immigrants. I felt out of place, to some extent, because I was one of the few Jewish youngsters in the neighborhood. I was only grudgingly accepted among my friends,

just barely tolerated. However, I did manage to get along and develop in this neighborhood.

The high school that I attended was located in a different type of neighborhood that was somewhat distant from where I grew up. It was a much more balanced school, having a mixture of Jewish kids, non-Jewish kids, and blacks. It was a truly integrated high school. I found attending this high school to be a wonderful experience because I saw a better cross-section of the society in which I lived.

It was the first time I really got to know African-Americans personally. When I was growing up I never met any, and my knowledge about them came primarily from comments made by my parents, my classmates in grammar school, and the kids with whom I played. My parents didn't speak too much about racial issues, except for

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with Jerome I. Friedman in Cambridge, Massachusetts, 28 April 1998.

expressing the idea that one should understand and accept everybody. They pointed out that the world was made up of diverse groups and every group had something to offer. I never heard any prejudicial statements from them, but the environment in which I grew up was an environment in which there was a lot of prejudice. Fundamentally, the youngsters who lived in my neighborhood didn't like blacks or Jews, and, as I said, I was just tolerated. Chicago at that time was made up of little ethnic enclaves and these ethnic groups didn't get along with one another either. Very often there would be quarrels and fights between youngsters living in nearby neighborhoods. So I was brought up in a neighborhood in which there was a good deal of enmity and belligerence.

But going to high school was really quite an eye-opening experience because I finally met many different types of youngsters. I got to know, as I said, African-Americans as classmates. Of course, the thing that was remarkable was that all of the stereotypes to which I was exposed just fell away. There's just no way to support stereotypes once you meet people.

They don't relate, do they?

They don't relate to anything. I remember taking a course in geometry in which there was a student in the class by the name of Bill Pitts, who was an African-American. He was one of the best students in the class, a really very sharp young fellow. I got to know him and enjoyed talking to him about the course work and other matters. I also remember a black student by the name of Delores Thomas, who also was an outstanding student. When the time came for giving awards out in this high school at graduation, the class decided to assert a certain sense of irony by voting to give her the Daughters of the American Revolution Award. The class was saying that the DAR would just have to accept this. And, of course, at that time the Daughters of the American Revolution was quite a racist organization; I remember when they deprived Marian Anderson of a concert hall to sing in. I think it was in Washington, DC. The high school I went to was a wonderful high school from that point of view. It was the beginning of what I call my broad education.

What years were they?

I entered Marshall High School in 1943 and graduated in '47. It is the high school at which *Hoop*

Dreams was filmed. In fact, I saw the old gymnasium in the movie. I heard the "Commando Song" being sung, and it brought back many memories. In my day, Marshall High School was really a powerhouse in basketball and it was really interesting to see that this tradition has been maintained over time.

In high school, I was interested in art and painting. This particular high school had a special arts program within the standard high school curriculum. I took enough other courses to fulfill college entrance requirements, but a good deal of my time was spent in my art classes. I would spend about three hours a day painting and drawing. It was a special place and I really enjoyed the art. But, of course, as you well know, it was something I didn't pursue as a career.

You might wonder how that came about. That came about because of something that happened in my junior year, or maybe at the beginning of my senior year, when I visited the Museum of Science and Industry in Chicago. It is a wonderful science and technology museum on the South Side of Chicago, which I used to enjoy visiting. I remember picking up a small book on relativity there that was written for people who didn't have a strong scientific background. The idea behind this book, which was written by Einstein, was that with a few algebraic equations and lots of text one could understand special relativity. I was fascinated by that possibility. Of course, Einstein was a real icon in those days. To me, my family, and to most of society, he was almost a cult figure.

Still is.

He still is. I was fascinated by the subject. I had heard about some of the strange phenomena of special relativity, such as if you have a moving clock it appears to slow down, and if you have a moving meter stick it appears to shrink. I really wanted to understand this. So I purchased this book at the museum and I read it very methodically, going through every equation. Although I did this meticulously, at the end of the book I concluded that it was really very interesting, but I still didn't understand it. So I decided that I needed more education.

This was just about when I was ready to graduate from high school. I was awarded a scholarship to the museum school of the Art Institute of

Chicago, so I was very tempted to go there. But I also received a scholarship from the University of Chicago as a result of doing quite well in my academic subjects. So I had a difficult decision to make. My art teacher wanted me to continue in art and was very disappointed when I finally decided to go to the University of Chicago. That's where my career started developing. I spent the first year and a half at the University of Chicago studying liberal arts—it was during the Hutchins period.

The Hutchins College was a very unusual place. High school students could enter the College from the end of the sophomore year on, and the amount of time spent in that college depended upon how well the entering student did in the placement examinations. You could get an AB degree immediately or after four years in the College, depending upon your placement examination results. But the whole point there was that there was a body of general knowledge that one was expected to know before starting studies for one's career.

The College curriculum covered humanities, social and political science, history, philosophy, and the physical and biological sciences. It was a wonderful education which opened the world to me. One very unusual aspect of it was that students used no textbooks. They only read from the original materials, and these readings were analyzed and interpreted in class discussions. There weren't examinations during the academic year except for diagnostic exams at the end of each quarter. These had no effect on your final academic record. At the end of the year, there was a six-hour comprehensive exam in each course that determined your grade for the year's work in that particular course. This system gave the student great freedom, but also required great self-discipline. You could go to class or not go to class. The only requirement was that you had to pass the comprehensive to get credit for a particular course.

As I said, I spent about a year and a half in the College. In the second year, I started taking a few mathematics courses because I didn't have enough mathematics in high school as a result of the time I had devoted to my art studies. I decided that I wanted to study physics at the University of Chicago. There were a couple of reasons. I had become deeply interested in physics from an intellectual point of view, and Enrico Fermi was teaching physics there. This was a wonderful

opportunity to learn physics from one of the greatest physicists of the twentieth century, as well as from the outstanding faculty he had assembled in the physics department. I found the beginning courses in physics very difficult because I did not have the appropriate background. It was quite a struggle. There were a few times when I felt that maybe I had chosen the wrong field, but nevertheless I persisted.

The reason that I was able to enter the physics department with my inadequate preparation was a consequence of how the educational program was run. It was based on the idea, which I suspect was due to Fermi, that anybody with an undergraduate degree should be allowed to enter irrespective of credentials, and that difficult courses and examinations would provide the selection process. So, for example, in my first year of physics there were about 125 students who started out at the beginning of the year and about 30 finished at the end of the year. After a second year of courses there was the first major examination, the so-called qualifying examination, which roughly fifty percent of the students failed. A year later there was another examination, the Ph.D. qualifying examination, and roughly fifty percent failed that one also.

So it was a very arduous and difficult education, but one which I enjoyed because I really enjoyed the material. Once I finished my Ph.D. qualifying examination, doing research in physics was just an absolute joy. I also had the very great fortune of being able to do my Ph.D. research under the supervision of Fermi, which I never would have expected. Working with Fermi was a dream of mine. With little expectation of success and with some trepidation, I decided to ask him if I could do my thesis research with him. To my great surprise, he said yes.

He was human, right?

Yes, very much so. I was very pleased. As a matter of fact, I was elated. He gave me a research problem to do and I started working on it. Unfortunately, he died two years into my thesis. It was a very tragic death. He developed a rapidly growing cancer that was inoperable, and he died in 1954. His loss was devastating and it was a very sad time. Since I had invested two years in my thesis, I wanted to continue, but I had no supervisor.

Professor John Marshall, who was very kind, came to my rescue. He said to me, "Jerry, finish your thesis. Just do a good job and I'll sign it."

Without his help, I would have been stranded. Professor Marshall came to my assistance when I needed his help and I will always be grateful to him for that.

For the record and for those who are laymen, tell us a little bit about who Fermi was.

As I said, Fermi was one of the greatest physicists of the twentieth century. He was raised and educated in Italy and was unquestionably a genius. Very early in the history of quantum mechanics he developed its first application to field theory, namely, its extension to describe the radioactive decay of nuclei in terms of the weak interactions. He did research in neutron interactions for which he received the Nobel Prize, and discovered the first excited state of the proton. The first chain reaction was achieved under his leadership at the University of Chicago as part of the Manhattan Project. He was an absolute master in that he could do both theory and experiment. His physics courses were legendary for their clarity and the physical insight they provided. He could make things in the machine shop, which he sometimes did rather than asking a technician or student to do it for him.

He was really an all-around physicist and also a very nice man. He was very helpful to his research students, providing wonderful guidance in helping them understand difficult points. In general, he was greatly concerned about pedagogy and really wanted students to understand. His research students were sometimes invited to his home for social gatherings and were treated with gracious hospitality by him and his wife, Laura. He was a wonderful man and it was a great tragedy when he died so young. He had so many different achievements to his credit.

What do you feel you took away? I mean, having the privilege of working under such a giant in the field, what do you think you were able to take away from having that exposure at that time?

Well, Fermi was a man who understood things physically and also had great strengths in mathematics. In fact, some of his first published papers, done when he was seventeen years old, were in mathematics. But he always understood things from a physical point of view and could explain things with very few equations because he understood physics so deeply. The attempt to understand things in that way is something that I've tried to

aspire to—clearly not being able to reach the levels of Fermi, but trying very hard to think about physics in that way. He also taught me something which was very effective and helpful in my career, namely, if you want to do an experiment, calculate everything beforehand in terms of what you could expect, given the types of processes that could occur, in order to understand the sensitivity of the experiment. Do this very carefully before you engage in the experiment.

He taught me many lessons. But I think the idea of trying to understand physics from a physical point of view, in terms of what is really occurring, rather than just thinking about the equations, had the greatest impact on me.

There were several of you who worked under him. Have some of those who worked under him during the time you were doing your thesis and doing your studies gone on to be extremely outstanding, like yourself?

Oh, yes. He had a number of students who developed into outstanding physicists. Among the people who worked with him were T. D. Lee, C. N. Yang, and Jack Steinberger, all of whom were awarded Nobel Prizes. A number of his students got Nobel Prizes.

Are you saying that he probably was the key factor in their being able to get on the right road to obtain a Nobel Prize?

Well, I think he certainly played an important role in directing people in the right direction. I don't want to take anything away from the people who have gotten prizes because they no doubt have great intrinsic abilities. There's no question about that, but I think his influence was probably very important in their success.

If I had to identify other really memorable role models of yours, who would they be, other than someone like Fermi?

Well, I think he probably was the most important role model for me in my intellectual development. There were many people who were really very wonderful teachers over the years and to select one or two of them would probably not be fair to the others. There were many people who were very influential, but if I had to say who really stands out as a role model, I think it would be Fermi.

I know we are overlooking a number of steps and you may want to bring some of them in, but how did you actually come to MIT?

When I finished my Ph.D. research, I spent an additional year at the University of Chicago working in the laboratory of Professor Valentine Telegdi, who was also an important influence in my development. He was a young faculty member who had just taken over Fermi's lab. His depth in physics was outstanding, and I learned a great deal from him by talking to him and working with him. That year he and I did an experiment together that had some importance. It was one of the three first experiments that independently confirmed the non-conservation of parity in the weak interactions. This was a very, let's say, lucky thing to start out with when one does one's first experiment after a Ph.D.

Now, I must say that Professor Telegdi deserves the credit for doing that experiment because it was his idea to test some recent ideas of Lee and Yang. He asked me if I would participate, and I was intrigued with the idea. My contribution to the effort was doing the major part of the experimental work. Most people thought that that experiment was a waste of time, and, in retrospect, I am glad that I had enough sense to take the opposite view. It turned out to be an important result because it overturned a long-held assumption and pointed the way toward understanding the structure of the weak interactions. That effect, the non-conservation of parity in the weak interactions, is an effect in certain reactions in which you see that a mirror image of a reaction differs in a fundamental way from the original reaction. That was a very perplexing point of view, but it turned out to be correct. I remember giving a seminar at Chicago before we did the experiment, telling what I was doing with Professor Telegdi. One very revered older physicist who was there came up to me after the seminar and with a smile on his face said, "You know, that's an interesting measurement, Jerry. But you know you won't find anything."

So that was the context in which the experiment was done, and, of course, when we found this effect, we felt very fortunate. When the year was over, Val Telegdi got me a job at Stanford, where I changed my experimental technique. In the past I had been using nuclear emulsion as a detection technique. Nuclear emulsion consists of thick photographic plates. These are exposed to particles which interact or decay in the plates, leaving tracks which can be seen under a microscope. It's a visual technique in which you can

actually see what has occurred and make detailed measurements. For example, you can measure angular distributions from which physics information can be extracted. I decided that by the time I was finished with the experiment with Val Telegdi, this technique was almost over, because it was being superseded by the bubble chamber. I decided to go into a different technique, so I accepted a research position at Stanford to work with Bob Hofstadter to learn counter techniques and do experiments in electron scattering. In these experiments electrons are scattered from various targets, such as protons and nuclei, and the accelerator and detector are used very much like a large, powerful electron microscope. You can actually determine the internal structure of target particles with such a technique.

I worked with Bob Hofstadter for three years and then I decided it was time to try to get a faculty position that would also permit me to do research. I had heard that there was an accelerator being built at MIT, the Cambridge electron accelerator which MIT was building in partnership with Harvard. So I decided that would be a good place to continue experiments in electron scattering. I met Martin Deutsch at Stanford, where he had come to visit. I asked him about the possibility of getting a job at MIT and he told me there was a very good possibility. I applied and got a job at MIT as an assistant professor. I didn't necessarily think I would be here very long because my major intent was to work on that accelerator and I didn't know how long the program would last, nor did I know whether I would get tenure. I was the kind of person who would travel to the next accelerator just to do physics.

I came to MIT in 1960, so it's been quite a stay. The accelerator came and went, but I'm still here.

What were your early impressions of the environment, particularly with regard to race relations and the racial composition of the campus, when you first came in 1960, or just in the early '60s?

Well, when I first came to MIT, MIT was predominantly a white, male institution both in faculty and in the student body. In those days, I think one found very few African-Americans among the student body, and very few women. I don't recall having that many Asian students here at that time either. So there was really quite a different popu-

lation. I remember in the early years teaching Shirley Jackson in a recitation section. She became the first black woman to be awarded a Ph.D. at MIT and went on to a successful career in industry, academia, and government. She is currently serving as chair of the Nuclear Regulatory Commission.

How do you account for the fact that even in those early years, and certainly up until the mid-'70s based on my research, the few black students who were here, most of them—or a large portion of them—were in physics, in your department?

Well, that's interesting. I think the physics department has for many years played a special role in trying to increase diversity. Of course, things were happening in those days which I wasn't totally aware of because I wasn't close to the administration of the department. But later I learned, for example, when Herman Feshbach was head of the department, that he sent faculty members down to historically black colleges and universities to try to interest students in applying to MIT. We got a number of such students in the department. I think the department always has made special efforts to try to encourage more diversity. Why this department and not others I cannot say, but I think that's just a historic fact.

Well, it's a fact. Since '72, I've worked with a number of faculty members and I don't know—you can help me out on this—with most of the faculty members I have gotten to know very well and have worked with, there have been two factors for the most part. They either come out of the physics department or, if they don't, they have been in many cases Jewish. What are some of the possibilities of why that would be the case, do you think?

Though I don't know if I really understand the reasons, I would like to make some comments about this. It is difficult to really know what motivates others, but perhaps my own feelings could serve as a guide. The Jews have suffered enormous persecution throughout history. Coming from a group with this terrible history and having experienced prejudice and discrimination myself, I am deeply troubled when I see other groups being mistreated. Jewish faculty members, especially the older ones like myself, come from immigrant families who saw education as the surest way to improve one's position in society. In the same way that we achieved upward social mobility through education, we see that as a path for minorities, and

increasing diversity in universities is a way of enabling them to follow that path.

Education has always been important in the Jewish tradition. My parents took the point of view that the most important thing to do was to get a good education. They weren't concerned about how much money we made as adults. They said, "Look, live a comfortable life, but get a good education—that's the most important thing—and then do something in life that's constructive." I found that to be excellent advice.

Now, why the physics department worked to increase diversity more so than perhaps other departments is an interesting question, and I don't really know the reason for it. It could be that it was a historical accident, in that there were a few people who were in positions of power in the physics department who had a very broad view of what should be done, and they had great influence. I have a hard time understanding why physics, in particular, was different in this respect.

Well, I really don't quite understand it, either. I do think that perhaps your first point had something to do with it. You mentioned, of course, Herman Feshbach, but you also had people like Al Hill.

Oh, that's right. I really should have mentioned Al, because he did it even before Herman. I'm sorry for this omission because Al Hill was very passionate about trying to increase diversity in the department. He provided early leadership in this area. Al was a very special person who had a broad view and was not parochial in any respect. He wanted to include everybody in the tent, and he was a man of compassion who wanted to make things better for people.

It's a very important aspect of the history of the black presence on this campus. I mean, I think that that department—when you look at it in terms of the history, which I have done—just comes right out at you. I think it's really worth making a note of that. Could you outline what you have liked most and least about MIT's efforts to increase the black presence on campus?

I think that's a hard question to answer. Let me think about that. I like the fact that MIT has stood firmly behind affirmative action because I think affirmative action is very important. It has been a very important component in increasing the number of blacks in universities. I think it is important to point out that affirmative action is not used to bring unqualified people into a system. What it

really does is extend the measurement tools that are used to assess merit. The intrinsic abilities of a person have to be taken into consideration in various ways, in addition to how well one does on specific tests. Test results very often have a sociological context, having very much to do with the quality of one's previous education, and they do not necessarily reflect the individual's potential. The point is that affirmative action allows people to have the opportunity to get into programs in which they really should be in terms of their intrinsic abilities, even though their backgrounds are sometimes inadequate. That is really what affirmative action is to me, and I think MIT has successfully pursued that approach. I think that it has been an extremely effective tool in increasing the numbers.

The thing which I find most disappointing is that we don't have more black faculty. But I think that's a pipeline problem, to some extent. I think as we get more youngsters into the educational programs and bring them up through the universities, we will have a bigger pool. I think that's going to change the situation considerably. Nonetheless, I think we have to make an enormous effort to seek out black faculty members. But the trouble is that all the universities are vying for the same people and it gets very difficult because there really aren't enough to go around.

It's about close to forty years, would it be, that you've been here?

Yes.

Have you had any relationships with, say, black faculty members as you have with other faculty members? Is there anything that stands out in the way of your relationship or in talking or learning about any issues?

There was one black faculty member in the physics department some years ago, Jim Young, whom I got to know socially as well as professionally. But aside from him, I didn't have much contact with black faculty members until relatively recently when I joined the Martin Luther King celebration committee. It has been a great pleasure to have the opportunity to work with black faculty and establish some new friendships. I regard them as I do any other faculty members at MIT. They're obviously of the same caliber and have the same professional qualifications as any of us here.

What about black students?

I've had black students in courses over the years. About ten years ago a black student did a senior thesis with me. Unfortunately, I have not had a black graduate student to work with. However, I've interacted with black students in a number of different ways. When I was head of the department, I worked with a number of black students when they were establishing the Black Physics Students Association at MIT. The purpose of this organization was to hold a yearly conference to inform minority undergraduates about the opportunities of a career in physics and how to get into graduate school. I got to know some of the students who created this organization, in particular Cynthia McIntyre and Fuad Muhammad, both of whom were graduate students at the time. Claude Poux also worked on this effort, and although he wasn't a student at the time, I also got to know him. These were wonderful young people who had outstanding dedication to a goal that took over two years to complete. They really wanted to make a difference and they did. I found it remarkable that they did this while carrying out their normal academic and research responsibilities, and they both successfully completed their Ph.D. research and were awarded their degrees.

I must say that the black students who are coming into MIT now have a good deal more confidence than they did in my very beginning years. When I first came to MIT, they were a small, isolated group who probably felt that they were in an unwelcoming environment. I think very often when they came, the expectations about them were not high and that was communicated to them in various ways, which was unfortunate. I think it's quite different now. I think the expectations are high, the students are more confident, and they do very well. Have you noticed that also?

I would have to agree with you. I think that's absolutely right. The one thing that I think is remarkable about you is that I haven't met anyone as modest as you, relative to your achievements, and perhaps that's what really makes you so extraordinarily outstanding. In all of this discussion, you have not mentioned your Nobel Prize, you haven't mentioned all the other achievements. How does it feel to have been to the mountaintop?

Well, I'll tell you, receiving the Nobel Prize was an absolutely wonderful experience. Sometimes I can't even believe it occurred. I have to go back to the photograph albums to assure myself that it

actually happened. As I think back about the whole experience, I find it unbelievable.

Let me put it this way. I did my work because I am curious about how the world works and I get great pleasure from finding out. Obviously, I was elated to get recognized for my work, but that's not why I did it. To be able to do the work and be fortunate enough to have been involved in an effort that taught us something new about nature was, to me, more than I could have asked for. Being recognized as I was—that was frosting on the cake. I feel I was very privileged in that I received a good education, was taught by outstanding people, and was given the resources to do the work.

For the layman out there, explain what that is, that Nobel Prize for physics. Explain that so they understand what that really means, what kind of stature that falls into, and how that process goes about in terms of selecting someone each year that they do this.

Well, nominations of candidates are sent to the Nobel Committee each year. This committee then does a great deal of research in order to ascertain the importance of the work, who did what, and what effect that work has had in the field. The research is very extensive. It is perhaps the most researched award that one would find anywhere, and this is one of the reasons that this award has such credibility.

What does it really mean in one's life? It means that essentially one is put on a pedestal, which sometimes can be a little uncomfortable. It's very easy to fall off a pedestal. And it also means that one is asked to be on many different committees and represent many different causes. I get requests every week to sign some petition or do this or do that because the position does attract a lot of public attention. I think it gives one some influence, but I think one has to use it very thoughtfully.

Some of the students or former students here whom I've interviewed in this study have mentioned you as a person who has been extremely supportive of them and they still remember that kind of help. Cynthia, for example, also mentioned the fact that you were a major person who helped her to move ahead to put together this organization of black undergraduates, I guess, and maybe graduate students too. But it's mostly undergraduates.

It's mostly undergraduates.

Now there's a national organization.

Yes. Cynthia came to me when I was head of the department and told me about the wonderful idea she and other students had come up with, and I realized it was a marvelous idea. What I did was to get funds from outside of the physics department and from the department to sponsor it for the first two years. Cynthia and Fuad and the others had an idea that was so important and relevant that there was no way that one would not support it, no way.

The whole idea was to tell undergraduates about the great opportunities in graduate school and in a subsequent career in physics. The first time we held the conference I came to the realization that most undergraduates did not know that if they went into physics in graduate school they would be supported by teaching or research assistantships. They thought it would be another four to six years of tuition and heavy burdens to their parents. Because of this, many undergraduates thought going to graduate school was impossible. Just to have that knowledge made such a difference to these young students because just getting through their undergraduate education was such an economic burden for most of them.

That's right. Well, they have not forgotten it, I can only say that.

I'm glad that Cynthia came to me with that idea. That was one of the best things that happened when I was head of the department, because that really has had a long-lasting effect. There's a black physics society for professionals, and now I meet many physicists in that society who had gone to these conferences in the past. It really has increased the number of African-Americans in physics, and will continue to do so. This increase gives me a lot of satisfaction.

Well, it should, because it was a major supportive role. You can see the difference and it's amazing.

You're probably not a person who would give advice, but if you had to give advice to young, black faculty members coming to a place like MIT, what would be your best thoughts on that?

Well, if asked, I would give the following advice to incoming black faculty members. First of all, have the point of view that you can make it, that there's no reason why you should not be successful. Number two, reach out for all the resources that are available because there are resources around

here that sometimes are not utilized by people. In addition to reaching out for resources, build all the bridges you can build. I would give the same advice to incoming white faculty. The color of one's skin and one's ethnicity or religious background are not relevant to these issues, nor to other matters.

I feel very strongly about this because I was sensitized to discrimination at a very early age. When I was younger I was exposed to a good deal of prejudice directed at me—not at the level that a black person experiences in this society, but painful nonetheless. It was different in the sense that there were people who sometimes didn't know I was Jewish. But when some people knew I was Jewish, there was definitely prejudice.

Being the object of prejudice is something I've learned about the hard way. There were times when I was a youngster that I was attacked on the streets because I was Jewish. I remember once when I was roller-skating—I was about ten years old at the time—four kids came up to me, two grabbed me around the arms, and the others started punching me and calling me all kinds of derogatory names referring to Jews. Similar kinds of occurrences happened on a number of occasions. I can remember that and also more subtle types of prejudice, all of which perhaps can give me some sense of what blacks have to go through in this society.

I know that one can never truly appreciate what other people go through. But at least I have some experience as to what prejudice means, and I find it to be a terrible aspect of our society. My own experience is one of the reasons that I feel so strongly about the necessity of working hard to provide minorities with equal opportunities and fighting prejudice wherever one can.

Do you have any suggestions that you would make to the institution, on possible ways to improve or enhance the experience of blacks at MIT?

First, I would like to say that you personally have done much to improve the experience of blacks at MIT in many different ways. Also, the Office of Minority Education is a very valuable resource at the Institute, and Leo Osgood is doing an outstanding job running it, as Judy Jackson did in the past. I like the idea of the XL program, which gives minority students the feeling that they can do something academically that is extra and special. It

is very important for students to develop their self-confidence, because I think self-confidence to a large extent is a key to success. I think one has to do all kinds of things to increase the confidence of minority students, because society in general is telling them in subtle or not such subtle ways that they are not going to be successful. We have to do all that we can to counter such messages.

You've had experiences where you've been all over the world and communicated with all different types of people. One of the things that seems to come out from a number of you whom I've interviewed—who actually in just being yourselves have played a major role to really help to change, I think, people in many cases from being racist—is a quality that has a lot to do with traveling. You've seen a lot. My question to you is, what do you think helps?

I think you've made a very important point, and in fact maybe one that to some extent goes back to an earlier question about why the physics department has been more concerned about these issues. Physics perhaps has been more international than some of the other fields. I think being more international tends to give people a broader view of what goes on in the world. It takes you out of the attitudes of your own society—not that you can escape them totally, but it makes you temper them and helps you see things differently.

I think that experience is very valuable. I meet people from all spheres, from various countries, cultures, and races. From this, one realizes from experience that there is a common humanity and we all are just human beings. One also learns that there is no particular group of people that has a monopoly on abilities. You see that and you realize that what you have to do is ensure that all people have the proper opportunity to develop themselves to do what they can do best in society. That's what it's all about. Every group has people who can do things at the very top.

That's a very important point and it's good to hear you express it that way. Any other comment you would like to make on this subject matter before we stop?

Well, I'm trying to think if there's any summation. I think what I just said last is my summarizing comment. I really think that the goal has to be to provide equal opportunity for all people to do in society what they can do best, and to have no barricades preventing that. A society that doesn't have that is neither a just society nor a fair society. That

has to be the fundamental rule, and until we get there we haven't completed the job.

One thing for sure is that if we can have more people like you, we'll get there.

You're very kind.

I'm very serious about that, and I really think that in many ways you have demonstrated that effort. Your life represents that. I am privileged to have you come and talk. If those who read your comments could be as fortunate as I am to have been able to watch and to observe your life performance here at MIT, they would see it as a real privilege.

You're very kind to say that. The way I see myself is that this is what one is supposed to do. It's just obvious to me. It's nothing special.

WADE M. KORNEGAY

b. 1934, BS 1956 (chemistry and mathematics) North Carolina Central University, PhD 1961 (physical chemistry) University of California at Berkeley; from staff member to project leader, associate group leader (Radar Signature Studies), and group leader (Signature Studies and Analysis), Lincoln Laboratory, MIT, 1962-1986; division head (Radar Measurements), 1986- ; member, Vice President Humphrey's Task Force on Youth Motivation, 1966-1969; National Consortium for Black Professional Development, 1975-1979; recipient, Scientist of the Year award, National Society of Black Engineers, 1990.

I was born into a family of nine children—seven boys, two girls. People often ask me, “Which one were you?” and I have to stop and count. There were three after me, I guess, so that makes me number six. I was the next-to-youngest boy in the family. My mother died when I was six years old and in the first grade. I remember that very well. It was during the fall of my first year of school. My dad then abandoned the family and my grandmother took all of us in, took all the children in. I had two aunts who lived with her who were young women at the time. They raised us. My three older brothers dropped out of school after the ninth or tenth grade, but the rest of us all finished high school. I was the first in the family to go to college, not the first to desire to go to college. My two next-oldest brothers, who were two and four years older than I, were interested in engineering and in commercial art, respectively, and certainly had the capability to do something like that. The resources just weren't there to go to college.

I grew up in North Carolina, a small town in eastern North Carolina—Mount Olive. I always say the population was 6,000 when I was there, and 5,999 when I was away. The town was about twenty-five percent what we called Negroes in those days, blacks or African-Americans today. It was segregated. It was in the days of segregation, separate high school for each.

When you think about your elementary school and your high school, were there any role models that stood out, either in school or out of school?

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with Wade M. Kornegay in Cambridge, Massachusetts, 10 December 1996.

When I think of the elementary school, there were role models in the sense that I was always interested in learning. From the point of view of teachers, I can't think of one teacher that I did not enjoy being around, save one. In elementary school, I guess it was up about the fifth or sixth grade that I really began to identify what I would call role models who were external. Some of the teachers would have photos or pictures on the wall of well-known African-Americans at the time, and they began to ask the question of us, “What do you want to be when you grow up?” So that began to have some impact. Someone expected you to be something, so you began to develop some notion that you could be something, since people were asking those kinds of questions.

In the community there were what I would say were strong people who began to look up to

you, especially if you were a good student academically. I can remember I began selling newspapers when I was in the sixth grade. They would always refer to me, “Here comes my little professor.” I began to think that someone expected me to be a professor, so I began to comport myself in such a way. Then when I was about in the seventh grade, I found that while I was selling newspapers, I could sell some other stuff. So I began at the same time to order stuff from magazines and these kind of plaques you put on the wall that sparkle in the dark with “In God We Trust” and stuff like that. There was at least one fellow—Mr. Wynn—who would always buy anything I had to sell. He’d see me coming and say, “What do you have today?” He would buy anything I had. Sometimes it would be razor blades. It would be a whole assortment of things. So I would make a little profit on that. I began to think, “Gee, I could go into business in some way eventually.” I had the notion at one time, when someone had some used clothes you could order by the pound, “Well maybe I could order these and sell them,” but I never did. But I’m certain Mr. Wynn would have bought some of these. I always kind of respected him. He had confidence in me. Many of my customers were women who also were very supportive. I can remember when I was in the ninth grade, I was selling the brass plaques that you could order for about five bucks or four bucks—whatever it was—and have your name put on it and you could put it on your door. Well, still fifty years later now when I go to North Carolina, there are one or two old ladies who have those plaques on their door and they remember that I sold them to them. They’re beautiful.

So it’s those kinds of things that I think had some impact. Now don’t ask me how did that impact or help. Those are the kinds of things that reassure you that you can do something as opposed to that you can’t do something, which I thought was important.

Where did you get the idea or how did you end up deciding to go to your alma mater, your undergraduate school? How did you make that choice?

Well, part of it was financial. First let me say that when I grew up in the family, I knew that the option was to get an education or to end up working on the farm or being somebody’s hired help. Often when we boys became unruly, my grand-

mother would say, “If you boys don’t apply yourself and do well in school, I’ll buy a farm and we’ll live on the farm.” I knew what living on a farm meant. The other thing she would often say—she would never say, “I want you to be this or that or that”—was, “I want you boys to make something of yourself, to be somebody.” So you began to look at it from that perspective.

I went through high school expecting that I would go to college. I knew nothing about the resources or how that would be achieved or what it cost or anything like that. But as I got into the junior year, there was a math professor I had, Mr. Watson, who began to talk about various fields—accounting, for example—and what his experience as a mathematician had been living in Washington during the Second World War. There were many blacks who had masters’ and Ph.D’s who were working in the post office and working menial jobs. But he said things were changing and that people with Ph.D. degrees knew about a lot of stuff and knew that most of them could do almost anything and that if you got higher education you could do well. So I began to think very positively that way. As I approached my senior year, I began to fill out applications for fellowships with the idea, “If I don’t ask, I won’t know what the answer is. The answer I get, if I get no, that’s no worse than the answer that I had when I don’t apply, because the answer is no if you don’t ask the question.”

I applied for an NROTC fellowship, as my older brother did, which he didn’t get. He wanted to go to Howard University for engineering. I applied to a number of schools. I had an English and Thespian teacher because I participated in a number of plays in high school. I had looked into North Carolina Central University and was taken over for a visit on one occasion. I knew they had a business school, and I was interested because of this math professor in terms of business as a possibility. I wrote off to a couple of schools in New York, including New York University. New York University—this is the one in lower Manhattan—offered me a fellowship for several hundred dollars per semester, and that looked very good. Then finally, two people in my class of fifty-two received the James E. Shepherd scholarships the first year that they were given, for two years. So that looked more attractive than the six or seven hundred dollars I would have gotten at New York University.

That money that I got paid for my tuition for two full years, so I decided to go to North Carolina Central for that reason.

At the time I accepted, I was going to go to the business school and get me a degree in accounting. That summer I was reading a newspaper and having no luck at getting a job at the local post office. In the *Raleigh News Observer*, there was an advertisement for a job in upstate New York for a hospital attendant. This hospital was a school for mentally retarded, which I learned later. I wrote off, got the application, applied for the job, and actually got the job. I went off and worked and saved my money in the summer. While I was there, I became interested in medicine. I said, "I'm going to major in medicine." So by the time I went off to North Carolina Central, I decided I was going into medicine. The people there at the hospital had encouraged me. They were very interested in the fact that I would be going into medicine. That's how I ended up going to Central.

You're saying too that's how you sort of began to focus in the sciences as well.

That's true. When I arrived at Central, there was a shock. You come out of high school, you're the valedictorian of your class, people begin to tell you you're smart, you think you're smart, you get to college, they elect you president of your freshman class in college—and you begin to learn what you don't know. Having gone to a small high school, you began to learn that the guys who came from Chester, Pennsylvania, the guys who came from New York, New Jersey, "Gee, they've had calculus. I don't even know what the word means. I've heard the word trigonometry." So you had to take some stuff that you didn't have to take before.

The other thing I began to learn, I had had biology and it began to sink into me, "Hey, in biology there are things you have to do that I'm not good at. You have to look through a microscope. I can do that, but you have to be able to sketch out what you see in the microscope and, gee, I may have trouble at that." Plus, I decided that I was more interested in things that were stronger analytical things than that which required just a lot of memory. Not that I couldn't memorize, I thought that doing a lot of memory wasn't very taxing. It came very easy. So I then decided that I would major in math and chemistry as opposed to biology. But I still had not decided not to go into

medicine. It was at a later time that I decided that. It was through the influence of the people in the math and chemistry departments that I decided to go ahead for a Ph.D. in one of those fields.

You mentioned influence. How would you describe highlights of your education at North Carolina Central?

Well, there was a broad interest. Let me put it this way, there were those who were interested in me as a person—not in terms of interested in Wade, but interested in a person that's a collective body of people, interested in seeing me succeed, interested in seeing me achieve. In part they were interested in me, in part they were interested in propagating themselves in terms of their own achievements, in terms of their own capability and expertise. I saw that in my math teacher, I saw that in my English teacher and all of that in terms of insisting upon the best in us—not letting us do short cuts, at times shocking us. I can remember in my freshman year of English, I had the toughest professor there was and I tried to get from under him—Dr. Farrison. He said, "Leave a margin of an inch on the left side of your page." I passed in my paper and for some reason, I guess I didn't carry a ruler in school, it must have been less than the one inch he required and he took off twenty-five points. I abbreviated February—it was February of that year—and he took off another fifteen points. I went to him and I said, "Dr. Farrison, I got everything right. You indicate I got everything right." He said, "This margin, I told you what it should be. Don't do that anymore and you won't lose the points." I said, "I put February here." He said, "F-E-B, period. How do I know you know how to spell February?" That's the last time I remember abbreviating February.

So you learn those things, things that are sloppy. For example, I remember on another occasion there was a rule that if it's "do not," write "do not," don't write "don't." Don't use apostrophes. I used it once in a theme I had to write, a two-page theme. I got an F. It didn't matter how good it was. You do that once. So that started discipline. You might say it was unnecessary, it was puny, it was retribution, but you learn from that and that's a lesson for life. You must give attention to details that could make a difference somehow.

It sounds like you're talking about some real strong figures during that period. Let me move from there, unless there's something else you can think of. Obviously you

did exceedingly well at your undergraduate institution. If you can recall in general what your thinking was getting ready to decide what you were going to do after you left your undergraduate school, do you have any sense about how you decided what you would do and what you actually did with the help of others or yourself? How did you come to the point where you decided where you were going to go and what you did from there?

I don't know. At no point do I recall asking someone, "What should I do?" You know, "I got these choices to make. I have these eleven or twelve graduate schools that have accepted me for graduate work, what should I do?" I always looked at it from the point of view of what do I want and what might help me most in terms of heading toward the goal I was going toward. At some point in my undergraduate studies, I decided that I was going to earn a Ph.D. degree at a major university in the U.S., that I was going to do research, and that I was going to teach and do those things in combination. That was my objective. Once I decided that, it didn't matter what school. Of course, you had professors. My chemistry professor had gone to Wisconsin and he was interested in Wisconsin. Another professor had gone to another major university, Illinois, and was interested in steering me toward Illinois. I applied to those schools as well as others, and got accepted to all the graduate schools that I had chosen.

At the same time, I applied for a number of other fellowships at the suggestion of Dr. Hughley, who was then, as you know, at Central and was responsible for our inspirational concerns. He had approached a number of us who were doing well in class and said, "Have you considered applying for this or that fellowship?" There was the Danforth Fellowship, which pays for all of your educational experience for four years providing you're going into university teaching. There was the Fulbright, which is competed for nationally for study in a number of countries for a period of a year, and that's administered under the State Department. Then there was the Rhodes Scholars program. I applied for all of those and moved to various stages through each one of them. I ended up receiving both the Fulbright and the Danforth Graduate Teaching Fellowship. Once I received these grants, the question was, do I want to do my graduate work now or do I really want to risk a gap? That's the time when I really had discussion with people in terms of, "Do I want to go off to

Germany and study for a year and interrupt my chain of progression toward a Ph.D.?"—which I figured I could get in about four years—or, "Do I really want to get that experience?" I did discuss that with other persons and listened to advice. In fact, part of the advice I sought was from my German professor, who had taught me German for four years. He had just been appointed to head the U.S. Agency for International Development, USAID. He suggested that I would find the experience in Germany invaluable, so I did decide to go ahead and study at the University of Bonn for a year.

I went and studied physics and chemistry for a year and never regretted that. In fact, I decided that I was going to do my doctorate there and started studying for the exam. But I changed my mind and decided to come back to the States. Then the eleven schools that had accepted me for graduate school, I rescinded those offers and actually applied to the University of California at Berkeley because there was some work going on by a professor who had just written a book on chemical kinetics that I found very interesting. I decided I would apply there. I got in and then decided to go to Berkeley when I came back to the U.S.

When did you give up on the idea of medicine? You mentioned earlier that at one point you decided that you wanted to go into medicine.

Well, I've found that it's not that you decide you don't want to do something, you decide you do want to do something. So I was deciding that I did want to go into another field. The other thing that came up was the reality of, "Hey, who is going to give me money and where am I going to get money to go to medical school?" I was reading about these fellowships and schools were offering you at least some fellowships for part of your tuition or rescinding tuition, especially in some of these technical fields, but I wasn't reading anything in the medical fields. Perhaps they were there and nobody was just calling it to my attention at the time. So that reality began to set in. It was more that than not being interested in medicine. At first, I was beginning to find the technical field, the research aspect of it, very challenging and rewarding in terms of mental activity. I was very interested not only in chemistry and physics, but math also. I felt that the research field would give me a very

good opportunity to apply my math more than the medical field, albeit that could have been wrong. That was my perception at that particular time.

Think about Berkeley, where you finally decided to do your graduate work. What comes to mind as far as the highlights of that experience?

It wasn't just the graduate school. One is so absorbed in terms of what you're there for. But you know you aren't there for enjoyment. I'm trying to recall an expression. I asked my daughter who is in graduate school now working for her Ph.D., "Are you enjoying it?" She said, "Dad, I'm not here to enjoy it. I'm here to endure it." I think that was well put because, as I look back on it now, I was there to endure it. The highlight again for me was, number one, finding an environment that I could function in. As an African-American, you approach various stages of things with some trepidation. How will I be received?

Let me go back. Just out of high school, when I was going off to upstate New York to work at this hospital for the mentally retarded, I can remember after I got the letter of acceptance with my hundred and some bucks every two weeks and I was all excited, my history professor looked at me and said, "Do they know what hue you are?" "Oh my gosh, what does he mean?" I always had the feeling of looking at things positively, so I began to worry and be concerned about myself only at that time when the question was raised. I had some trepidation when I approached the place that Monday morning, to approach work. It was without cause. Things went very well. The same thing when I went to Germany. I had heard tales about Germany and the African-American soldiers who served in the Second World War. The Germans had been told by some of the white soldiers that African-Americans had tails. Therefore, I wondered, "What will they think about me? How will I be received?" Those kinds of things would concern one, especially if you've grown up in an environment that's as segregated as it was in those days.

So I did not approach Berkeley without some of those reservations, but also with the assurance that, "Hey, I'm not out here to be loved. Just respect me and I can make it." That aside, let me say something. You asked about the highlights. The highlight was being in an environment where I could actually function, actually live with people—not

only American, but people of all races and nationalities. I lived in the International House for two years, where people from about fifty countries lived. That living environment was invigorating, having just come from Germany, having had that taste—and traveling a lot—of internationalism. Also, being in a department where, albeit I was the only African-American in it, I seemed to have been well-received. Things worked very well. I had nothing but very good experiences in my graduate studies, which is unlike what has happened at many places at major universities across this country in the last twenty years.

Yes. And you're talking about what date?

Late 1950s, 1957 when I went to Berkeley.

What I hear you saying is that you had a real positive experience.

Yes. But I think it has to do with numbers. My experience has been that when there are very few African-Americans, very few of anybody, people seem to be less threatened than when there are more. And the more doesn't have to be large numbers. For some reason, three or four of us appear as large numbers to some people.

Does anybody stand out very strongly in that period of your education, like mentors or people who were very influential?

Well, there were a couple of professors. I got my doctorate in physical chemistry, which is a cross-breed between a lot of stuff in physics and chemistry, so it required me to have lots of interaction. I have always looked to see where I can get advice. Advice sometimes comes to you in subtle ways. I can remember during my first year, I was concerned because I came from an environment where you get the bachelor's degree, then you get the master's degree, then you get the Ph.D. Well, I had been admitted to Berkeley for the Ph.D. program, so my advisor—of course, he was a Caucasian fellow—I went in to him one day and I asked, "Professor Connick, what do I need to do to get my master's?" He looked up at me and said, "Young man, we invited you here as a doctoral candidate. We reserve the master's that you referred to for those who don't make it." I only said, "Thank you, sir," and left. I never asked another question about getting a master's, period.

I prize that kind of openness and I saw one or two people who dropped out, who I assume got

master's degrees and didn't make it. They had a class of seventy who started out. In that class of seventy—one female Caucasian, one African-American, and sixty-eight white Americans. No Asians in that class. Berkeley has a large Asian population now.

That's a huge change.
Yes, it is.

When you go back there now, probably the majority in your particular field would be Asians.

Yes, at least about half Asians. There has been a population shift in that sense.

How did you come to MIT?

There again, when I came out, I took a year's post-doctorate. You may argue that I was prolonging remaining a student, which perhaps would have been in part true.

Enjoy that education!

The educational experience. It does get good at the end when you leave, you know, and you've got to go face the real world. Then, as you finish, you start thinking about earning a living and you start looking in terms of what people are paying in different places. But I had a commitment to go into teaching, because I had gone to graduate school for three and a half years as a Danforth Graduate Teaching Fellow. I did apply for teaching posts at a number of universities. I applied for teaching posts at many major universities for that time-frame—and perhaps for today—although I was not admitted. The process is, you just don't fill out an application because you want to go to University X. The professor will approach you and then say, "Hey, you should apply to these universities," which means he has put in a little bit of a good word for you. Among those were the University of California at Los Angeles, Columbia, and several others.

So it wasn't a matter of being directed to second-rate universities. They were very good universities. I interviewed with Harvey Mudd and some of the others with disappointing results. I'll not recite those. But then it became a matter of what was the next best thing. As I said earlier, I was interested in doing research, not just teaching. I had an option of going to teach. I was made offers at a number of small colleges where I could go and teach. But when asked about research, "Yes, we encourage research," but the teaching

load was sixteen hours, which meant that they encouraged research but did not allow a lot of time for research, as opposed to the nine hours or so that most of the major universities were requiring in those particular days. So then I had to make the decision, "Gee, I want to do teaching and research." If I had to choose one, I was going to choose to remain strong in the research area and take the chance of later shifting back into the teaching field. So I conferred with the people at the Danforth Foundation.

At that point I began to apply to a number of places associated with universities, as well as to some industries not associated with universities, because in those days the aerospace industry was very strong. Sputnik had flown—the satellite, Sputnik, that the Russians had flown in '57. The U.S. was beginning to move into space, that is, in the late 1950s and early '60s. So the aircraft industry and other aerospace industries were growing, and I learned about a place called MIT that had a large research laboratory named the Lincoln Laboratory. I applied to that and was accepted. I was accepted at several other places. Then it becomes a matter of, do you take the place with the most money or what? I began to ask myself what each one had to offer. At first I said, "Being poor, I'll take the place with the most money," which was not MIT. After thinking about it, I conferred with another colleague of mine who was a post-doc who had come out and interviewed at Lincoln. We discussed it and he began to point out what he saw as being the positive things. He was going off to the University of Pennsylvania. He had gotten a position at a major teaching university. As a result of some of those conversations, looking at the pros and cons and looking at the fact that I was recently wed and my wife had her family on the East Coast, I said, "Gee, if I stay in California, we are going to be making many trips back to the East Coast and that will cost a lot of money." I decided that we would live on the East Coast for that reason.

There are composite reasons that I ended up at MIT. I wanted to be at a place that was strong technically, a place that had a good reputation, a place based on a little exposure to the point where my interviews seemed to be in an environment that I thought I could work inside. There again, I approached MIT with a positive attitude and expectation. Show me that you are as good as I

think you are, that you are as receptive as I think you are.

I have to come back and ask, is there anything you can say about those disappointments that you mentioned?

With any disappointment, the thing is always the lack of forthrightness of individuals—whether it's in terms of finding a place to live or whether it's in terms of employment. It has nothing to do with how good you are. Let me just cite a couple things. I visited UCLA, gave the seminar as was required for candidates, talked to about a half dozen professor as was required. Excellent reception, et cetera. I talked to the lead person—Harold Urey, who was a Nobel laureate. I spoke with him. As we talked, his talk was less about my work. His conversation went, “You know, down at Southern University”—an African-American university—“they've got some positions down there you might be interested in.” So it was obvious that he was not seriously considering me for UCLA, based on those comments. He was telling me where I would be well received.

The other one was at Harvey Mudd, which is in Claremont, California. It's one of the Claremont Colleges, a conglomerate of very good liberal arts colleges that are small and would be excellent, an ideal place to start. I remember the fellow—it was one of those places again that was recommended by a professor—came up and interviewed me at Berkeley. He never invited me down to interview at Harvey Mudd. He came back to Berkeley to have lunch. He was chairman of the department of chemistry. He started out by saying, “You know, you will have a problem finding a place to live in Claremont.” My response was, “Gee, I was looking for a place to work. I'll take care of myself in terms of finding a place to live.” So that kind of fizzled out there. The fact is that he went through the motions knowing that he never would make me an offer. It may be that after the first interview he went back and sized up his people and raised the “What if one were to come here?” question, and did not get an encouraging response. Maybe that's the reason he came off that way.

Now, those responses are no different than the responses you get when you look at the housing in those places. I remember—my wife and I, when we first got married in Berkeley—the woman who we had called through a newspaper ad that described a particular house. We were plan-

ning to move from a one-bedroom to a two-bedroom apartment. The woman said, “Well, I have a place that you might be interested in. This young man is supposed to be going into military service. If he goes, you'll have first option on it.” So one afternoon I came to the lab. About six o'clock, I got a call. She said, “The place is free. Would you like to come take a look at it?” I said, “Certainly, but my wife's at work. I'll come over.” It was only about three blocks to the house. I drove over and parked. She came up. Her car was parked. I walked around the house and I came around the house. She came and started feeling her pockets. She said, “Oh, I forgot the key.” I looked at her. “What do you mean, you forgot the key? You called me, I didn't call you. You said you would meet me here. You didn't forget the key.”

That's no different to me than the university situations. I could give you a litany of many others over the past thirty years that are things of that sort.

Talk a little bit about your overall experience at MIT. Identify what you would consider as significant things that have happened over your years here. Again, we're talking about a fairly long span. Overall, what can you say about the time you've spent here?

Let me at least treat it at a top level and not make it any kind of griping session or go overboard in terms of being laudatory about things that we need not be laudatory about. I came to MIT, as you well know, in the early 1960s, in '62. That was certainly well before the days of affirmative action. It was in the days of riots, et cetera, in the South, cross burnings, marches and things of that sort. Those overtones existed across the United States. I came into a research environment. There again, I was well received as a peer among equals in the technical sense. I found MIT a very welcoming place when I came here. If you ask what stands out, what stands out for me was the fact that I had considerable freedom in terms of my research project—being given general directions, but being left to succeed or fail in terms of how my project went. Fortunately, I was one who did not require day-to-day direction, that kind of thing. I learned from early childhood to find a way to do things, and if I needed resources to go and ask. I had the idea that if you don't ask, you don't get. If you don't ask, the answer is no; if you do ask, the worst answer you can get is no. So always ask.

In those early years, I can't think of any outstanding things that were impediments. I can think of one or two things that happened that I thought were positive. There were two instances I remember. Someone at the Institute was responding in 1966. Then Vice President Humphrey had a program called Plans for Progress and was drawing upon, was pulling together about two hundred young people—African-Americans—from across the country, from industry, from academia, who in teams of three, four, or five people would go out and visit universities, spend one or two days talking to young people in the universities about careers, career opportunities, and moving forward. It was then that a vice president of MIT, I forget his name, wrote and asked me if I would be willing to have the president nominate me to be a member of that team. I accepted and went and served for about three years, and I found that was a door that was open.

Those are the things that happened in the early years that haven't happened frequently in the later years. As a result of that, I was invited to the inauguration of the head of the Atomic Energy Commission. I was later invited to the White House. I went camping one weekend, got home, and there was a telegram in my mailbox saying that President Johnson invited me to be present that Monday morning at an eleven o'clock ceremony of the installation of this person in the East Wing. Now there again is evidence of the freedom of the place that I work. It's Sunday night I got home. They want you to be there Monday morning, and do you ask some boss can you go? I made the decision that I was going and I went. The Laboratory paid the expenses for it. Nobody raised a question about it.

So those I found very interesting experiences that, of course, had reverberations later on in my career—the people I meet and things of that sort. Those things don't happen to us often these days.

No, I can imagine not. One of the things I would like for you to talk about is being the first in several regards. You're talking about the early 1960s up to the '90s. When you look at your career, you've been able to succeed, to get all of the appropriate promotions—all the way from group leader and then manager, and all the way up to division head, which is a first in MIT's history. Basically, for a large portion of that time, you were the only African-American in this professional group. What

kinds of skills, what kind of advice would you give to someone in terms of what you've learned about how to go through a maze like that?

I think there is no recipe, but there are ingredients that one must be aware of. Maybe I speak from hindsight now. I certainly didn't stand at some time some thirty years ago and lay out some strategy and say, "This is the strategy I'm going to follow." If I laid out a strategy, it was, "I'm going to be good. I'm going to be very good. I'm going to remember what my ninth-grade English teacher told me." When I went to Miss Davis and said, "Miss Davis, I did everything you told me to do. I passed in all my homework, I aced it. Why do I have a B-plus? I'm not on the A honor roll this month." She looked at me and she said, "You didn't have to try," telling me I did not go beyond what was expected. So from that day forward, I didn't just do what was expected. It was, "Hey, I'm going to be as good or I'm going to be better than everyone else." I find that it's important to try to be better than everyone else. Being the best is no assurance. That's only an ingredient.

The other thing, I have something that I call the four A's of things. I think it's good to have a good attitude about things; and, of course, to have aspiration; it doesn't hurt to have innate ability; and also, to achieve something. When I talk to students, I quite often use this thing that I call "journey to success." I draw it in terms of a Venn diagram, three circles that overlap. It's not just having these things individually, it's being able to find a coalescence among them, to bring them together. That's important. So that's a beginning. Quite often we think, "Hey, I'm smart. I'm the valedictorian. I'm the best at this. They will recognize me. I finished MIT, the best school in the country. Therefore, they'll give me a job and I'll do well." Yes, they'll give you a job, but whether you do well depends on these other things—whether you have a good attitude in terms of approaching what you are doing, and whether you have some aspirations, some goals of where you are headed and what you want out of it.

The other thing I found helpful is what I call a game, a triad of things, one's personal mission. What are you looking for? What do you want? What I was looking for was being the best and achieving the most. I've always felt that if it's human and somebody can do it, why not me? I've always looked around. At first you approach these

things with apprehension, “Let me not lecture you.” At first you’re sitting there and the teacher is teaching you, “Oh gosh, they are so bright, they are so smart.” That’s when you’re fresh. By the time you’re a senior, you know a lot of that stuff yourself and you begin to think, “Oh I could do that,” especially when occasionally you get up in class and you teach and do stuff. So that’s the personal mission. The next thing is in terms of you’re on a job, knowing what is the requirement of the job. People don’t hire you just to come and sit at a desk. They hire you because there’s a job to be done and you need to understand what that job is. Thirdly, an awareness of the environment in which you work. Being at Bell Labs is different from being at MIT, it’s different from being at the University of California, it’s different from being at the University of North Carolina. They’re all different.

So being able to bring those three things together—my personal mission; the requirement of the job that I am called to do, that I have obligated myself to do, for which I am being paid; and the environment in which I function. An awareness of those things has helped me a great deal.

I would assume then, if you were giving advice, your advice would be very much along those lines.

Yes. A quote I like from James Thurber—and I think as African-Americans it’s very instructive to take it into account—is, “Let us not look back in anger or forward in fear, but around in awareness.” That’s all these things I’ve just mentioned, what I call the area of awareness. Look around you where you are now in awareness of that situation. Don’t spend a lot of energy being angry about the past or being afraid of the future.

Based on your own experience, is there any advice you might offer to other blacks who are entering or planning to enter the MIT environment? What advice would you give a young black scientist coming to MIT?

Again, I would turn to those things. I would first say, “Do your knitting well, but don’t stick to your knitting alone.” Quite often as I talk to young people, there’s the attitude, “I got my degree, I’m good at this, and this is what I want to do and I’ll leave the politics to someone else.” Awareness, as I mentioned previously, that’s politics. Some of that is politics—knowing who the people are around you, knowing whom you can trust, knowing whose judgment you can respect, knowing who it

is that is likely to take your work and use it as their own as opposed to giving you appropriate credit for it. And testing the waters on those things—not being so fearful that, “Gee, I won’t share this with anybody because I know they’ll steal it from me,” but at least try anything once. Give them a chance. You’ll be taken once, maybe, but don’t be taken a second time.

And the other thing is speaking up. There are little things. Let’s say you’re in a work environment like the place where I work, Lincoln Laboratory at MIT. Work environments include working and include meetings. You’re sticking to your knitting and you’re doing your work, and there’s a special meeting called to discuss a different technical topic on the design of a new radar they’re thinking about. “Well, that’s of interest, but I know that stuff. Should I go?” Yes, you should go to some of those meetings, even if they turn out to be a waste of time, for two reasons: number one, you may learn something, you don’t know everything; and number two, your presence is recognized by other people, or your lack of presence can be taken as indicating you are not interested. “I never see Wade here. He must not be interested in this.” Now how do I know that? Not because somebody tells me that, but because of comments people make about other people.

I had a situation where there was a young fellow I had just promoted. He happened to be Caucasian. The next supervisor up had observed this young fellow. “Gee, I thought you guys said he was good. I noticed that he came to a meeting”—there had only been one meeting, now—“and he snuck to the back of the room. If he’s going to be a manager, he shouldn’t be sitting in the back of the room.” Now, he wouldn’t tell that guy that, and nobody would have told me that. That’s the nature of the environment. But I found a way to convey it to this person without saying So-and-So said so. But what you risk, by the way, and this is the thing you have to be cognitive of, is not being defensive. If I go to this person and I start saying, “George, when you go in a room as a manager and you want to be perceived as being a leader, you ought to go up there in the front of the room. It’s to your advantage.” Leave it at that. If I go there and say, “They say you’re sitting in the back of the room.” “Who says so?” and he gets defensive. Well, I’m going to leave him alone and let him rot. And the person will do that to you. It

might be more likely to happen to you as an African-American.

The last thing, you must seek information. Quite often it will not be laid on your desk or at your doorstep. You must ask what's going on. If there are meetings and you're not invited, you ask, "What was that meeting about?" Don't get defensive and talk about, "Why wasn't I invited?" Find out what it was about and how often do they happen and show up the next time. Or ask, "Is there any reason that I shouldn't attend?" Don't ask, "May I attend?" Ask, "Is there any reason that I shouldn't attend?" Those are two different questions.

Another area is to develop some kind of liaison outside of your environment. Your environment can wrap you up a hundred percent of your time—that is, your workplace. You never get to go to any meetings anyway. Everybody else is going to meetings and you are so dedicated to doing your job, you think if you take two days off to go to San Francisco or somewhere to a professional conference that you're wasting time. You're not. The guy next to you down the hall is going to those meetings. You should take the time to do that yourself, develop some liaisons outside. You may decide to change jobs some day. You know some people some place else. You make social contacts. You may have decided that, "Gee, I'm an astronomer. This meeting is interesting, but I know that stuff. Those are old papers." Well, go to the meeting. You don't need to go to all of the sessions. Those things can be critical, but don't overdo it.

If you had to give advice to MIT regarding how to do better relative to people like yourself, what kind of advice would you give in terms of how we can improve on the black presence in the scientific area?

Let me at least do what I think is a diagnostic of what I think the environment is at places like MIT. It may not be unique to MIT, but that's no excuse. If MIT takes the position of it's the best, we seek the brightest, we seek the smartest, and always seek out the best—we do seek out the best—well, seeking out the best sometimes may mean not being conventional. Also a place like MIT, when it comes to minorities, blacks, and so on, they always want to make certain that everything is equal, everybody has a fair chance at the position. But when it comes to some other people, if there's

someone at Berkeley or someone at the University of Texas who is just right for this position, the person is sought out, is pinpointed, is nurtured. He's at Texas, you think he could benefit from a year at Harvard before MIT? Word goes out, he goes there, and you tell me that doesn't happen? I challenge you: It does happen. Eventually, he'll end up at MIT and he's declared to be the best and the smartest.

Those kinds of things seldom happen to blacks, because the interest that I experienced at a place like North Carolina Central and my segregated high school does not exist. That supportive environment does not exist at MIT, I believe. There are few that have your vested interest at heart. It's reflected in terms of those who hire at all levels, who have hired the best and the brightest. But when it comes to African-Americans, there is a tendency to hire people that they are certain will not fail. Select out people who will have a high probability of not failing, a high probability of being successful. I think that's good, but sometimes you have to take a chance on individuals and take a chance that if it doesn't work out, we will fire him or her. There's not enough of that. I think that means setting the tone of expectation from on high. It's not a matter of setting quotas, it's a matter of targeting. If in an area where you do not have people of color, you don't hire two this year or three this year but over a period of a couple of years you're hiring five people, why not? What have you done toward seeking out blacks short of advertising in a trade magazine, advertising in local newspapers? Have you sought people? How many times have people made contacts at conferences and on the spot invited people to come in to give lectures and things of that sort? Setting that kind of tone of expectation among the leadership is very important. Sometimes it's just a matter of asking, "How are you doing?" or "What are you doing in this area?"

There is a reluctance to ask those kinds of questions, at least in the environment in which I work. I would think it's like the environment of MIT. When someone compares how they're doing to how the rest of MIT is doing, that is not a good model. When you ask, "How are you doing in this area?" "Well, I'm doing better than some of the other departments." That's not a good answer. It may mean that neither of you are doing anything.

I think that as we go through our careers, one of the things when I've encountered some blacks who did not make it or who were here and left or were asked to leave and things of that sort, quite often it's a case where all of the signs were missing, were ignored in terms of things that could have been done to turn it around early on. Only after it had reached the pinnacle of someone reaching the decision that this person has performed poorly for four years or five years and we're going to terminate their employment, the person then starts challenging that and saying, "What's wrong with me?" Many of the signs were there early on, in a review—a performance review—which is done throughout the Institute in various forms, sometimes written, sometimes oral. Someone makes a comment and someone comes in and they give you a salary increase, say four percent or three percent or whatever it is at that particular time. You are elated by that increase and the person will say, "You know, you're doing pretty good. Your work is acceptable."

You listen only for the good news. I don't know whether we have a propensity to listen only for good news or not. Maybe that's a human trait. We hear that and we don't hear the undertones, we don't hear the "but" that's not spoken. We won't dare to ask, "Are there areas you think I can improve in?" We won't ask that specifically—putting the manager, you could say, on the spot to give you some specific guidance in areas. "You're doing very well, but you have some communication problems." "What is the communication problem?" "The run-in you had last month with someone down the hall, or your refusal to let someone else take your work and represent it as their own." The time to deal with that is then, not two years later. Two years later it's looked upon as fodder that's being used to try to keep you from being put out of the place.

I think that's one of the things that you have to be very attuned to. You must listen in this environment. You must listen to what's being said—not defensively, not in a "What do you mean?" sense, but in a sense of "I don't understand, can you explain that a little better? Run that past me again since I want to understand." This as opposed to a sense of "I don't believe it," or "You're wrong," because only in the former sense will you get people to open up. Although you know he's lying and he's wrong, if you tell a person they're

lying, they're going to choke up and they'll tell you nothing.

Awareness, again, I think is a great thing. I can remember one of my promotions. Someone wanted to promote me to an assistant something. I said, "Tell the director thank you, but I'm disappointed. I should be an associate." I knew what the difference meant. It wasn't just money. Money had nothing to do with it. It meant influence, respect, and achievement. I knew when I met with the director. I said, "A lot of other people have been promoted over my head. I think I'm just as good as they are. If you want to make me an assistant, what that means is that I'm not appreciated and I should be someplace else." The answer was, "Oh, no, no, no. We want you to be an associate." I could have blown up and said, "You so-and-so! You're lying. If you wanted me to be one, you would have done it in the first place." Again, that was my aspiration. I know what my objective is. My objective is to get the position.

Basically, what you're saying is that you let people know what your expectations are.

BERNARD J. FRIEDEN

b. 1930, BA 1951 (English) Cornell University, MA 1953 (English) Pennsylvania State University, MCP 1957 (city planning) and PhD 1962 (city and regional planning) MIT; joined the MIT faculty in 1961, after serving as an instructor and research fellow, 1957-1961; professor of city planning, 1969-1989; Ford professor of urban development, 1989- ; director, MIT-Harvard Joint Center for Urban Studies, 1971-1975; director of research, MIT Center for Real Estate Development, 1985-1987; chair, MIT Faculty, 1987-1989; associate dean, School of Architecture and Planning, 1993- ; editor, *Journal of the American Institute of Planners*, 1962-1965; member, White House Task Force on Model Cities, 1969.

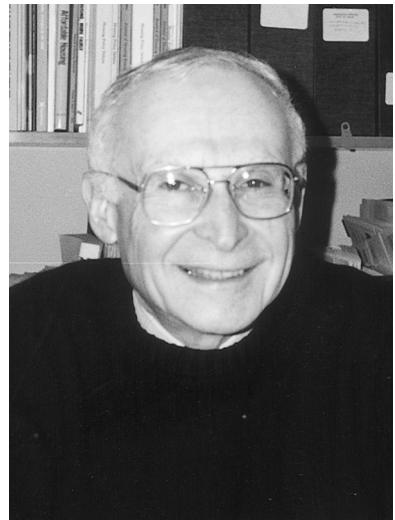

I grew up in New York City. My parents moved around quite a lot, as people did during the Depression, so it was in different parts of the city, but New York is really my background. One thing that does come to mind about that background is when I was going through the New York City schools, particularly high school—it was around the end of World War II and the first few years afterwards—it was clear to me, thinking back now although maybe it wasn't so clear at the time, that the school system was taking special pains to encourage good race relations. The school that I was in was overwhelmingly white. If there were blacks there, it couldn't have been more than half a dozen out of a school of a few thousand. The sort of thing they did was they invited a black man with a Ph.D. to come and speak to the school assembly. They didn't say much about why they invited him, but the purpose was obvious—that they wanted us to see that there were educated black people who were interesting and had intelligent things to say. They kept referring to him as Dr. Hunton all the time. I think they got a message across.

Also, in reading recent things in which people talked about the unfortunate way some blacks have been represented in the movies in the United States, I recalled that one of my high school teachers led a discussion on this topic. I think it was even in the early days of high school. She was obviously far ahead of her time. She was asking us, "Can you recall any movies in which black people were treated in a positive or a neutral sort of way?" It was hard. I remember one fellow mentioned the

movie *Sahara* with Humphrey Bogart, a World War II movie, where in North Africa, Bogart meets a black soldier from some part of Africa and he talks to him. It's just a very sort of warm person-to-person conversation where Bogart asks him, "Well, is there polygamy in your country?" He says, "Yes there is, but I have only one wife because my wife wouldn't like it if I had more than one." That sort of thing was very rare. The person was presented in a very positive light. The teacher obviously made her point because that was about the only film that people could think of where that had happened.

There was a general push toward what would be called political correctness these days. But it was under the influence of all the racial and religious persecutions of World War II, I'm sure, that the New York City school system was bending over

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with Bernard J. Frieden in Cambridge, Massachusetts, 24 February 1997.

backward to encourage tolerance and a respect for other people. I think that had an impact on me, probably more than I realized at the time.

Another thing I would say is that just growing up in New York is a course in sociology by itself. You're certainly aware of the differences among people and the many different ethnic groups that surround you, although in my own neighborhood many white ethnic groups were represented, but there were very few black people. Throughout that early part of my life when I did meet blacks, I seemed to get along very well with them and they seemed like very nice people. My parents sent me to a camp that was run by a settlement house and the counselor was a black fellow. I liked him very much, as most of the kids did. One of the other kids in the bunk was black and I was friendly with him, and that sort of thing seemed to happen to me repeatedly. It happened again when I was in the Army that a fair number of the permanent soldiers who weren't draftees like me—I was in during the Korean War—a fair number of the permanent people on base who did basic training for us or had other jobs around the base were black. With one or two exceptions, they were very nice guys. Everybody liked them and I certainly did.

When I was stationed in Germany, one of the guys I was friendliest with was a black fellow from Boston. We did some traveling together around Europe. I gave him some help in a racist situation that developed on the base. I transferred from one outfit to another, but on the same base, and I had been in a very desirable room. It had a group of only seven or eight people in it, whereas most people were sleeping in very large dormitory-like halls of maybe fifty people. I wanted him to get my bed when I left. It was sort of an unofficial, an informal custom that you could do that. So I brought him around to show him the place, and it was obvious that he was there and he was going to get my bed. I didn't know they were racist. They weren't from the South, but they hated the idea. They thought they had a private club there and they began to make nasty remarks to me and nasty remarks to him. I asked him if he wanted to go ahead with this anyway and he said he did, he didn't mind.

So we did. I kept track of him in that situation to see whether I could be helpful, but actually he solved it by himself. People were making nasty

remarks to him, particularly at night when the lights were out. You couldn't see who was talking, so they would make nasty remarks and he said he just laughed. He would laugh really hard and they wouldn't know what to make of that. I guess what I'm saying is I had a kind of indoctrination because of the times and the way the school system was run, and I had good personal experiences.

What period did that cover?

Well, I was born in 1930. I graduated from high school in '47, so the years when I was getting my strong indoctrination would have been about '43 to '47. I was in the Army during the Korean War, from '52 to '54.

Say a little bit about your parents' background.

My parents were both born in the U.S., but their parents were not. My mother's family came from a little village near Bialystok in what's now Poland, but was part of Russia at the time. My grandparents lived there. My father's family was from what was then Austria-Hungary, but now I think it's part of western Ukraine. I have a younger brother and a younger sister. My father worked as a bookkeeper in the garment district. He managed to hold his job through the Depression, which was a terrible time. Just having a steady job was lucky. As for family, I guess I would say we were lower middle-class. We didn't do well enough to have a car or to live in a private house, but lived in apartments, which certainly was the style of New York at that time.

They couldn't afford to send me to a private university, so I started at City College in New York, which continued the ethnic education, I must say. After one semester there, I won a state scholarship which was good for going to Cornell. New York State has a special program where they give a competitive exam once a year and the winners get their tuition paid at Cornell. If they're further down the list, they don't get to Cornell, but they can use the tuition at any other college in New York State. So that determined where I was going to go to school, which was Cornell. I was an English major in those days, and I did graduate work afterwards at Penn State, where I wanted to get some teaching experience. I was a graduate instructor and also got a master's in English there.

The more I went on with English, the more I realized that it wasn't as interesting as I had thought. At the time I was drafted, I knew I wasn't

going to go on in English, but I didn't know what I would do. I did meet someone in the Army who told me about city management. As a field, it sounded interesting. When I got out, I looked that up and I discovered there was this other field—city planning—which sounded even more interesting. That's when I made my jump. It was soon afterwards that I came to MIT. I've been here ever since, except for an occasional leave.

When you came to MIT, had you already gotten your degrees at Cornell to become a professor?

No, I just had a bachelor's degree from Cornell and a master's from Penn State. If I had stayed in English and become a professor, which is probably what I would have done, I would have gotten a Ph.D. in English.

How did you connect at MIT? Was there anybody involved in suggesting that this might be a place that you should consider?

I discovered that there were publications by and about city planners and city planning, and in the journal of the professional association somebody had written a letter about the desirability of making more information available to young people who might want to go to school to study city planning. I figured he would be sympathetic and I wrote to him. He lived in Philadelphia and invited me to come to Philadelphia and meet with him. He briefed me a lot on schools to apply to, what the field was all about, and gave me the names of other people.

That was the start. I applied to several schools. I applied to three and got into them all. I was going to go to Harvard, based on Harvard's general reputation for excellence. I didn't know a thing about city planning there. Through a mutual friend, I met somebody who had started to study city planning at Harvard and had then transferred to MIT, and he told me how bad Harvard was in this field.

Do you recall the environment here and what your impressions were after a short period of time here, say within a year?

Well, the environment for me was really just what was in the Department of City and Regional Planning. I had almost no contact with the rest of MIT, except I did take economics courses. But I didn't know much about what was going on except in my own field. There was contact with

architecture also. Architecture and planning were in the same school, so students used to go out and eat together at the F&T and do things like that.

I had been in English for a while and became critical of the field. Early on I began to sense some real shortcomings of city planning. City planning, as it was taught then at MIT, was overwhelmingly planning for the suburbs, not planning for the cities. I felt that was not a great idea, and I decided that if I was ever in a position to affect the curriculum, then I would like to have more work focusing on the cities and problems of cities. The then department head, Frederick Adams, invited me to stay on and join the teaching staff after I got my master's degree. So I began to teach, and the first thing I did was suggest that in the big studio course which takes up about half of most students' time, instead of studying suburbs of Boston, why don't we study the cities?

I don't know what made me do this, but I wanted to do a project in Roxbury. It was really interesting. We brought in a couple of people from Roxbury to talk to the class and to the students. I think it was a revelation to everybody to learn more about how people were living in that part of the city. At that time, it was mixed—black and white, mostly black and Jewish.

What year was this?

I got my master's in '57, so this would have been about '58 or '59 that I was teaching my first classes. I think I should have mentioned also part of my own background. Being Jewish certainly made me aware that other minorities had also been persecuted. It got me interested in the problems of minorities, generally. I guess it gave me a predisposition to want to be helpful to anybody else who has been discriminated against.

I'm beginning to think that there is certainly a lot of correlation here among many of the faculty members whom I talk to who are Jewish and have had a sense about the whole issue of race relations—and an understanding of it, much more so than a non-Jewish person. I think that's a real justification to have in a way.

Well, it's like identifying with the underdog.

In your early years, though, what was the racial composition on campus in your department?

In my department in the year that I came in, there were no blacks or other non-whites in the class, but there had been a few blacks who came

through the program prior to that. During the first summer after I enrolled at MIT, actually through the same fellow who steered me away from Harvard, I met a classmate of his—Sam Cullers—who is black and who then had a master's degree from MIT and was working in Hartford. He sort of continued that pattern I seem to have had repeatedly of meeting black people and taking a liking to them. And I kept in touch with Sam over the years. He was a pretty bitter person at that time about the treatment of blacks in the U.S.—particularly where he grew up, which was around Chicago—but it was also clear that city planning was a good field for him to be in. In fact, he said he knew that himself. He used his city planning background to get a job in Canada at one point, where he found a refreshing lack of racism directed against blacks. He did interesting work and later went to California. For a time, he was director of planning for the state of California. After that, he went into a private consulting business.

I don't know if he was the first black, but he was certainly one of the first blacks to come through the program. The last time I saw him, which was just a couple of years ago, he really had a one-man consulting firm. I don't think he had a staff. He just did consulting on his own. At one time in the past I think he had been a member of an engineering firm.

In those early years, I started to teach before I entered the Ph.D. program. In fact, the Ph.D. program wasn't invented until after I got my master's degree. I was one of the first people into it. In those early years, though, when I was teaching—I kept teaching while I was working on the Ph.D.—there were a few other black students who came through the program. Reg Griffith was one. He's another person who would be excellent to interview. He's a very nice guy and he has had a very successful career. For a number of years he has been the director of the National Capital Planning Commission in Washington.

Another fairly early black student in the program was Phil Clay. I became his advisor. I don't remember exactly how that happened, but at any rate I took a great liking to him as soon as I met him. I had the urge to be helpful and felt I should help him in any way I could. I would consider it a good relationship over the years. I guess I had a mentoring relationship to him in the department. Essentially, I was his mentor. I'm certainly very

pleased with the career that he has had and that he has been as successful as he has been. I think he's a terrific person and MIT should hold onto him. When he got his Ph.D., I told him there was only one thing we expected of him and that was not to leave MIT for a while.

But the kind of mentoring that was helpful had to do with Phil's joining the faculty. We certainly felt that this person really had potential and, especially with a little help, that he could become a member of the faculty here. And he did. He was gone for a couple of years in the Vietnam War, but luckily he came back in good shape. As the time was approaching for tenure, I think it may have been the suggestion of Frank Jones, I took a good look at Phil's situation in the department to see if there might be any problems ahead. I felt that there possibly was a big problem ahead, in that Phil's field at that time was housing. The department was fairly small then and not likely to have more than one person in a given specialization. The department had already hired a very good recent graduate—Langley Keyes—in housing. I conveyed that to Phil and said, "I think you really ought to try to pick up another specialization, between now and when you come up for tenure." He was quick to act on that. He built up his own background and skills in demography so that when he came up for consideration for tenure, he wasn't just a second housing person—not someone like Langley Keyes—but someone with a distinct specialization of his own. I think that may have been the critical thing in his getting tenure.

During the '60s, we began to get more black students and I would say that they were of course almost all middle-class. We talked about trying hard to reach kids in the low-income communities, but that really didn't happen. Many of our students would try to give the impression that that's where they came from, but it really wasn't true. They had educated parents and went to good schools, but I think academically none of the first that we had were as good as Phil Clay. Nevertheless, they were good solid people who got their degrees and went into the field. I've kept up with them and most, I think, are doing quite well.

There have been a number of them whom I've met in different cities who are very appreciative, first of all, of their education in the department as well as the fact that

many of them actually are doing excellent work and have very good jobs playing pivotal roles where they are. I think that that says a lot about the department.

Yes, I think the department has been hospitable to them. In fact, this wasn't my doing in particular. I think most of the faculty felt that we should make an effort to get more minority students, and that when they did apply, we should bend over backward to give them every possible consideration and bend the standards a bit if necessary and then take them in. But there was a period of a couple of years where it was kind of ridiculous, when you couldn't tell from the application who was black and who wasn't. You couldn't ask for pictures. You certainly couldn't ask what an applicant's race was. We had one year when there was a marginal case and we didn't consider this person good enough to make the first cut of admission, but he was a graduate of Howard University and we figured he was probably black, so we admitted him. He turned out to be white.

Over the years, I guess as Great Society programs developed that dealt with cities, city planning became better known and I think blacks as well as whites heard about it more often. So we began to get more black applications. We also tried techniques of our own to get more applications. I don't know how successful we really were. At one point we were running a radio ad on a station that people in Roxbury listen to. I don't know whether anybody applied because of that.

Well, for at least the years that I can recall when I came to the Graduate School office in 1972, at that time when I looked at the records, the department always had the largest number of black and other minority students in the Institute and consistently did that for, I would say, probably the next ten years. I think there became an issue of funding in many cases, sort of a gradual cutting back, but basically the department has always had a large number of minority students.

Could you outline what you have liked best and least about MIT's efforts to increase the black presence on campus, faculty as well as students? What is your assessment of our recruitment and affirmative action efforts and policies during the last, say, two decades?

Well, I've observed, as you have, that the city planning department seemed to be the most active department by far. I think the MIT administration has encouraged departments to go out and recruit more blacks. But my sense is that in a lot of depart-

ments, the faculty probably don't care much about it. If they were more concerned about doing it, I think they would have done more. What they could have done, I really don't know.

One of the comments that has been made to me—in fact just today, and certainly in past interviews I've had, particularly with non-black faculty members—is that particularly in the sciences and engineering it's because of the limited pool that we have not been able to attract black faculty members and in some cases black students and other minority students.

I think faculty are another story, separate from the problem of identifying good minority students. I think in this respect also, I get the impression that city planning is creating statistics for all of MIT. We have had a series of black people on the faculty, most of whom, however, didn't stay very long for one reason or another. There was Bill Davis, for example. Everyone had his own story here. Bill was fine, a good teacher and a sharp lawyer, but he got an offer from a top law firm in Washington at probably something like triple his MIT salary, so what were we supposed to do? So Bill took off. We did have at one point Ted Landsmark, too. I don't know exactly what happened with Ted, but he stayed only a year or two. Mel King, of course, was recruited early. That was around 1970 or so that Mel King came in.

Hubie Jones, right?

Oh, yes. Hubie is another one who was here for a couple of years. Then Hubie got a much better offer to go to BU and become a dean. The department didn't make any serious effort to hold on to him when he had that kind of offer. In retrospect, they really should have.

The problem of recruiting minority faculty is that when the time is coming close for tenure decisions, in terms of their age and how many years they've been at MIT, we didn't see a tenure case there. So that meant we had this turnover that would mean recruiting people, but they were not joining the permanent faculty. In the case of Phil Clay, that was really a different strategy. We don't exactly know how to find black people with Ph.D.'s who are qualified for faculty positions. Here was a guy, however, who had the potential and we could sort of grow our own. That's what we did in Phil's case.

You also did that with Hassan Minor.

Hassan Minor, that's right. He was on the faculty for a couple of years also. But again, he followed that same pattern. I don't remember very specifically why he left, but he stayed only a couple of years.

Well, I think the one thing I can say about your department is that it seems to me that all of you try different strategies. Some of them didn't work completely, but there was at least an attempt to try some different kinds of ways of being able to bring black presence on the faculty. I think at one point you had something like four or five black faculty members, when Bill Davis and a number of the others were there. When I looked at how these people were there, how you brought them in, there were strategies almost by each one of them, and I wondered why another department could not do that with some chemist or some biologist. You weren't successful on all of them as far as them staying, but at least there was an attempt to make these efforts. I found that very encouraging in that sense.

Well, we certainly tried, and there were some ingenious people on the faculty. We calculated what some good strategies would be. In the case of Mel King, for example, to get him on board, there was no such thing at the time as an adjunct professor at MIT. Lloyd Rodwin got together with another department that had a similar situation to invent this and present it to the MIT faculty to get him in the door. That made it possible to bring in Mel King. That's the same thing—seeing an obstacle, but also figuring out a solution to get around that obstacle.

Exactly. I found that quite interesting. Even in the other area, the student area, which is a little different, I thought that there were creative ways there. Even the way that the department came to ask for money for the graduate students, they had a unique way of structuring things so that you had to at least say, "Well, hey, they want to try." That's what I thought was encouraging, and I think to this day you have many more supporters out in the society because you have put these people out there after they have been brought in and trained.

That's right. I didn't say anything about the finances, but of course we had to go and find fellowship money or scholarship money for these people, and we did. We were able in some cases to use federal programs that were intended specifically for minorities, or in other cases donors would step in. Fortunately for us, these programs were explicitly for recruiting minorities; otherwise, we

could get in trouble for reverse discrimination. So we did those things. I also would have to say that in some respects some people, if not the whole department, did pay a price for doing that.

We had, I think, two occasions where there were junior faculty members who were white who were much criticized by black students. The students felt that they were too demanding and maybe not effective at teaching what they tested students on, and in both cases their careers at MIT were halted by that; there were enough complaints. I think the fact is that probably in both cases these were pretty demanding people, but they were equally demanding of whites and blacks. But the black students mobilized and raised their complaints and made life very difficult for these junior faculty members, and I think soured the rest of the department a bit on trying to help them build a case for tenure. So they both left.

That brings up another question. Consider the role played by senior mentors and role models in career development for newcomers of all races. What can you say about that?

I think it's very important. In fact, you asked me my impression of MIT and its efforts generally. Well, this is a general problem at MIT, that there is not good mentoring. There is not good mentoring in my own department. Recently, some rather unfortunate situations came to light where it appeared that senior faculty were taking advantage of junior faculty in unfair ways. Just last year, the department set up a faculty committee on junior faculty that they asked me to chair. It was really for the purpose of protecting them and mentoring them, giving them an accurate sense of what it was they had to do at MIT, and listening to their problems and trying to help them find solutions to their problems. I think this place is not particularly good at that. It's a very demanding atmosphere to be in. I think most departments are not giving a lot of attention to helping junior faculty to survive.

What are some of the things you think are key in terms of senior mentoring, helping younger faculty members?

I think mostly listening to their problems and trying to help them deal with them. They each have somewhat different problems. It's not a consistent thing. Some, for example, might need certain kinds of data to pursue the research that they need to do and they don't find a place at MIT that collects it or processes it where they could get it. There are

other universities that have survey research centers, let's say, so we try to work around that, put them in touch with UMass-Boston, which has a survey research center where they can get some of the materials they lack. Others, I think, come in and don't have an accurate sense of what standards they're expected to meet. You have to break the news to them about what the standards are. They're not happy to hear it, but they appreciate the fact that we are leveling with them about what they're going to have to do to stay.

I want to make it more personal, because I know that you have played a major role in the life of a number of young faculty members. How much more specific can you be in terms of what you have tried to do to help young junior faculty members to survive? I know in the past that many of them have come to you and probably still do. You have a sense of it. You are probably one of the giants in that area, in my opinion.

Thank you.

I'm really interested in pushing you a little bit to talk about what you look for and what you try to do. It obviously is very good, because it works.

Well, I'm not sure that I know. Most of what I can think of is that I give them a sense of what's expected of them and help them to do those things, and particularly with publication. Maybe there I did have more interest and skill than others in writing, researching, and making the research presentable to other people. So the sort of thing I've done is to try to discover what their research interests are.

First of all, if I don't know anything about the field that they're working in—which happens from time to time—I put them in touch with people who do, but then monitor the situation, seeing that they're okay. “Are you getting help from these other people? Are they including you in the research projects that they're doing in this field that you're interested in? Can you get on board with them? Do you need help with fundraising?” I try to get them that help and offer to make life easier for them—“Look, I will be glad to read your proposal and make suggestions about it. If you're working on a book, I'll be glad to read the manuscript.” I try to help them in very specific ways, product-oriented.

Well, that's very helpful. Is there any advice that you would offer to a young black faculty member coming into

MIT as it stands today—coming into the department or coming into MIT, because you've seen the broader picture as well?

I would give the kind of advice I've given to people in my own department, which is—don't be provincial, get around the place, don't just stay within the department. It's a very rich place and you'll find very interesting people in other departments whom you might work with, or they'll appreciate your work and you'll appreciate theirs. So get out and around, and don't make too many commitments, but serve on a couple of faculty committees so you will meet other people from other parts of the Institute.

I would certainly suggest that. Otherwise, it's partly mapping out a careful plan for the use of your own time. Do your best to help people. Make sure that they get a six-month leave, say, when they're at the stage where they've got to produce something significant in order to get the next promotion, when they're coming up for tenure. But it's tough to do all the things you have to do at MIT and still find time to do your research, at least around my department. So you try to get around that by having your department give you the time off.

Sometimes I'll argue with senior faculty that the load they put on junior faculty is too heavy. We discovered that one junior faculty member was being asked to handle all MCP admissions. That's a big job and that's really unfair to him. If he puts the time into that, then I think he's not putting his time into his teaching or his research. So it's partly protecting people against that, in a way. I don't know that I can say more.

Well, that's a lot. Is there any other topic or issue or incident that comes to mind as you reflect on your own experience as it possibly relates to the experience of blacks at MIT?

There is one other thing I should say about the efforts of the city planning department to recruit minority students and faculty. I think over and above just feeling that this is the right thing to do, there's also a feeling that it's important to the profession, that most of the urban problems have to do with blacks in cities. It's important, therefore, to have blacks well represented in the profession who can work on these problems and can also give the profession the credibility it needs to deal with that. That, I suspect, is something special to us. There are no special needs relating to blacks in chemistry.

Also, I think maybe there's not a sufficient appreciation of the fact that even in the teaching setting, there's a lot of two-way learning that takes place. It isn't all the professors speaking and the students absorbing things. As I began to have more black students in my classes, particularly in the '60s, it was a very healthy thing, because I and the other whites in the class were getting a valuable perspective from people.

Maybe I should mention some other things that I was doing outside of MIT. I had a chance to work on some of the Great Society programs. I was on the White House task force when HUD was created. I was on the staff of the task force. Part of the assignment from Lyndon Johnson was not only to design an organization which would become the next Cabinet department, but also to suggest what programs it should have. I worked very hard on what became the Model Cities program, drafting legislation for it and figuring out what that would cost and how to package it so that Congress would conceivably pass it. After this, I did a critical book evaluating the results.

For people who worked on the formulation of the program like me, the results were very disappointing, because essentially it got lost in the Washington bureaucracy and other agencies didn't cooperate with HUD. The program made so many promises and achieved so little, when you looked at the results. I presented it that way in one of my classes and one black woman in the class said, "Well, that may be, but I got my first job through the Model Cities program." That led to a very useful conversation. It got me really thinking about things.

I think one of the things you have mentioned is the role that you played not only inside the Institute, but also outside of the Institute. During the period when we had the riots in 1967, again, the whole idea of the Great Society came up that Lyndon Johnson responded to, I guess, after the task force or the commission that produced the Kerner Report went in and looked at some of the causes of the problems, the riots in the cities. You were talking a little bit about that.

Yes. I mentioned earlier that I tended to become critical of the city planning profession after I had gone through the master's program. I really started out in my teaching and writing career in that frame of mind because I, and also the Kerner Commission, felt that some of the urban programs

of city planners had been contributors to the atmosphere that led to the riots. Typically, the urban highway program and urban renewal both displaced large numbers of poor, minority people—particularly blacks—and did next to nothing for them, and naturally enough were a big irritant in their lives. When the Kerner Commission did their surveys and tried to find out what reasons people gave for having participated in the riots, I think the number one complaint was about the police, but these urban programs weren't too far behind. They were maybe about the third level. There was urban renewal, also known then as "Negro removal."

I felt that the first thing to do was to reverse those programs and certainly not to create another program like that. Much of my work on the Model Cities program was on how to prevent it from following the path of urban renewal. It had been taken over by people who didn't mind displacing anybody who got in their way. The early teaching that I did was mostly on social policy issues like relocation and how relocation could be done in a humane way. How could urban renewal be done in a more humane way? That was both my intellectual interest and my moral commitment at the time.

That is a very important period, and I think it was a very frightening period for a lot of people in America. I think people really didn't know what to do about it and probably had ignored the problem for a long time.

Yes. My feeling was that if urban development couldn't do what was right, at least it could stop doing things that were wrong.

I think there are some things here that will tie in very much with what we're trying to put together, and that you could be very helpful, particularly in terms of a department that—probably more so than any other department—has tried to do some things within the framework of its mission. I've felt that way for some time, and I know that you have played a major role in that. I might add, too, that I have talked to at least three blacks who have come through that department, and all of them have mentioned you as a very influential person.

I'm glad to hear that.

So I don't come to you without having some sense of the commitment that you have made over the years.

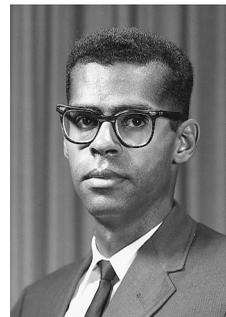

Well, maybe I could put MIT in a broader context. There were some interesting things. When I

was chair of the faculty and I sat on the Academic Council, Shirley McBay was there, and I got to know Shirley fairly well. At that time, and maybe it's to this day, there was an informal exchange every year or two where MIT faculty and administrators would go to Caltech and at alternate times Caltech people would come here. Well, Caltech came once concerned about the lack of diversity in their own student body and their own faculty, and they had been shown much better figures at MIT. They came and wanted to find out more about it. They investigated, and as they looked department by department, I was there when someone—maybe the president of Caltech or one of the senior people there—said, “Now that we’ve looked department by department, it seems to us that the departments in which you have all your black students and faculty are not the departments that you have in common with us. In the science and engineering departments, you don’t have them, either.”

Shirley said she was at one of those meetings when MIT went out to Caltech. They were sitting around in a conference room and it became clear that there were very few black students at Caltech. The faculty was concerned about it and the administration was concerned about it. Shirley finally said, “Well, exactly how many black students do you have?” At that point, a black fellow went by on a bicycle outside the window and one of the people in the room said, “That’s him.”

WILLARD R. JOHNSON

b. 1935, AA 1955 Pasadena City College, BA 1957 (international relations) University of California at Los Angeles, MA 1961 (African studies) Johns Hopkins University, PhD 1965 (political science) Harvard University; joined the MIT faculty in 1964; professor of political science, 1974–1996; emeritus, 1996; director, Business Management for Economic Development Project, Center for International Studies, MIT; executive director, Circle Inc., and New England Community Development Corp., 1968–1970; chair, board of directors, 1970–1973; member, board of directors, TransAfrica and TransAfrica Forum, 1977– ; founder and president, Boston chapter, 1980–1985, 1989.

I'm sure I was moved to a more intellectually oriented or academic career by the fact that my father was a university graduate and was thought of, within the family circle, as very smart. That was the thing that distinguished him. Being like him meant being very smart, or trying to be. He also had had the experience of being first of his race in an important position, when he became the first black professional at Jefferson Barracks Hospital, which produced some newspaper articles that were impressive—to me, anyway, looking back. He was in an allied medical field. A bacteriologist, he owned and operated a medical laboratory. The pressure on me was always to go into medicine. He had wanted to be a physician and my thought had always been that he hadn't been able to afford to be one. Years later, I found there may also have been other blockages along the way, like lack of encouragement.

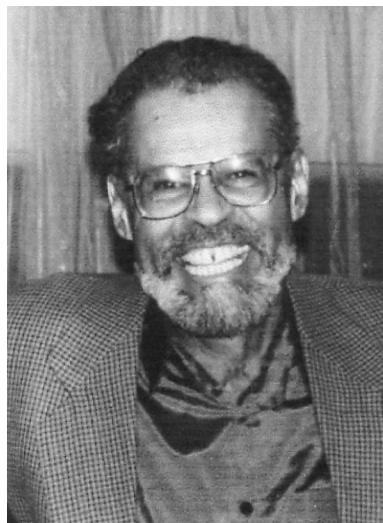

Anyway, the point was that he had not been able to become a physician. We never had an explicit discussion about it, but I always sensed that somehow or another I should do that. But early on, I really lost any real interest in medicine. I used to work with him in the medical laboratory, so I had an exposure to it. Organic chemistry didn't help.

You didn't particularly excel?

No, and I was told by a guidance counselor—who happened to be also my organic chemistry teacher—that I was not likely to get into the best medical schools with a poor performance in organic. One of the things that I, looking back,

learned about myself was that chemistry, particularly, seemed to call for memorizing details and being able to hold on to the formula—to know what was going to happen with this compound and that one, specifically. I've never been great about that. I've been great on concepts. I know if one thing is relevant to another, but really remembering in detail lots of facts was not my forte.

So I got off that track and into social, politically-oriented studies. The idea that I would be in a career using my head, that was almost a given. My father, I think, favored me for that. My brother was distinctly not intellectually inclined, so that made it both better and worse, so to speak. My father would focus on me and ignore my brother. I was ambivalent about that, but I don't know that that ambivalence really is relevant one way or the other in my subsequent career.

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with Willard R. Johnson in Cambridge, Massachusetts, 20 February 1996.

I remember, for example, that in junior high school I took a philosophy course... No, I guess it was senior high school. I had gone to a high school that was combined with a junior college. It was an experimental thing. I was able to take college courses while I was still in high school. This may have been a college-level philosophy course, which was the most demanding concept-oriented of the courses I had had. I did very well in it. I remember the professor making some remark that made me realize that he thought I was academically oriented, that is to say, that I was going to wind up being a professor of some sort. I didn't realize it at the time, but that must have influenced me. There are little cues along the way that give you some sense that this is an appropriate thing to seek after, that you can do it, that you have the confidence, that things are going to work out. In my church and in a lot of other ways, I tended to be singled out, so I always had this sense that there was some higher expectation of me. In some places or communities in the South, they would say, "I think he's the one."

So they push you forward. All of that seems positive to me, looking back, although in many ways I wasn't aware really how important those things are.

At this point you were in St. Louis?

No, I didn't spend much time in St. Louis. I was born in St. Louis and my father had gone into the U.S. Health Service there. I found out some years later that that was because my mother and grandmother had written Eleanor Roosevelt, who actually took account of the letter and did something about it. He had taken the Health Service exam and had placed very high, if not the highest, and then didn't get the job. He had a master's from the University of Chicago in the mid-1920s, although that wasn't the degree he wanted. As I already mentioned, he had wanted to go to medical school. But anyway, the point is that the White House intervened and got him into the U.S. Health Service.

Then, of course, the institution itself took over. He was initially in Jefferson Barracks Hospital in St. Louis, which was an all-white veterans' hospital. The white officials there conspired to get him forcibly reassigned to the black veterans' hospital, which was in Tuskegee, Alabama. That's how we wound up in Tuskegee.

I grew up in Tuskegee, a little segregated town, but it was an academically oriented place with three different bases for a middle class among black folk. You've got the Air Force, the hospital, and Tuskegee Institute. So the notion, again, of all the levels of society being demonstrated to you, was important. But there were also distinctive things about it—first, exposure to a black middle class and an upper class. Looking back on it, I did have a kind of sense of anointment, some might say, but the positive side of it would be just being blessed in ways that you don't appreciate.

I remember my father telling me about this great man George Washington Carver and taking me down to the Institute to his laboratory and pointing him out. It just created an aura around this man. Carver had a little playhouse outside of his laboratory—a model, miniature house that children could play in. He was a very shy person, it seemed. He liked children. He didn't like to interact with them, but he liked to watch them. He would watch us playing from his laboratory. I remember seeing him. Then he died, and at school there was this big hoopla about this great man who had died—that made the connection back with my father's comments—so we filed past the body. I think that's the first dead man I saw, so that's also a deep impression. But with all the discussion about him and my father's discussion about him, I decided on my own to go to his funeral—me in my little raggedy, unpresed clothes, you know. I got to his funeral a little bit late, a harbinger.

That's a memory, that's a connection. I have some sense of "there are such people in this world," I've had some chance to connect with them, and in my own little way I try to make good on this. Tuskegee was a very important kind of anchor for me. I really liked my time there because I was very young, it was rural, semi-rural, et cetera. But my family hated it. They had come from the Midwest. They had come from non- or semi-segregated communities—officially non-segregated; socially, in fact, it was segregated in Kansas. My parents were pushing against the system all the time. They did not have the attitude of being beaten down within that framework. They were going to get out of Alabama as soon as they could. We moved to California, which was different.

How do you get from Tuskegee to UCLA?

Well, with a banjo on my knee. The family migrated to Pasadena and I went to high school in Pasadena. The California educational system, you can't beat it. You do well in high school and you've got admission to university and it's free. Even then, for out-of-state people—we weren't out-of-state, we were in-state—tuition was minimal, and for in-state you just had administrative fees. We had something like student fees, seventy dollars a year. And it's first-rate.

So I don't think there was ever much discussion in my family about where I would go to college. I vaguely might have thought about Berkeley, but I didn't know much about it. The point was that UCLA was certainly the closest of the campuses. Santa Barbara was also in existence at that time. You didn't hear much about Davis and Irvine and other places like that. UCLA, Santa Barbara, and Berkeley required that you have an A average in high school to go there. So those were elitist—free, but you couldn't get in without the grades. You could go to the state schools, you know, but that was lower on the ladder. But if you were doing well, the fact that they only took the top also made them look better.

I in fact did not go immediately to UCLA. I went to junior college because I would have had to live on campus at UCLA and the expense of that was too much. I never even considered doing otherwise. I mean, the fact was that I could go to this same high school which was integrated with junior college and it was about six blocks from my house. The first year and a half of college I spent at that local high school/junior college. It was a combination of both. I just continued through.

Then I transferred to UCLA. Pasadena was the only high school system or junior college system, I should say, in the state—I think I'm right, at least we kept saying this—where transfers did not get into difficulty academically when they transferred into the University of California system. In other words, it was good enough so that the tendency was that if you were doing alright at Pasadena City College and you transferred to UCLA, you continued to do alright. The truth of the matter is that there was a night and day difference between the two. I breezed through Pasadena and I got to UCLA and—Whoa! But I did okay. By then I was very politically oriented, so I was active in student politics.

Talk a little bit about that, because that's very unusual, particularly during the 1950s.

I did brilliantly in high school. Part of the reason was that when I was in Tuskegee at the segregated "Children's House"—that was the name of our school—I flunked the third grade. The teachers were worried about me because I was bumbling along at the bottom of my class. But when I got to Pasadena and I found that I had already studied the material they were getting to—we had already been through it in Tuskegee—I suddenly knew it and I was then best in the class. That was such a good experience, I didn't want to give it up. It was as if I said to myself, "You've got a head start now, stay out there."

So I did very well. For example, when I took plane geometry, I think it was, I just knew it, it was almost instinctual. I had no problem with it whatsoever. One day the teacher was sick and the substitute didn't show up and the students started goofing off and I got upset and said, "Look, why don't we just go ahead and do the lessons?" So then I taught the class. Somehow or another they let me do it. I mean, we just went on through. The principal evidently came down to see what was going on, and folks were doing their homework on the board and so forth and I was saying whether this was good and that was bad. Then I got called in, "this was great," and so forth and so on. Now I was puffed up a little bit.

Then we came to the end of the term and the awards ceremony. I got all the normal commendations for an "A student." However, I didn't get any special commendations and I saw these other students who were worse students and they got this award and they got that award. And I thought, "Damn, what's going on now?" I wouldn't have thought that it mattered so much, but I guess because of all this other kind of framework I had, such as in the church—I'm superintendent of the Sunday School, I take the initiative, I guess I was a take-charge kind of person—I just assumed that I was going to get this award. I don't remember if I talked to somebody or not, but I was very reflective on it. I said, "Well, what is it?" It did not occur to me that race was the number one factor. Some awards went to football players and basketball players, but I'm a little dense in that regard. So I assumed that the problem was that I was just a one-track guy,

I just had the academics. So I said to myself, “You should do some of this other stuff.”

When I got over to the high school, first thing they did in the orientation session was talk about what awards they have. You could get an award for best student and one for best-rounded person. Best-rounded person was for a combination of academics and leadership and so forth. I decided, “That’s going to be the one I get.” I worked back from that goal. Then I decided I would run for class president. And I did and I won. Subsequently, I held other offices. But it was kind of calculated.

So this was actually sort of preset in your mind that you were going after these things.

Well, that one, because I had been so offended by the elementary and the junior high school business. Really, I would say it hurt. I was aware that I was hurt by it, so it was calculated from that point of view.

But then another really profound influence for me was the Pasadena Boys’ Club, which really had an unusual leadership program. The one in Pasadena was one of the leading clubs in the country and one of the most progressive, I subsequently discovered. Tommy Thompson, who was the director of that club, had insisted that it have absolutely the finest everything. They acquired a location that was right at the borderline between the black part of town and the white part of town. The town was not strictly segregated, but blacks did tend to be concentrated in the northwest part of the city. I didn’t know at the time that there had been any real discussion about placing it there. He had to fight for that because the whites were not happy. In the end—I mean, long after—they in fact reversed that and moved the principal location to the heart of the white section, with an ancillary facility in the black section.

They had a woodworking and a metalworking shop. The director of it was a guy named Bob Morgan and he was helped by his wife Lucille. He had been an engineer with some big firm, really didn’t like it, and decided what he’d love to do was work with youth. He came to this club. He was first-rate and he just took me under his wing along with a number of others. I learned to do so many things there, not the least of which was to have a goal and develop a project.

I remember my very first week in Pasadena with my cousin Quincy Jacobs. We went to the Boys’ Club and I saw, as you came into the lobby of the building—it was the location previous to where this fine facility I just talked about was located—this glass case with this huge model of a ship, like they have over in Building 5 at MIT. It was really intricate. It had all of the ropes, sails, and the whole bit. I looked at this thing, and it’s the first time I had really ever seen a model so intricately done. And for some reason I decided I was going to make one just like it. So I set out to do this. Now, that was probably the only project in my experience with Boys’ Club I never finished. It was the first one. I set out to do the most complicated task, but I guess just the effort to try to conceptualize it was good. I would see it there, then I would draw it out, then I would make a plan of it.

Morgan kind of nurtured me along. Over the years, he was really like a second father. I would spend so much of my time at the Boys’ Club. The whole process of having a goal, working on it, planning it out, executing it, taking it to fruition—a lot of this stuff I made wound up on display there, so I always got accolades.

Was Morgan black?

No, he was white, but he was great. Then he also started a leadership club, just to help young people understand and relate to each other and learn to take leadership and so forth. I was in that. Then he made sure that I went to camp. I went first as a camper. I was tall, I was mature, I was a “take-charge” kind of fellow. I went to the camp maybe one year as a camper, and then the next year they asked me to come as a counselor. Now I’m counselor over other kids who are really my age. Just because I’m so much taller and bigger than they are, they didn’t know. But it was good training. It was training in how to be a leader in a natural kind of framework. I did that. I was counselor for a couple of years and I was head counselor for a couple of years.

How old were you when you were a counselor?

Well, when I first was counselor, I was probably thirteen. I was head counselor by fifteen. I did it until I was about eighteen. It was a very good kind of framework for social development and confidence building, even the crafts part of it. You have a project, you see it through. All of mine tended to

be grandiose projects, but I finished all of the rest of them besides that boat. I entered the Fisher Body Craftsman's Guild and I worked on that model car for a year, but I didn't win anything.

So those were influences that really were grounding. I can't remember any discussion with Bob Morgan about career. There must have been something, but certainly the expectation of being in leadership, you're almost nurtured in that and you learned to keep pushing yourself to do a little bit better. Then my cousin Quincy, with whom I was very, very close, also had his own set of aspirations. He really wanted to be a pilot and an engineer in aeronautics. But he died in our youth from Hodgkin's Disease. We never thought about sports as an outlet, we never thought about anything frivolous as an outlet, and all of that sort of reinforced my prior character.

So when I finally get into the high school and I decide I'm going to go and be class president and so forth, then I start into a process of leadership that is reinforced by the Boys' Club. The Boys' Club also nominates me to go to Boys' State, an American Legion project they have state by state, sort of a model state government. I go to Boys' State, learn a bit about state government, and so forth. It's politically oriented, so I run for office. I become "lieutenant governor of the state of California." By the way, one of the nice experiences from that is that you actually work with the real lieutenant governor for a day. One of the things the lieutenant governor had to do in that particular period was handle transfers of state funds. So I wound up with \$465 million in my hands.

That was a great experience. Then the Boys' Club also got me involved in a region-wide kind of student council called the San Gabriel Valley Youth Council, which was just being organized. So we came in on the ground floor. We got called together and were asked, "Wouldn't it be a good idea to have youth coming from various parts of the area in southern California?" I wound up the president of it and largely a designer of it.

But all of that is leading me in a direction towards public affairs, issues of policy, things of this sort. It's just kind of a natural evolution then, as I back away from the medical orientation, that public affairs and government emerge. Now the international part of it comes in essentially by the experience of going to a model UN. This is pretty

much in the same period. I had already had the Boys' State experience and now you have the model UN and it puts an international flavor to the scene, a sort of modeling process. It was great fun. So I'm really sort of international affairs-oriented by the time I transfer from this junior college to UCLA.

Now, UCLA itself, it's a mind-boggling experience—academically, I mean, I had to start over. Politically, I had no notion of what had been going on. The University of California system had been in turmoil around anti-communism in the McCarthyite period. There had been a lot of activity on campus that I hadn't heard about. When I got there, things were in a shambles, so to speak. They had shut down student government because the dean of students had orchestrated the impeachment of the student body president and a whole bunch of stuff. They closed the student newspaper.

Now, in the midst of all of this, I fall in with some guys who talked about starting a chapter of the NAACP, a youth chapter, especially when we find out there are no dormitories. You had a cooperative house for women and a much larger cooperative dorm kind of house that men lived in, maybe two hundred students. Other than that, you had fraternities and sororities, all of which were racially exclusive. So, as a black person coming on the campus, if you couldn't get into the cooperative housing, you probably couldn't live on campus. That was part of our issue—the exclusionary process within the fraternities and sororities, and yet they had been sort of licensed by the university and had this special affiliation.

So we organized around that. But unbeknownst to me, that was only part of the general picture of agitation on campus around issues of social change. All of this is happening in the context of a world changing. So I step into this and probably some guys see me come in and I'm ready, so they say, "Okay, you should be publicity secretary." They were trying to figure out, "Okay, let's make a statement to the press." They were going round and round, so I sat down and wrote out the complete statement while they were still discussing. I said, "What about this?" "Oh, that's good, okay." So I become publicity secretary for the chapter. Well, one thing leads to another and we get stomped on by the university. Everybody else connected with this is just disgusted, saying,

“This is ridiculous, absolutely, to suppress a chapter of the NAACP.” There were charges that we were communist agitators—the NAACP! It was incredible.

It was in connection with the effort to resist the suppression of the NAACP youth chapter that I first met Vivian. I went to her because she was on the student council. I tried to get her to back our efforts, and she was sort of reticent—not about the issue, but the manner in which I approached her. I came into her office saying something like, “Now what you should do is...” Her response was essentially, “Say what?”

“Who do you think you are?”

Exactly. Anyway, the long and short of all of that is, after a whole lot of permutations of it and so forth, lots of ins and outs, I decided I’m going to run for student body president. I ran on a whole stack of issues connected with this sort of thing, recognizing that student life is part of real life, and these issues of social change in the society and in the world are relevant to us and we’re being suppressed essentially for bringing those kinds of concerns onto the campus. The accusation is, “You wouldn’t do that if you weren’t communist. You’re just an agitator, you’re being used by these larger forces.” It’s right here in front of us. So I wind up being student body president.

It took nerve to do that.

Well, it took foolishness in a certain sense. I didn’t really sit back and think about what the consequences were, what the dangers were. All of these experiences had naturally led me to see what you can do. I’m saying to myself, “Of course you can do it.” Not just me, I mean, “This can be done—this ought to be done, this isn’t right—if we just organize this way, we can do something about it,” then we do it. You would naturally come to that. So in a certain sense, the blessing in all of it is the lack of self-censorship. If you hadn’t had all that and it was much more kind of calculated caution, you might not try. I see all that as very positive, but kind of a natural lock-step thing. It’s almost as if it would have taken a different kind of person not to do those things.

I want to hear a little bit more about Vivian, because I did not realize that you had met, as you said, earlier.

I should be technically correct. I actually first met her—was introduced to her on the campus—walk-

ing across the campus and being told she was the women’s rep on the student council and being impressed with that. Then once we got into all this turmoil, I naturally would go to her—as a black person, because it’s not a women’s rep issue to raise that. That wasn’t the best foot forward. But once I ran for student body president and won, things changed. I mean, the campus was in turmoil and that emerges out of all of that as something of an answer. Somebody would say that’s pretty arrogant. I actually had a little campaign slogan, saying “Answer with an ideal.” Well, that’s a clever double entendre. “You’re saying you are the ideal candidate?” “Well, yes, and I also have an ideal about this.” It’s an idealistic campaign, in other words.

Anyway, Vivian interacted with the campaign. But then, at about that time, several things were happening in the world, one of which was the Bandung Conference in Indonesia among the ex-colonial states. I decided that we should have a get-together among the students on campus who represented that emerging ex-colonial world. A lot of them were concentrated in my cooperative housing unit because they also couldn’t get into the fraternities and sororities. So it was a cauldron, so to speak, of the international students, which was a blessing. We had this student Bandung conference on campus, which I organized. It turns out that Vivian helped me do that. We organized various functions to pull the resources together. I’m student body president-elect, I’m not yet really in office. She’s still in office and she’s using some of her student council connections and so forth, and we pulled it off. In the course of working together on that, I guess she got a better idea of me. And she was impressive to me from the start, in every way. We got engaged in my senior year and we got married a few months later.

When you mention UCLA, what other things strike you when you move from UCLA to your next stage in life? Basically, do you recall how many student body presidents had been black before you?

One.

Was that Rayford Johnson?

No, Rayford came after me. First there was Sherrill Luke, who subsequently became city manager for the city of Richmond, California. We knew him only by reputation. He was a legend. He had gone on into serious government life, but he never had any image of being a rabble-rouser or anything of

that sort. He was just a black who had done this sort of thing.

Truthfully, I'm sure that there was a certain element of the race factor—positive probably—in my candidacy, but in the context of all that had been happening, there were two things that made it distinctive. One was that we put forward a kind of real-world platform and I ran a really active campaign. First of all, I decided we would have a whole slate of people working as a group. We had a platform for that group, so we were among the first student government candidates to run as a political party. That was the serious part. But the platform included the objective of reorganizing the structure of student government. That's the "Play-Doh" aspect of it.

I'd just come out of two similar experiences. There was this youth council thing where the focus was to "write a constitution." Then my high school itself had been reorganized and the two junior colleges in our city had been merged. There were two junior colleges in town which merged together, and I was on the committee to work out certain constitutional features of that. So as the student body president-elect at UCLA, I also focused on constitutional aspects of it, which was really kind of ridiculous, but behind all of that we did have a larger conception of student government. My notion was that we ought to be fully involved in the governance of the university—that is to say, in the educational mission of the university. Students are in society and all of the issues of society are a part of their life. Students are responsible and should share the responsibility for their education.

So in order to get around the social and therefore the fraternity/sorority orientation of student government, I said that our representatives ought to come to student council from an academic framework. Therefore, we ought not have a representative for the fraternities, sororities, and the men and the women, but rather they should be elected from constituencies based on the School of Engineering, School of Social Science, so forth and so on.

Part of the Institute?

Well, in the sense that they would be academically oriented and they would bring therefore their interest from that perspective into student council life and that might also emphasize the more real-world, the non-social aspects. Student government typically was social.

So this campaign kind of made people think a little bit. In the context of four or five years of turmoil on campus around issues of public policy, this all had started because students on campus—mostly radical Jewish elements—had refused to go into the ROTC. ROTC was a requirement. In the ROTC you were required to wear a uniform and carry a gun. And they refused to do that. They said, "First of all, we shouldn't even be required to be in ROTC, but if we're in ROTC, we should not be required to carry a gun." So that's how it started and within three or four years, it led to total suppression of all student government.

Tough issues.

Yes, they were big issues. They were even bigger at Berkeley, but we didn't know that. So in that context, you could say that these little steps that we were involved in led to bigger issues in ways that I couldn't perceive. That didn't stop me from naturally going ahead, but it did undermine my grade-point average.

Did the work itself in your student government have a lot to do with it?

Oh, yes. I spent a lot of time on this stuff. My grades were like B's, B+'s. They could have been A's if that's all I did. But that never would have been all I did.

That's never been your forte, based on what you've said so far.

That's right.

This is around 1957. What happened to you and Vivian after 1957?

Well, the first thing I did as student body president was to go to the U.S. National Student Association conference. At those conferences, I found out about an international student seminar that USNSA used to run at Harvard. So I applied for and went to that seminar. In the course of that seminar, little did I know, all of the entourage at the time looked me over. I emerged as their top person in the seminar. So the leadership of the organization asked me to run for office. The seminar was also a recruitment and training for the officers of the organization. So I ran for office and I got elected to be educational vice president. Then I was able to concoct a national program built around the things we had tried to do at UCLA. We called it the "student responsibility in higher education project." I applied for and got

money from Ford Foundation to do this, and did it for a year. Halfway through that year, Vivian and I got married and settled in Philadelphia, which is where our headquarters were.

I did that for a year and it came off fine. In this seminar, one of the issues had been how should the U.S. relate to the international peace festivals that used to be held that were sponsored by the Soviets, essentially. It was the Soviets' recruiting mechanism to get connections with youth organizations around the world. I had written this little memorandum, just as an exercise in the seminar, about how one could approach this. Little did I know that I had reinvented the wheel, so to speak. They were already thinking how to create this little information service and try to get people to go on the U.S. delegation, but then have their own really knowledgeable people in this delegation. It turns out that all of that stuff was CIA-funded and so forth. They recruited Gloria Steinem to run it. They actually did that, while I'm doing this stuff in Philadelphia, the educational stuff. It looks like my memorandum is being implemented, but it wasn't really based on my memorandum.

That then led to the issue of my taking an interest in the international side of it. Then various problems that I didn't know about within the organization posed the dangers of a maverick emerging in the international vice-presidency, and they thought it was going to be a disaster. One candidate was a good friend, actually, but they thought, "This guy, if he wound up being elected, it would be terrible," so I should run. I could sort of see what they had in mind: he just would have been a bumbling figure politically. That's why I thought I needed to run.

That got me on the international circuit, so I did a second year. But what I really wanted to do was go to the Johns Hopkins School of International Studies. I had been admitted, but I had postponed it for a year. That's when I first came to Cambridge. I found out a whole bunch of other things. Then I went through a tumultuous year, did my stint. My contribution with respect to the deep structure of all that was to say, "Oh man, this country is in serious trouble. So many of its institutions are supported in ways that people don't know." So I insisted that we consolidate our offices. The international office had been up here in Cambridge and the national office was back in

Philadelphia. That allowed for easier external manipulation. I'm set to bring the international office back to Philadelphia. Various and sundry pressures were put on me not to do this, but it fell short of a full revelation of all that this would really mean. A few years later this led to public revelation of CIA backing for nearly all of American international programs. But, I could sense the need for this consolidation to buffer if not break this external manipulation. So I did it, but then I wanted no more to do with this organization. I took my fellowship, went to Johns Hopkins, and did my studies in African affairs.

That also had altered my idea of going into government service. I initially had been oriented to the foreign service, but there was the combination of the NSA experience and then the School of Advanced International Studies in Washington. The school used a lot of government people as adjunct teachers and you got an exposure to the way in which things work in the government—the subordination, the hierarchy, the years of mid-level bureaucratic stuff before you have any real chance to work on policy. All that made me decide there that it was an academic career and not a government career that I wanted. I've already gone through a certain amount of being elected to things and being in the company of people who were elected to things and being among leaders and shakers, so I'm really not mesmerized by that. This is good. It made me see academia as a more natural world.

What caused you to focus on Africa?

That's because of my mentor at UCLA. It was a very pregnant time. Think back, the 1950s. I'm very opened up by the emergence of Ghana, the Bandung conferences, as I mentioned. They were really electrifying experiences for me. It was the colored world taking charge, you know. There was Nasser. That kind of focused all the attention on this new world emerging over the old world. Now, it doesn't take any genius at all to see that that's all of a piece, and that this country is going to change. It's got to change; the world is changing. And those events are all resources, so you get with those resources, and I could see that Africa, or at least the third world—let's say the ex-colonial, the decolonized world, really, is what it was—is attractive because of that.

Now, within that, what I found appealing was the Middle East—Nasser. Then I had classmates

and housemates who were Muslim and from that world. I take up Arabic studies and I do Middle Eastern studies as well. But you know, as I would talk with my professor, James Coleman, who was an Africanist, he would say, "Well, why aren't you interested in Africa?" I said, "Well, I am." And then he sort of got the notion, I think, "You're really coming at this through the back door, so to speak. You're really interested in black Africa, but somehow or another you don't want to just get ahold of black Africa." So we talked about that a little bit, a kind of revelation that I really did have these kinds of deep barriers, so to speak, to grasping Africa. I knew it was critically important that the decolonizing process happen in the U.S., that we come to see the black and Africa part of that as positive and everything was happening to make it so. Seize on that, push that, and that would be our kind of crowbar within the American political system.

You mentioned James Coleman. Is that the James Coleman?

Well, there were two James Colemans. It's the James Coleman in the field of African studies, but there was also a sociologist James Coleman, who was very, very well known. That's probably the one you're thinking of. He did a lot of educational studies.

It was Coleman who really shows me, first demonstrating in his own life and then by saying, "You can make a satisfying career out of African studies, you can do it." He really orients me by the time I go to the School of Advanced International Studies.

What's remarkable up to this point is the amount of experiences you're bringing up.

Well, that's why I say really the remarkable thing would be not to do these things. In a certain sense, I moved along, I'm going with the flow, I'm a little bit more attuned to historical things, but not really consciously, you know what I'm saying? It's not that I'm sitting down as a philosopher or an analyst or something of this sort figuring all of this out. It's almost an instinctual, emotional thing. The world is turned upside down by a colored man who looks pretty dark and actually looks a lot like my uncle, so I can identify even physically with this person as one of us. He takes hold of the Suez Canal. Britain and France suddenly are turned upside down, and then he succeeds. Then you've got improvement. And then you've got Sukharno.

Of course, Gandhi had already made his impact. You've got Nehru on the scene, and so forth.

There was no question, although that's the very period of the Beat generation, the mid-1950s. For white people, it was a totally dead, defunct, uninvolved kind of thing. This was when they were at their silliest. You know, Rome was burning. But for somebody coming along with an international interest or public affairs or government interest and actually knowing people from those worlds, sitting and talking to them, that's what it was all about.

This is one of the reasons why I'm convinced about MIT's great deficiency. We make up for it in part because we have so many international students. We do bring in the world here. For undergraduates, certainly for graduates, with one-third of the student body being international, there's every chance to have a diverse set of friends and so forth. We're among the higher proportions among universities for undergraduates too, so I think that's less and less the problem. It's just that even when the international students come here they lack diversity of interests.

Anyway, I learned at Johns Hopkins that I did not want to go into the U.S. Foreign Service because we had all these faculty from government there. The reorientation towards an academic career came slowly. This mentor of mine at UCLA had gotten me to look at Africa, but then, within that, I was still thinking in terms of the Foreign Service, government, policymaking sort of thing. To take it as an academic orientation could wait, and in some ways I haven't gotten there yet. I really haven't taken very seriously, I must say, the issue of engaging the sort of theoretical literature, as such, as a very important dimension to the scholarly work. So often I think people who do that are really sort of just filling gaps that need not be filled sometimes. They orient their work towards either whatever has been talked about among the theoreticians—sometimes with good reason and sometimes not, but in the social sciences we have much less clear tests of applicability and importance and so on. It's much more amenable to sociological factors, not even excluding ethnic ones, for you constantly to be dominated by the theoretical discourse and not attend to problems that confront real people, problems that are priorities for any conscientious person of color, anybody who comes from a victimized group.

But that's just to say that the academic world in that sense can be ivory-tower or disconnected and so marginal. My reluctance to embrace it thoroughly had to do with the sense that I'm more interested in applied work. That means you gain from it primarily because you may make a contribution to real life. But then on the cost side, the profession as such, especially for top-ranked research-oriented universities, this approach makes you invisible in the sense that you are not just second-class, but third or fourth. In other words, the notion that you haven't contributed to the theoretical material of your profession means you're not considered to be first-rate among the leaders of your profession. If the department isn't going to have people who are visible and powers, of course, the department would go down.

So that pressure is there. I have to some extent resisted it. But also I must say I do not feel a lot of internal pressure on me to do it, because if I had done it, they wouldn't have taken me seriously. After a while, you just learn where to put your energies.

You sound like you made a choice in your mind as to where you were going to put your energy. It may not have necessarily been where most people would think that one should put one's energy in, say, the area of political science. I know a lot of things you've done that don't go down in the record as being scientific, but they have been very significant. We'll talk some about them later. I just think that's a very important point for a scholar, particularly an African-American scholar—a young scholar—to hear what you're saying. I think I understand what you're saying. You have to make a choice about how you're going to give your life and what kind of things are going to make you feel like you're doing something worthwhile.

If you don't have some sort of internal guidance system about that, you can easily be turned off. Now that's not to say that theory isn't important. It can be. My approach to the theory side of it, and therefore that really crucial area of professional development and work, would be to say that you should create your theoretical tools in response to the problems you're working on. I've tried to craft some theoretical instruments for my own use, but I haven't sought to contribute to the theory per se. I'm then suspicious of people, especially young people, who set out to do that. I don't think they've grappled enough with the real problems

that are out there to be solved. But some people are just gifted and they come along and they have that creative kind of conceptual insight, and maybe they do make a real contribution.

We have a young guy now, Chinese, in our department. He's just fabulous. He thinks about the biggest questions there are. I'm astounded at times that he's struggling with these things. I have to admit that he locks on to certain key insights and uses them well and so forth, and if any young person is going to create a new way of analyzing, he's going to do it. Be grateful for people concerned with these things.

But I'm just saying there's a lot of pressure on you at a place like MIT to fit that mold. It's part of the prestige of the place and it's certainly a key element to the real science that goes on here. In political science, which at times places one on the margins, you want to think more scientifically about things as a kind of orientation. I accept that. I try to grow into that. But I do think at MIT we've had both the down and the up side of this because the combination of science and engineering poses those same issues. We have people with an applied sense—"You tell me what it is and I'll build it." There is an appreciation for applied work at MIT. I do sense often that there are pure scientists here who have an appreciation for the capacity to figure out what use something is and how to make the connections. So in that sense there has been at least a willingness to put up with the likes of me, in that sense—not just the little black boy from Alabama me, but the person constantly concerned about engaging problems of society and things of this sort, and doing a certain amount of work that really is extracurricular from a certain point of view, although it enriches the classroom. Often it does not feed much into research, but it reflects the notion of "we're working with real problems," and that becomes a kind of anchor or reality check even for those around you who maybe went off with this or that point of view.

We just had an example like that, I think, in my department this week—a rather serious, knockdown kind of intellectual debate on the most fundamental thing: hiring a tenured person. My argument was essentially that people have been rather highly touted for their methodological skills and contributions and that's essentially a kind of formalistic and superficial approach. They were arranging what's already known, as an approach,

and they weren't really creating an approach that excelled as a tool, that cuts through obscurities and enlightens and opens up things.

The good thing you could say about folks like myself is that they nonetheless are working with real people, movements and so forth. But since we had been led to put the emphasis in our discussion on just the methodological edge to this, that's when we are found wanting. I think you may remember the case of James Carter, the pediatrician and nutritionist from New Orleans. Here's a physician who has done original research in nutrition up here. Scrimshaw brought him in. He didn't get the offer. I was so shocked: I said, "Man, if this guy can't get hired, who the hell can you hire?"

So then I did my own little study. "What is this?" I asked. I went and interviewed all these people. I must admit, everybody responded and they gave me an interview. On the one hand, you've got Nevin Scrimshaw over here involved in everything, active in all these committees, and so on, and really out there in terms of his knowledge and contact with people. On the other side, you have Hamish Munro, who's writing article after article after article on how the body metabolizes vitamin A or B or whatever—not even our bodies, but rats and by analogy and so forth. And he said, "This man hasn't done any work." I said, "Well, he's got eighteen or twenty articles here." He said, "Well, I've got four hundred."

There was a disparity there, but in the end what I thought it came down to was a laboratory-pure-science kind of person versus, in the field, a how-does-it-impact-on-people kind of person—and how crucial it was for MIT to have both. In that particular case, it might not be so obvious how each should feed back on each other. In theory, what's learned in the laboratory and what it means to people out there could be clear, but the reverse direction is also important but maybe less clear. You say, which problems do you choose to work on? Well, you know, black people are different from white people with respect to high blood pressure, kidney disease, and so forth. Well, let's finally look at that set of problems. That happens because you've got people out there working with real communities who nonetheless have some connection back in the laboratory and start impacting on the way in which people think about which problems are important.

A great university like MIT needs to have both of those things. But we somehow or another didn't have room for a James Carter because he had twenty instead of four hundred publications. But his twenty publications are just fine in and of themselves, and he can also tell you what the nutritional vulnerabilities are for people in various circumstances and do something about it. So Munro said, "Well, what contributions has he made? I don't see the contribution." I said, "Well, let's look at his work with the Apaches or whoever it was." He said, "Oh well, yes, but where's the science in that? Where's the contribution in that?" I said, "Do you think maybe the Apaches were benefiting?" And then he stopped when he realized how ridiculous the thing was. "Well, yes," he said, "I imagine they may have gotten a lot of benefit out of his work with them." But you know, Munro was thinking of himself as working for all of mankind by solving these neat problems, and this guy was just saving the Apaches.

It's a very important point to make. Go back to the time when you were at Johns Hopkins and then leaving Johns Hopkins and going to, I think, Harvard. Could you talk a little bit about your choice to go from Johns Hopkins to Harvard and your experiences from that school to this school?

Well, Johns Hopkins was a good experience. It was a high-quality education. It was in Washington, so I don't regret that at all. It took two years to do a master's, but as I said, I went there thinking I might come out of there into the U.S. Foreign Service. In the course of time, I became more academically oriented, or at least I felt that I could more likely wind up doing both, that is to say, intellectually getting a grip on things and having some powerful impact, more through academe than by going into government service.

So then the issue is, "You're going to go on—well, where?" I had been to this summer institute at Harvard, so I had a little familiarity with Harvard. But I have to admit that when I first got the invitation to come to the seminar, Harvard was just a name. In my family, we knew the name Harvard, but we had no idea really. My family wasn't oriented to discuss issues of the best universities and things of this sort. My father, as I say, had gone to the University of Chicago. He must have known that that was "up there," but it might have been so far up there for a guy from Kansas that he

didn't look beyond that. So there wasn't any discussion. If they didn't have a football team or a basketball team that would be in the news, my more general community wouldn't have known about them. So I didn't know about Princeton. Yale and Harvard you heard about. That exposure of being able to have been for a summer at this international institute was important in that regard. I knew people there.

Then there was the university from which I had come, UCLA, and I also knew Berkeley, as I said. Berkeley was the epitome—or the acme, I should say—and I would have certainly gone there somehow or another if anybody had intervened and said, "Here's a fellowship, come." But that didn't happen. What happened was that my mentor at UCLA said, "Here's a fellowship, come to UCLA for your Ph.D." I wasn't so impressed with that, having been there already and more or less taking it for granted.

Now, the issue for Harvard financially didn't loom so large in my mind because, again, I already had a big fellowship. I had one of these foreign area training fellowships that will cover you four years. I spent two of them at Johns Hopkins and in my mind the other two were going to carry me through.

You could do what you wanted with it.

Oh, man, I just didn't think about it. I applied to Harvard. I had straight A's at Johns Hopkins. I did not have straight A's at UCLA, but when I got into graduate school, I had all A's. You have to apply before you finish the exams, so they didn't know when they considered the application the first time through that I had done so well and, more importantly, that I had gotten a distinction on the general exams.

But the thing that stuck in my mind was the rejection letter from Harvard. I'm saying, "Geez, I got straight A's at Johns Hopkins and I'm a little black boy from Alabama. What is this?" So I called up this guy I know in the government department and say, "I'm just flabbergasted. I would think they're going to give me money." He says, "Well, you've got straight A's?" I said, "Not only that, I just got a distinction on my exam. What does a guy have to do?" So he says, "Well, let me check into it." So he checks into it and he calls back a few days later. New information had come to their attention and, with their apologies, I was admitted into Harvard.

So then I focused on getting some money. They must have offered tuition because that was a hefty bill. I think they must have offered that, and then I think I went to the John Hay Whitney Foundation Opportunity Fellowships. I was dealing with all kinds of jobs. I made it through, and I saved my other two years of my Foreign Area Training Fellowship for the field work. Now I'm into Harvard, I was surely going to go there after all of that. Like I said, if Berkeley had called up and said, "We have a fellowship, come," I would have gone. But Harvard in effect calls up and says, no, you can't come and I say, "*What? What is this place?*" But not having any money and always having my back up a little bit, I was intent on going there.

I also knew exactly what I wanted to work on. Cameroon unification had emerged as an issue while I was at Johns Hopkins, so I was really focused. When I got to Harvard, I spent one academic year and a summer and did all the main coursework. I had already done a two-year master's. I negotiated with them to give me credit for one term of residency at Harvard for the two-year residency at Johns Hopkins. So you strip that to one and a half years. In that final term, the third term I'm there, I really wasn't there. I took reading courses, I took the exams. As soon as I was done with the exams, language, qualifying, and so forth, I went full-blooded into my dissertation work. I left really before that term was over and headed out to the field. But they counted it as residency because I had done the work. I did a little over a year in the field, came back and looked around for a job.

When you say the field, what does that mean?

I went to Cameroon to do research.

You stayed there for how long?

A little over a year, not all of it in Cameroon. I stopped in England and Paris on the way, did interviews in Ghana and other places on the way back. I was back here by January of 1964. I set out to write and quickly realized the only way this was going to be finished was to use the adage which is now famous among my family and among my students—"the only good dissertation is a done dissertation." So I set out to try to get four usable pages a day. If I could hit five, fine, but I would not quit until I had four—every day. And I was able to submit a draft at the end of that June, get feedback,

and get it signed off by August. When I stepped into the classroom here in September, it was an accepted dissertation and I came as an assistant professor.

One other point before you leave Harvard and your experience there. Were there any influential people anywhere similar to your mentor at UCLA?

Well, yes and no. Rupert Emerson was the person who supervised African studies at Harvard. He was a very noble man, prince of a man, extremely fair-minded, very smart, patrician in a way, but there was no bleeding-heart sympathy in his approach. It had to do with nationalism sweeping the world. He wasn't opposed. That didn't scare him, so in that sense he was a nurturing, good, positive role model. In fact, he hired Vivian to do work for him. So we felt very good about that relationship. While I wouldn't say it was close, we were friendly and there was no tension in it at all.

I probably should have thought more about hierarchy and people over you and that they can say no and where would you be, and so forth. I really didn't think much about that at all because of the intellectual problem I was working on relating to how to achieve African unity. I thought, "Try to solve it, move ahead." It also went by like a blur. Like I said, I had no money. By the time I'm writing this dissertation, I've got two children. Life is serious.

No time to waste, right? So you came here. You came to MIT as an assistant professor. Could you talk a little bit about how you got here, given the fact that there's nobody really like you here in that position?

Ron McLaughlin was the only other black faculty at MIT at the time, but I didn't really know that. It was a fluke in that sense. I still was oriented to Berkeley in my mind. I was focused on writing my dissertation and getting out of there. Along about April or so, even on into May, I realized this is going to happen. I've hit my stride, I'm writing and it's flowing, and I can think about being on the job market. I went over and looked around on the board at the department for job listings and so forth, but I did not have sense enough to go and demand to see the placement officer, or even know that there would be a placement officer for the department. It did not occur to me that there was somebody in the department whose job it was to help you find a job. I was just disconnected. Rupert Emerson didn't say, "There's this job,

there's that job, and now you should get in the queue and do this that and the other." I was focusing on getting this dissertation done. I didn't hang around the department. I wrote at home. I wrote from before sunrise until the hours of the night every day for about six months. So I really didn't think a whole lot about job-hunting.

I tell this as a funny story about myself, but it's kind of pathetic. I thought I'd get a job at Berkeley because I was deserving enough to get a job at Berkeley. But Vivian in her nice calm self said, "Well, did you apply?" I said, "What do you mean, apply?" I thought Harvard would send out announcements about who's on their list of students now finishing their Ph.D. and so forth, and then you would get this offer. Then it dawned on me, not only did I not apply, but it's pretty late in the game, actually. So I could send a letter. I didn't really know anybody at Berkeley. I had better fill in, I had better scurry a little bit, take care of my family. So I thought, "Well, okay, what I'll do is I will go around to each university in the Boston area and offer to teach a course." If I had to, I could teach the same course five times, maybe, or two courses or something of this sort. I put together a whole program.

I vaguely knew about MIT having a political science department through one of the students in my group that I had led with Crossroads Africa in the summer immediately after my Johns Hopkins stint—I led a team of students to the Republic of Guinea under Operation Crossroads Africa. That was a tremendous experience and that's a whole other story, but one of the students in that group was a physicist whose life was just turned around by the experience. He was so profoundly affected by that experience that he decided to change fields. When he came back, he became a student in the political science department at MIT on the basis of his super mathematical skills, scientific training and so on. He was that kind of person. He had this experience with African development and so forth, and he became a political scientist. He got his degree from MIT and went into teaching, although not at a big advanced research-oriented university. He may even have switched as an undergraduate and taken his undergraduate degree from MIT and maybe a master's somewhere else.

So while I am finishing my doctorate at Harvard, he let me know a certain amount about the political science department at MIT. Then I

looked up who was in it. Dan Lerner was one of the people, he was chairman. He had written books that I knew about. Rupert Emerson could tell me a little bit about the others, but fundamentally it was Lerner. So I just walked down there and knocked on his door and said, "I'm just finishing up or I will be finished and I wanted to talk to you about the possibility of teaching a course in the department." Now, I had been smart enough at least to run to the library and get the man's other books and be able to talk to him a little bit about his own work. But if anybody else had been "on seat" that day, as they say, if he hadn't been in and somebody else had stayed in his place, it would have been over.

Well, it so happens that one of the Sloan family—I don't know if it's Alfred Sloan or not, but I think it was one of the daughters or nieces or something, perhaps a woman named Ruth Sloan, who is an Africanist in Washington, DC—that family had made a gift to the department without designation for a chair that probably was in the donors' minds meant to promote African studies at MIT. The department had used it to hire a series of visiting people. They had already contracted to have a visitor come in with that money who backed out at the last minute. So in fact, they were looking for somebody. They weren't on the market, but they were suddenly caught short. I didn't know this. I didn't realize they actually needed a Godsend. So they checked me out, I'm sure. No one ever told me about the kind of checks they did and who they talked to. I didn't have to give a job talk, but I did show my work.

You got into this story much later, because I pointed out at a certain point when you were helping me, that this nice Dan Lerner—super-liberal and all this—hired me at the lowest incoming salary in the whole Institute at that point. Here they had all this extra money; but I just didn't know better. I was happy to get the job. It was only later that I found out that I was below the charts in terms of starting salary. Bob Wood corrected that, but even so, having started late and trying to catch up meant that for years you had a pattern of disparity which I don't think has ever been closed, much less corrected. So I can't say that it's an unmixed blessing to have been here. I can say that I had my reasons for knocking on the door. I was happy that they opened it and it's been a happy fight ever since.

When you actually came in, they hired you full-time?
That's right. I had come and asked for one class. Initially they said, "Well, yes, but we're not interested in one course. Are you willing to work full-time?" "Well, of course, yes." But I only wanted to do it for a year because I was waiting for my offer to come from Berkeley. So I just signed a one-year contract.

Do you remember that first year or two, particularly the first year? What did you take off on, I mean, knowing there's a pattern to your approach?

No, no. I had to now think about turning the dissertation into a book and I was struggling putting together courses. It was a full teaching load. I didn't have any time off from that. There wasn't anything activist in the scene at that point. I was raising money still for SNCC and stuff like that. They're sort of on the downside, over that hump by this time, but the assassinations and things of this sort were on the horizon.

Once I got sort of set, the department gave me money to go back to Cameroon and do some more stuff. It was fun. I got plenty of support in everything, lots of tolerance. The big issue was, since I had a one-year contract, changing it from a one-year to regular. Now, that was really Bob Wood's doing.

Is this the same Bob Wood who is at Wesleyan now?

Yes. Bob Wood took over as chair from Dan Lerner right at that point. Bob Wood calls me in and says, "You have a fine preparation, background, and so forth, and we actually do need somebody. Why don't you think about going into a regular, three-year cycle?" In order for me to do that, he then told me what I would have to do. "One of the things you have to do is you have to become known to all of the faculty, so you should systematically have lunch with each and every one of them. They get a chance to know who you are, what you're doing."

So I did that. We had various activities going on that people would talk about. So it wasn't a job talk, but you had a chance to demonstrate your interest and capabilities. I had very good feedback on student evaluations and it was just a good trajectory. As it turns out actually, a one-year cycle where right away you start thinking about extending it, that's a big hurdle, but it's also an easy hurdle in a certain sense. It would have been harder if it had been two years, because they would have

more time to think about it, you would have gone through more hoops. But it's almost immediately, you're going to hire this person or not on a regular basis.

That turned into a three-year contract, and that really is Bob Wood's doing. As soon as I had the dissertation accepted by Princeton University Press, top press in social sciences, I was sort of home free in that regard. I didn't realize how long it would take them to actually get the book out. The book came out in 1970, they accepted it in 1967. One of those years there were certain revisions and the index and so forth. It took them almost a year to accept it. I guess I gave it to them in early '67. I didn't hear until the end of '67 and then had some slight revisions to do and so forth. But by '68, I figured I'd got my book, I've done a certain amount of work, I had several chapters in books by then. And all hell was breaking loose in the country, so I put in for a leave.

This is around 1968.

'Sixty-eight, yes. I had joined with Mel King and Hubie Jones and a number of other people to create this thing called Circle. That was already under way and, now that I've gotten my academic stuff all organized, I'm really drawn now into the exploding scene here—not only around the U.S. but in the world. I mean, it was a tough time. I felt the tension all the way through. For me, the problem always had been—here I am off doing a study of Cameroon. In fact, I remember having a discussion with the U.S. ambassador—white, from Kansas actually—in which I said that I shouldn't even be here, I should be home. And he's trying to say, "No, it's important to do something longer-term." That's another story.

So that's when I took the leave, a two-year leave. I'm now up for renewal. I've gone through most of the three-year cycle. The key thing is that I've got the book in the press, I've got some chapters, et cetera. They're coming up to renew; they renew. I worked full-time to create Circle off-campus—in town, but off-campus. In the course of that, towards the end of that, I would come up for a tenure decision. And it's Bob Wood again who takes up the tenure case. They had three slots and three rights activist-oriented junior scholars—myself in the black community, a guy named Leonard Fine in the Jewish community, and the only liberal Republican in the country, who had

started something called The Ripon Society, a liberal youth group. We were all scholars, but we were all activist scholars—highly visible people, and so on. We were all up for tenure at the same time. We thought we had three slots, but the provost said, "You have one."

So now it was, who was it going to be? Each of these guys was in some ways from an out group. Of course, the Jewish guy was the least out group in that sense because they're mostly Jews who are making this decision. Anyway, it took them eighteen months to resolve this thing. Bob Wood had to come back time and time and time again. Somebody would say, "Well, his teaching isn't good." He'd say, "Well, wait a minute, let's go back to the record and look at it." Then they'd lay out the evaluations and say, "Well, actually, the only one here who's got stellar marks is Willard, not the other two. They're all good, but Willard's super," and so on.

So I credit Bob Wood for really being willing to go to bat. He couldn't have done it by himself, but the point is that it took that extra commitment to really honcho this thing through. Now I'm naively off creating an urban development company and not even around to find out what I should submit or not submit and so forth. Then they asked me, "Well, give us a list of names of people we can write to, to get the letters of recommendation." I put a bunch of Africanists down, but then I include the president of Cameroon, Amadou Ahidjo. What a dumb thing to do. But I felt that social science scholars should be accountable to the objects of their research. They fortunately didn't write to him, and if they had, I don't know what the man would have said. But, you see, God looks after you. Some people walk around with a little cloud over their head, others have sunshine wherever they go. So I felt blessed in all that. That could have turned out a whole lot different. There were some good people along the way.

The general issue had to do with whether at MIT there was an appropriate appreciation for the applied work. My research agenda was pretty clear and not unusual. I had a dissertation on a case study in Africa of political union—political integration. I had taken a unification movement and, to turn that into a book, I needed to put that movement into context and to deal with it in a broader frame, which I did do and I got some support from MIT to do it. I had time off—well,

a little bit of time off—and money to go back and do some more field interviews and stuff for a summer. So my trajectory initially, I think, was not at all unusual—with the exception, as I mentioned to you on more than one occasion and you had cause to champion me, that I had come in at an artificially low level because of Dan Lerner getting away with that stuff. I was naïve; what did I know?

But all I'm saying is that, in addition to the salary level, it was an unusual entry to MIT initially in that I took the initiative. They didn't come to me, I came to them. There was the business of Bob Wood taking me in hand and saying, "Look, if you want to stay longer than this one year, that's feasible. But for that to happen, to go into a regular three-year appointment renewable as you come up to the tenure decision, this is what you need to do." He told me what that was, which was essentially, "Get to be known by the other people in your department. Don't sit in your office, a recluse."

So I did. I went around, met everybody, made sure they knew what I was doing. That's unusual in that usually when we have a junior hire coming in, we've done a job search, they've come, they've done a presentation, and they come in with an appointment that is three-year or so and you expect it to be renewed if they're on track. At the end of the second one of those cycles, you would come up with some sort of promotion and judgments would start being made about whether you were likely to get tenure, and you might get an early warning at the associate level that you need to do stuff to get ready for tenure, et cetera.

So I'm coming in on a one-year initially, where nobody's thinking about this as a regular. But when I come up for renewal at the end of that year into the first of that normal cycle thing, I'm already here so there's no job talk and things of this sort. But from then on it's just, "What kind of research are you doing?" and "Do you know that you have to get your dissertation into a book and it needs to be a good book?" And I did all that. Having done all that, I then go deep into the applied work, in fact, in a somewhat different field. I say "somewhat" because I'm focusing on political integration in Africa, but I'm also increasingly focusing on development policies and institutions in general. So when I take a leave of absence here to go and set up and run Circle, that's really within

the same framework of the concept of development promotion. I use the African experience as a kind of model for that. I didn't see that as a very great change of orientation and so forth, but it was unusual in this sense—that the department did not have, nor did I, any real understanding about whether what I was doing at Circle would be a basis for renewal and tenure here.

It was foolish that I didn't think really much about that. As it turned out, most of what I did at Circle proved to be very attractive to the department because they were not really totally committed to the Africa side of things. Increasingly in that period of turmoil in America, they were concerned about ghetto development, inner-city politics, things of this sort. My new experience catered to that.

So when I was in the midst of that work, and now I'd been here five years, I took this leave. In the sixth year, issues about promotion come up. I have discussions with the department chairman. Now they're centered on, "Are you also willing to teach in the area of American urban politics?" "Yes, I am." When I actually come back from two years at Circle, I have a number of publications in hand, in fact, bearing on that.

Now, I say publications. These included a number of research reports. For example, one of them was a two-volume study of solid-waste management approaches in twelve cities across the U.S. That involved a consortium of research organizations and people. One of the people in that consortium was Donald Schon, one was Henry Jacoby, who is now at the Sloan School. So this was an academically framed kind of work, but we were doing it as consultants outside the framework of MIT. Circle was actually the prime contractor and they were sub-contractors, because we insisted politically that no one from outside the black community was going to work in the inner city and be in control of it. "We'll be prime, you'll be the sub-contractor," we said. Schon and Evelyn Murphy, who later became state secretary of environmental affairs or something—they had this organization called Technology Innovations or something like that—were sub-contractors. That's before Schon came to MIT. He came here after that as a Presidential Professor.

Anyway, when I come back, I've got that study. It's not all my study, but I'm the principal investigator. I'm the manager of that study. I also

have a number of studies focused on the Boston area for development planning. Circle had some consultancies around television programs aimed at dealing with race relations in inner-city affairs. WGBH had a series called "On Being Black," for example. I did the evaluation of that series. So I had this stack of stuff, along with things I had done on the Africa side. I continued to write about Africa during that period, so I had three or four chapters in books. I had the Princeton University publication of my book, which was not just the dissertation. The dissertation fed into it. The dissertation was like two and a half, maybe three out of six or so chapters—a little less than half. So that was all major new work. I was asked would I be willing to split my time—urban politics, African politics. On the urban politics side, I then ran courses for several years around community and economic development. One I called "The Colonial Analogy," which looked at the inner city as if it were a colony and the policies dealing with it as if they were colonial policies and the development process as a decolonization process.

You were radical.

No, I wasn't. I was just dealing with the realities. That was, I think, a good, popular course. I never really, though, published on this theme. I wrote a major paper called "The Colonial Analogy," but never published it. Where I fell down—and I keep looking back on it and saying it's really a mistake, that I was really falling down—was not to work on getting good publishing outlets for the stuff I was writing. Quite frankly, looking back on it, half of what I had written never got published.

I heard a lot of it was good stuff, too.

Well, I thought so. It's just that I wasn't attuned enough. That's where mentoring, perhaps, in terms of the professional side of things, maybe a little bit better connections would have helped out. For example, I did a study for Abt Associates in the early days, one of my first consultancies. It was an analysis of Nigeria from the point of view of the kind of interethnic politics that was undermining the stability of that state. It provided a framework for understanding the first of their civil wars, coups leading into the Biafra War. That should have been published. It was an excellent paper. It needed polishing and so forth. I did the paper and gave it to Abt Associates, got my money, and that was the end of that.

Now if I had come from a different tradition, that would not have happened. In some cases, a lot of the stuff I did—for example, on South Africa—was done with the notion of kind of moving the political process. Some of it was published, but it was published in marginal publications. But here, again, from the professional point of view they're marginal; from my point of view, politically, they're not. They got to my audience. So Hoyt Fuller asked me to write something for what initially was *Negro Digest* and then became—what did they call it?—*First World* or something like that, or *Black World*. That had a good black intelligentsia audience, but it wasn't doing me any good whatsoever in terms of the profession. I wrote a series of things like that, testimony I did for Congress on why we needed to disconnect from South Africa. That's not unusual. There are any number of professors who will time and time again go and give testimony to Congress. I gave testimony. The difference is, I didn't polish it and publish it. I just presented it.

Were you tenured at that time?

Yes. I got tenured pretty early and maybe that's one of the reasons why I didn't publish all this material. When I came back from Circle with this stack of stuff, and an agreement, I really got tenure right then. The decision was made in '72.

That was really early.

Well, seven years. That's when it's supposed to be. I came here in '64, don't forget—especially taking two years in the process. I mean, I stay on track even though I've gone off. So I'm not really thinking in terms of, "I've got to get the publications into really top-notch professional journals." My concern is, "I need to think it through, write it down, put it out there."

Where was Wood at that time?

He probably had become head of Model Cities by the time of my case. He championed my tenure. I don't know, perhaps he was still chair of the department. You see, Dan Lerner was chair when I first came and then—my memory is a little hazy—it may be that there was a slight interim, but soon thereafter Bob Wood took over. Bob resigned to go and run the Model Cities program. But one of the last things before that happened was for him to proceed with my tenure case. He may even have continued on that after he left, because when I actually had the discussion with Ithiel de Sola

Pool—about whether I would teach urban politics as well—was after that. When I came back, I continued to do that, that split.

Wood sounds like he was probably one of the closest persons whom you'd maybe call your mentor.

Oh, absolutely. He's the one who is looking at this positively, in terms of taking steps to see what is actually needed. Everybody else is just there. I didn't perceive them as hostile, I didn't really perceive any hostility. I don't think there was any. But it wasn't as if anybody else really went out of their way to help me.

Initially, I don't think there was any hostility to my initial hiring, but there was certainly hostility to the notion of my getting tenure. Some of that was because—the best face you can put on that is—they had favorite candidates. You had Leonard Fine, who was an activist Jewish figure. I think they were closest to him, but then perhaps they were a little uneasy about the lack of diversity in the department and so didn't want to just go straight ahead with choosing him. But there was very strong support for him and he was good, there was no question about that. He was an activist also, which helped because you couldn't say, "Well, this is a choice between scholarship and activism." In fact, there were three candidates, and all three were combinations of activists and scholars. The third person was Jack Saloma, who was an activist as a liberal Republican. He had started the Ripon Society. He was prominent, and that served the department well. They were not all "radical Jewish leftists," as it were. We had this Republican who was leftist. Then we had this black who was leftist.

Then I just had to decide, did I want to and could I in fact keep these two different roles of Africa-oriented studies and urban American studies? Increasingly, each one is very demanding. To straddle them was difficult, so I pushed for us to actually hire somebody who knew something about black urban politics. The first such person was Lorenzo Morris and the second such person was Emma Jackson. I thought Lorenzo did a really good job. We didn't get very far with his promotion. I really went to bat when he came up for his promotion.

Are you aware where he is now?

Yes, he went to work at Howard University. He got an award the following year, so I sent around the award announcement.

Rub it in, right?

That wouldn't have changed anything. It just wasn't appreciated—in part for the subject, in part for the person. But, here we had somebody doing urban American politics, so I could then go back and do the African side.

Before you go any further, talk a little bit about Circle. That was a major undertaking. And to understand, here is a young assistant professor going into the black community and orchestrating an organ that really worked in a very important way.

I have this young student working on this case now. He was sort of floundering. So I posed to him a problem, which he is misinterpreting and treating as a failure rather than focusing in on the aspect of it that was the problem. The aspect that was the problem that I want him to flesh out and really grapple with is the mix of motives that it might take for an organization to serve the general community interest and at the same time satisfy enough individual interests of people for things to click. Circle didn't last for a very long period of time, and a lot of the businesses that it started failed and so forth, and he's saying, "Why did Circle fail?" I respond, "You can't say that. Look, man, we went from nothing to a staff of sixty people. We had six different operations going."

And nothing like that has happened since.

We did a lot—although I'm still intrigued by that aspect of the issue, because I don't think we solved it.

That issue being?

The mix of general, collective interests versus individual interests. We needed to find a way to commit people to the collective interest. One way to do that is ideology. Another way to do that is to build a context that would allow people to do the other things they want to do. They would use this mechanism to build up a framework and then they could make good on their own projects within that framework. That would be a mixture of the individual and the collective. One of the things that we were not prepared to do—we didn't have the means or the inclination—was just pay people to work for this, that is to say, use the attraction of very high salaries and pay the board members. We couldn't do it anyway. It was a non-profit corporation. We weren't willing to set it up as a profit-making operation. We were working not just on

commercial lines. The businesses we were funding and investing in were commercial, but we wanted the organization sponsoring all of that to belong to the community and be devoted to the community and not be mercenary within itself. We still confront the problem of how to motivate people to work on that kind of stuff.

That was a very telling experience, but that dimension of the experience I never really, until later, would have been able to grapple with intellectually and academically. I don't know if anyone has, and I don't know if I would want to now. I want to, from a memoir point of view, but from a professional point of view I think that we don't have very good work done on this except for the sort of theories that I've put this student to working with.

But that's another story. I'm just saying that there was a richness, a really profound richness to the issues, even just organizational theory issues that one might have made something out of. Rather than that, I dealt with it more as an approach to promoting economic development on the ground. I used it in my classes and I used it in my discussion on colonial-analogy writing. I think there was an appreciation in my department of both the service contribution and of the kind of urban-planning type of writing that I was able to bring out of it.

So I got tenure and once that was done, I continued to discuss the colonial analogy and use it as a planning tool for community development corporations. I did a joint seminar between MIT and Howard University. I went down there one day a week, and at the end I brought that class together with the class up here. It was great. I was interested to show our students here that they had equal counterparts and vice-versa. I did that one time, but after about 1975 or '76, I dropped all that. In '76, I took my sabbatical and spent ten months traveling through Africa and then got into the development banking analysis stuff.

Did it ever happen that you made a conscious effort to get your activism focused more away from this place—to do the kinds of things you wanted to do as opposed to spending much time here? Was it ever sort of like using this as a camping ground, but you basically wanted to be out there in certain areas?

Well, I wouldn't put it that way. I think you could say the Circle period was going "out there." If some-

body had told me, "You've got to choose at this point," I don't know how I would have answered it. In other words, what would I have done if, before I went, somebody sat down and said, as a mentor ought to do, "Look, the kind of publication you have to come up with is not going to be an applied publication. A study of solid-waste management practices across the country is not going to do it. You have to tell us how that fits into the kind of politics of inner-city development, or something." This was not in that study. It was just a study of what the problem is, how much waste is there, what kind of waste is it, what's the system to handle it, what are the cities doing about it? There was a policy question in it—should we go to recycling and how should we solve this problem? But we didn't take that very far and that wasn't my part of it anyway. Even with respect to South Africa—and I am fairly well known around the world as one of the founders and leaders of TransAfrica and one of the important architects of the American anti-apartheid movement—most of the considerable amount of stuff I wrote was not professional political science per se, and was not published in professional journals. It was testimony to Congress, strategy papers for activists and elected officials, op-ed pieces, articles for more popular outlets. I would not have gotten much benefit from it in a tenure evaluation. Fortunately, I was already tenured. Maybe that is the real value of the tenure system today—to allow for controversial work of political or social significance. But you have to get tenure first.

So, what if I had faced the kind of situation that came up recently regarding a tenure case I chaired and promoted for a colleague who was looking at peasant movements and dealing with what the peasants want and what they're doing? The reaction was, "Well, he doesn't tell us very much about what this means for social change generally. The theoretical connections aren't good enough. It's not social science enough. So we're not going to give him tenure." If someone had told me all of that, I would have been really in a pinch, because I would not have been inclined to devote myself to the general theoretical framework defined by the literature in urban politics. I would not let the gaps in the theory of that define what I should work on, versus being guided by the problem people are confronting in the streets and the problem you confront trying to engender an

income flow and jobs, and so on. There could have been a way to write about that after the fact, to connect it to the literature. But my fundamental motivation was not to fill the literature, it was to do the job. I did not feel pressed to see that as a career choice, that I was jeopardizing my career by going out and trying to actually create something that met the economic needs. We did have a theoretical framework in which this work was couched. It was quite an elaborate theoretical framework, but it was not what I intended to write up and put in the literature. I wrote it up in proposals here and there in order to get funding. We laid out our approach, which fundamentally came down to creating our own economic base for political action. That's how Circle fit into what Mel King was doing with the new organizations he was creating, the Precinct and Neighborhood Development Corporations.

But nobody posed that choice for me. I didn't feel that pressure and it worked out okay. Today I wouldn't ignore the career implications, knowing what I know now about MIT. If we had not been coming out of the turmoil of the late '60s and the '70s, even they may not have reacted to it in the same way. When I come up for tenure having done this work, it's seen as a positive link, you know what I'm saying?

Exactly.

Now, I don't want to say I got my job because of H. Rap Brown, but he's somewhere in the picture.

And a lot of other folks down there, too.

That's not to say that somebody should say that's just "affirmative action" and "for political reasons, folks felt pressure." It was an issue of relevance; but there was a recognition of relevance that disappeared when my group ceased to be a threat.

What I hear you saying too is that you don't really believe that you received a scholarly mentor at that time but you really lucked out, so to speak.

I lucked out, right. But I would have been a difficult case to mentor. Bob Wood had his own troubles with these same people. People in the department felt a sense of pride that we had a big name in Washington, but there was a sense that Bob Wood was stepping into muddy waters. I think, probably in some respects, there may even have been that sense with regard to others. Moynihan went down to Washington. Not to put

Bob Wood in the same category as a Kissinger, but you had a lot of people going to Washington and doing things. That's always given a positive valence, but it's still also seen in terms of the comment, "He never published anything great since." Bob Wood went down, he had published the megalopolis stuff, "five hundred urban governments." That's his last academic work. Since then he headed Model Cities, he then became Deputy Labor Secretary, then he came back and ran the Boston public schools and people thought of him as a case of unsatisfied ambitions.

To have set out to mentor me from an orthodox social science point of view would have been futile. I would not have taken to it. I would not have sensed that it was a proper choice for me. Thank God there was enough going on in the society, questioning the whole paradigm anyway. "The death of white sociology," that was what that was all about. The whole notion of relevance as some test for what you were doing was coming into vogue. That was a general phenomenon in this society, intellectually. It didn't all fall on our heads alone.

As time goes on, blacks continue to do that work and you have a case today, which you probably know about, on the other side of campus involving the same kind of issue. Here's a guy who has done superb work around issues of how you actually protect yourself as a community, advance yourself as a community and so forth, and people are saying, "Well, what's the level of scholarship?" and, "Does it place this person in the top ranks of urban planners or social scientists?" Well yes, in terms of *that* problem. I hope to God that we don't have yet another example of non-success in a tenure case because there isn't enough understanding of the relevance and the universality of the problems and experience we have as black people. That's the other thing. If you solve this problem for blacks in an inner-city area, there's a disinclination to think it's relevant to solving the same problem anywhere else.

Therefore, I don't think of it as a kind of general failure of mentoring, really—in today's context, perhaps. If you were looking back, you would say one needs somebody who is well positioned to know what's coming ahead, who really should give a junior colleague some sense of what the risks are. I don't fault Bob Wood for not saying, "You're taking a risk to go off and do this." I think he

breathed a sigh of relief when I came back with a bunch of significant writings. It's a tough one, because in what way should we sacrifice the people in order to fill a few academic posts?

With all of your experience now, if you see a young Willard Johnson today, based on all your experiences and what you see down the road, what advice would you give?

Well, I sort of give contradictory advice. I think the present case is a good example of this. He needed to publish the last two books that he's published and they are not off the track of his interest in actual community empowerment and things of this sort. On the other hand, if he were really aiming at either sociologists or political scientists—and urban studies, what discipline is that? That's an interdisciplinary program—he would probably be pushed to talk much more explicitly to the theoretical literature in his field than he does. Then you would say, well, that's the way to make sure you have it both ways.

But it's hard to do. It takes time and energy. He did a study for the Boston Foundation of all the literature dealing with poverty—what it was, really, maybe perceptions of race in the city. The point is that he went through tons of literature to do that. He categorized and organized it. They would have asked, “Did he add his own new theoretical frame to it?” In other words, is this review of the literature a basis for a new theory on these matters? Well, I can't say that. I don't think so; maybe not. But I think he's done a tremendous job of assimilating it, organizing it and making it accessible, and using that as a basis for how we think about problem-solving. But it doesn't have all the trappings of “a new theory.”

That standard of professional development—the hurdles one has to clear, so to speak—that is held up is to develop the task of developing new theoretical contributions, not just pieces of it, but somehow or another to create a highly visible theory. Well, that is something that is to me dangerous, actually, in assembling a faculty in which every member is sort of equally a stellar creator of “the new theoretical framework.” In my mind—I may be wrong on this—I don't think you can do that in many, many, many cases and also really have your feet on the ground, so to speak, and really understand how the world works in real-world conditions. You're abstracting from these problems

and creating and modeling it intellectually so that you can test certain propositions, and so forth and so on. It is so demanding and it's so impossible to do, and it requires you to step back from operationalized dealings with things, so you would wind up with people who really don't have much of a sense for how things work, actually work.

So I'm skeptical that you could build a whole department uniformly with people who are stellar because they are considered to be the theoretical leaders. You have to master theory, you have to deal with theory and in that sense contribute to theory, but I'm just saying you're not going to build a whole department where everyone is equally a theoretical scholar. You need to have the applied—not the “everyday,” but the more applied, more mundane, more on-the-ground or practical—exposure. You need people like that. You need people who know how the institutions work, know some of the people in the institutions they're studying, know the complexities of what it's like behind the scenes, and therefore who know some of the reality that you couldn't prove but you know to be true.

Black people?

Yes, but not just blacks—anybody who works intelligently in the world. There are lots of things you know that you will act on because you are sure, but you couldn't prove.

Tell me something, for example, that you learned from Circle that you don't think you can theoretically prove but you know is a fact.

That the capacity for, if not the inclination towards, altruism is widespread. I know that there are people who are committed to the general interest and who will work hard for it, but I cannot prove to you that that's a universal motivational component. And I cannot prove to you what exactly are the contextual factors that will elicit it. I know we had a Chuck Turner or a Mel King or a Willard Johnson who worked day and night sacrificially. A lot of people will do that, but I cannot tell you what it is that allows you to identify their psychological profile or their motivational background or their upbringing or their socio-economic status or whatever else that will let you know that when you have this circumstance, you're going to get this kind of person. Therefore, I don't know how you can be sure you can build an organization that will always bring

those people out of the woodwork. I think that if you do have such leadership, you will attract more such people.

Black leadership?

Right. I also know there is some cynicism and a lot of people will distrust those motives regardless of what's going on. That's also a factor. You do have to constantly find a way to allow people to think that their benefits are protected, whether or not this is true—in other words, not to have to rely on the beneficence, so to speak, of the leadership. It's really like people go to church and they'll put money in the basket, but not all their money in the basket. Sometimes they won't put it all in the first basket or in the second basket, they will split it up so that some of it will actually get to the missionary work and the rest of it will wind up with the minister.

So you get to have a feel for it. You have organizational structures to make it possible for these payoffs to be there, but you couldn't elaborate that into knowing precisely the circumstances under which it's going to work this way and this is proof that you're dealing with a genuine person. In the end, somebody you thought was good is going to turn and do some bad things and some of the folks that you never had any hope for actually turn out pretty good.

That's just a rough example. I can't say it's a lesson I've learned. Now, in the African case, I do believe that we are struggling with lots of theoretical problems on how to accomplish development. I have not yet really elaborated a theoretical statement about them. I suppose if I were to devote myself to a theoretical problem, it would be to explain why and how to indigenize the process. You can put it in the framework, I suppose, of capacity-building—you have to indigenize this process. You have to find ways for people within the country to control the process, develop the resources, and yet you will need outside assistance. It's the way in which development sort of becomes self-development, in a theoretical framework, and in which outside assistance can come in and yet foster internal capacity to direct and control and promote.

That's what I want to work on, but that would require enormous energy, so I'm probably not going to do it. Rather than that, I'm going to just work on certain aspects of how a foreign aid program might be sustained with a weak political

base and what that may mean for the shift between the focus on aid versus trade issues, industrial assistance to indigenize the industrialization process. It won't be grandiose, but it will be significant. If out of all that fine theory develops, that's great, but it's not my motivation to theorize.

I think probably my advice to most young people would be that, really, at least the race—if not the country—cannot yet afford to waste all of our talents in theory. I'm not putting down theory. I'm just saying that the structure—the marketplace, so to speak—for theoreticians is largely closed. It's based upon lots of institutional and in some cases ethnic realities, or you can think of it as networking frameworks. Certain people are in a position to say what they think is important whether or not they can show that it's really important. If you don't get into particular journals, you aren't taken seriously, and yet the rules by which you get into those journals don't map onto real problems very well. So you wind up going through all these hoops and doing all this networking and working the system and so forth, in effect really in order to preserve the structures that are already there. In most cases that's not really going to address our problems, which is one of the reasons it is such a shame we don't have good journals—not good in the sense of high-level, but able to be marketed, known, visible, and to sustain themselves, and so forth.

Have we ever had one come close, by your assessment?

Well, yes, *The Black Scholar* was at one time really a good journal and I thought that *Negro Digest* was good. Hoyt Fuller did a fantastic job with that journal. *Phylon* was good at a certain time. There's *The Journal of Negro History*. There have been times when the journals were there; I think right now you'd be hard put to name any. Part of the cost of not having those journals is having to kind of play a game. It really is a game. It's a game that's not really connected to advancing praxis, that is, the application of sound theory to real problems in a way that solves them.

So it's not easy for a young person coming into this field now. They must feel torn in a way that we haven't seen in a while because the problems are so great and so overwhelming. The disconnect between the requirements of being successful in academia and actually impacting on these problems seems so enormous.

I saw Paul Gray today and I told him I was coming to see you. He said if there's anybody who knows about MIT, Willard Johnson does.

(Laughing) Coming from Paul—oh, come on, Paul!

I'm serious. That's what he said to me. It brings up a question that I wanted to use on the tail end of our discussion. I want to ask you to give a brief summary and experience of your perspective on the MIT experience as a faculty member.

Well, let me tell you, the frustrations that have led me to consider early retirement essentially come down to the difficulty in getting these departments—and I start with my own, time after time after time—to appreciate the quality and relevance and significance of black scholarship. It is just an overwhelming problem. Some people may really have a racist bias. They will be surprised themselves, probably, but the blinders are just there. It's not "their group." They know these are problems, but there's no real respect for even the significance of the problem to anybody else, nor for the work done on it. It's just frightening—case after case, time after time—seeing the ways in which people seemingly so open and honest about grappling with intellectual problems and so forth just can't quite get it.

Quite frankly, I'm sure I have advanced cases that were too weak, but it's certainly not the case with our present one. They ask, "Do you want to discuss that again?" I'm going to force people to think about it even tonight. We have a meeting. If they can't bring themselves to offer tenure to Richard Joseph, there is something fundamentally flawed in how these people think. I can't explain it on any basis other than racism, however subtle. After all, he had two major books and a third of significance, a series of key articles in major journals, and many notable chapters in books. He had run a major Ford Foundation program in West Africa and had run the Africa Program for the Carter Center. He was the key figure in designing and monitoring the first really democratic elections in Africa during the '90s. Despite all of that, he was denied tenure here. It seems that no serious black person can measure up for these people, perhaps precisely because they really are serious. That's been the problem. If they can't come to give tenure to a James Jennings, there's something fundamentally wrong. I already mentioned to you

James Carter, years ago. The benign aspect of it is understanding the way in which these people have grappled with the problems of people they care about, more than grappling with talking to the establishment of scholars, who may or may not care about those problems or people. In the end, the institution goes on essentially being the same, despite all the meetings on diversity and affirmative action.

I used to say to visitors to my office, "I hope they don't tumble down on your head"—the boxes of stuff piled up from the various committees on equal opportunity. There's all this discussion about the value of diversity. In some cases, we just said "affirmative action" and in other cases we just said, "We need to have a broader array of perspectives because it's good for us pedagogically, it's good for us in terms of a gender setting, it's good to mentor the people who are here, to connect with society," and so forth and so on. But it's all just said as if they're mouthing it. When it comes down to real tests, they say, "Well, somehow or another this person doesn't quite measure up." And I'm sure with this group that's here—you take my tenure case outside the context of the time, it probably would not have succeeded. Yet there's nothing flawed in the record that I put on the table there. It was good, theoretically well-constructed work I had done.

So the MIT experience has been awful from the point of view of struggling with the issue of making this discussion of diversity in the social sciences connect with practice. That is true for urban studies, economics, political science. I don't know, but I suspect it's not much different in engineering—just awful, despite the efforts made here and there, and there have been efforts. In the end, leadership has made a big difference. But there are still the structural problems, the decentralization, the extent to which these problems really come down to the tenured faculty in each of their domains and the difficulty of breaking through that if you don't have somebody willing to fight. That's one of the reasons why you need to have blacks in here, but you need to have good people.

If we're talking about fighting for tenured appointment and recruiting, it's the same thing on the admissions committees. The admissions committee in our department has been the easiest part because you almost always have some willingness to kind of stretch things and leave some room.

But then where we see the problem at the other end is, are we really able to teach—not just willing, able, to teach across a range of backgrounds and interests? The mentoring problems come to be more and more resented. People say we're spending all our time working with people who shouldn't be here.

By the way, this is not all about blacks. You can name the blacks because there are only two or three blacks. There is this sense that somehow or another we need to have a whole range of people. In the admissions committee I fight for people with real-world experience. I want to see folks who come in here who know what it is to hurt. The fact that they have scores at the 99th percentile on the GRE is not enough. We dip down into the upper 80's, in the end, for a lot of people because they've done some interesting work and have an approach to things that's mature, and so forth and so on. We've turned down some folks with 98th percentile GRE's because we on the committee were willing to stay an extra hour or two and do battle over what we really want. We want a mix of capacity with experience, with a sense of how to carry out the applied side of things, how to grapple with matching theory to real-world problems. In the admissions process we have to fight to keep students on the admissions committee because they tend to support that point of view. Those are fights we win. I mean, I look back on it and I'd say, even though we don't have all that many blacks in the department, we do have some diversity and I assume you can see that in other departments.

Then you look at the way in which even the students behave. Racism is there, they run into a problem and they drop you and go get somebody else. Well, if I've got a student in my class, say an advisee or something like that, and they think I'm going to give them a hard time with their work—especially if they're white, okay?—they'll drop you. If they think you're not going to be well positioned to give them the job they want in the white world—and the world is white—they drop you. So actually, it's been an awful experience from time to time dealing with some of the students.

These are graduate students?

It's more on the graduate student level than the undergraduate. But there is another dimension, too. You've got to get people to perceive, to be

willing first of all, to have a black person in authority over them. It's very hard for white Americans and hard for whites elsewhere, less so for other people elsewhere. But for white Americans, it's always a problem. It's not that solvable.

I've had a number of white students. I've had some very good white students who I really put out for, but who in the end went to someone else. And I don't forget it. I mean, I really extended for them. I'm not hostile to them in a sense that I talk to them and on some occasions I've even written letters despite all of that. But if it comes up in any way, if somebody says—"How come this person did work in your area and you weren't the supervisor?"—I say, "At one time I was, and then that person chose to jump ship."

What about your grad students?

I haven't had very many black students at the graduate level, but those with whom I have worked have done pretty well. Georgia Persons and Marsha Coleman are outstanding examples. Some have kind of drifted over to me, even though I did not supervise their dissertation, because they feel a connection there.

They worked on some of the same issues that you were dealing with.

That's right. I worked with Alma Young, but she also had other mentors, and she's great. She's still feeling the loneliness out there, and so are a number of them. Walter Hill is another example. But what pains me is the difficulty, the sort of hypocrisy in a lot of white students who will talk to you in the hallways and tell you that they're interested in your course and then never take it.

And you recognize that, too.

Oh yes, of course. So we have a long way to go in building the framework. Students aren't going to be high risk takers and in a way I can't blame them. If they come through and they perceive that because somehow or another this person is marginal in the department, they're marginal in the profession. Now why are they marginal in the department? Because they keep fighting for stuff they lose on. So you've got a certain tenseness there.

Now maybe there's respect, sometimes you don't know. I mean, even in the adversary there may be respect. The general kind of tenor that develops in all of this is, "Here you are over here

in this corner always fighting, usually fighting,” and it must affect students’ sense of who you’re working with. One answer to that would be not to have any blacks around and then they wouldn’t have that problem—or, get a bunch more and then all the fighting won’t fall on one and in a certain sense people would take it more as normal, as a more normal part of their existence. Under those circumstances, you’d better have a sense of why you’re in this. If you’re in it in order simply to be the academic gamesman, you’re probably going to lose or you’re doing a “Tom” to your heart.

I think that is really a very important comment for young folks to hear from somebody who spent thirty-five years in a major institution like MIT.

I don’t think you can say I Tommed.

Oh, absolutely not. That’s why I think you need to say that. It has a lot to do with the way you came in terms of your activism, I think. Somehow or another I keep connecting what you’re saying with a chosen way or path that you’ve taken.

Yes, I don’t resist the notion of choice if I reflect back on it and say, “Are you rational? Are you aware of the costs and benefits of doing this?” But it’s not chosen from the point of view that I have had any choice about it. That is to say, I would not be a professor at this or any other institution if I could not really work on the problems that matter.

To MIT’s credit, I’ve been here thirty years, I did get tenure, I have had resources put in my hands time and time again. I’ve won some battles. I get wearied by having to keep fighting them, but this has not been a place that’s beat me down, even with all of that. But, denying a tenure offer to Richard Joseph is inexcusable and not really subject to rational explanation. The *best* face I can put on that is racial discrimination. Here is a Rhodes Scholar with two major books, a third quite notable one, and many, many stellar chapters and articles. He has the experience of developing and running a significant project of the Ford Foundation regarding human rights in West Africa, and he has conducted a very significant program at the Carter Center in Atlanta. He played a major role in designing and monitoring the first really open and democratic election in recent times in Africa, that led to the first instance of the replacement by election of an African head of state. And this was not enough to warrant tenure?

That is the major reason I took early retirement. I hope younger people will see the need and have the courage and energy to continue this fight. This need will continue for some time. I hope they will not be destroyed in the process, or deflected from combining scholarship with activism. We, and the country, still need that combination.

By and large, I can say I’ve got a bunch of friends around. They’re not close friends, but I don’t walk along with a cloud over my head and people don’t jump to the other side of the street or something, take a different alley, down the hallway or whatever. So I don’t put it so much as choice. I used to say it is an orientation to the work that fundamentally is outward-looking. That doesn’t mean I go out, that I’m not here, that I don’t hang around here. I’m here a lot, or at home, but I’m not here in terms of this being the center of my gravity, so to speak. My commitment is not primarily to build MIT. In building what I do build, I have helped build MIT. I think we’ve talked about this to others.

One of the nice things about MIT as a group of engineers, at least, and maybe even scientists, is their appreciation of trying to make these things fit *out there* to solve problems. There’s tolerance for that, really. And at certain points in time, I was cavalier about it. I said, “Well, Bob Wood can go off and serve the government, I’m going to go serve the people. I’ll take my two years and go to the community and that’s equivalent.” That was in no wise equivalent.

That was your thinking, though.

Well, in a sense, but I think it is the same elsewhere. If you look around the country at most black academics who really have anything, it’s just nice to see somebody like Skip Gates or Cornel West do it with such verve and style and resources. I must say that we have got to give Skip credit because he has put together some stuff and it does serve. I don’t think Skip would have made it on the basis of his contribution to the theoretical formulations alone. He is stylish in terms of how he discusses things, but if he weren’t such a factor in the world then he wouldn’t be at Harvard. He wouldn’t have been because of his standard in the theoretical world. And the same for Cornel. Did they choose to go out and change the world and then tell Harvard, “Okay?” I don’t think so, I think

it's in their nature that they're concerned about working on these problems and bringing the two together. They've insisted that wherever they go they be allowed to do that, they're given the resources to do that, and they've just been able to be prolific and stylish enough in doing it so people in the end say they'd rather have them around and give them the credit on both sides of the fence than not.

But it must take a toll. Certainly it's taken a toll with me. It robs the psyche a lot of times because you would like to just be able to get the resources and go apply them to these problems. Just to try, somehow or another, to be what they might expect you to be would mean pursuing a constantly moving goalpost. It would not be very much concerned with really solving problems out here. And it's not like that at MIT. The great institutions come to grips with that. I don't imagine there is a single black scholar—well, very few—who is really visible and who does not feel these tensions.

Describe the tensions again.

Of feeling that your commitment to making a difference will be undervalued. You want your use of the theoretical frameworks, the generation of the theoretical material, to be judged by you for its practicality, not from its disciplinary impact and its acceptance and the number of citations and its ability somehow or another to connect with the scholarly world.

Somebody who has connected well with this sort of established American social science community would be Thomas Sowell. Thomas Sowell has made a real contribution in the area of "ethnic adaptation" and "migrant success." Maybe he's even contributed to the theory, but so often it seems that he is almost gratuitously giving ammunition to the enemy—the Tom factor, you know. He has made much more sound contributions to actual discourse around the issues than, say, a Clarence Thomas, but they're something of the same kind of caliber. They're being used. At various times people around here, prominent people in the Boston area, have served the purposes of their institutions in unbecoming ways, even though you could say—and I'm thinking not of this institution, but other institutions in the Boston area—it's a shame because we really had real achievers. But it just seemed that somehow or

another the political agenda of white America and even conservative white America took over.

I don't want to be more explicit than that, but I think the tension is always between an academic establishment that is fundamentally, if not hostile to, at least distant from, poor people, people of color. It is an establishment. The academies, the journals, the foundations, the fellowships, the sources of fellowship money, the sources of research funding, and the major prestigious university institutions and research centers and so forth are in that establishment. Fundamentally, we are not. We only have a foot in the door here and there. So if somebody comes along and really wants to be a mover and shaker in that world, they often have a high price to pay.

I think some people have been able to succeed without doing that. I look at Ruth Simmons. She is the president now of Smith College. I don't perceive that she has bent to be prominent and influential and respected. At least she must have been respected, but in the end I don't know that it's academia that made her president. I think there's a corporate as well as a certain academic element to it.

I heard it was something like a Bob Wood.

Is that right? Who really engineered that? But the point is that one of the nice things is that here's a person of integrity who has really been there—major white institution of the white establishment. In a way you can say that a Johnetta Cole does not represent the same phenomenon. She is a real mover and a real shaker, but she wound up at black institutions in order to do that. I don't think they would have made a Johnetta Cole the president of any major institution. I don't know how much respect Bob Keith gets or not. I don't know that John Turner is going to be able to emerge in a comparable position in a smallish but well-established white college. I thought he left Knoxville College years ago.

I think a few years ago.

Well, the corporate world is a way to come back, too, in a certain sense. I don't know that Chris Wharton, the head of TIAA/CREF, had been much of an academic. I mean, certain people have been able to do things. None of them are known as theoreticians. All of them have some kind of combination of being able to organize and deal with the corporate world. So it's tough. I don't

know what advice to give to young people who are looking to an academic career.

Did you know Ron Brown very well?

No.

Did you know his background at all?

Well, just by reading. I met him. I had a lot of respect for the role he was able to play. As a businessman, I don't know that I would hold him up as a real model, but I don't know. You just assume there was a lot of stuff going on, so many things going on, but he was still a fine person, it seems.

I was just dealing more with an academic side of things, somebody coming up really aware of their professional academic role. This is not for all students. I tell it at the graduate student level where the issue of career choice becomes sort of the corporate or governmental world out there versus academia. To make it in academia poses the special set of problems that I've been talking about. They may be comparable in the corporate world; I don't know that world. I don't even know what it's like on the staff side of academia, but I can imagine. But it does seem to me to be easier for staff than for academics.

You're talking about your long history here. It's very depressing, frankly, to hear you talk honestly about what you would say to, say, a young Clarence, or your daughter who wanted to come into academia.

I would say that the fundamental motivation has to be to solve real problems that are important to you. Academic institutions, in many instances, will offer you a chance to do that. It offered me a chance to do that and I've done that—not without some psychic costs, and not without a whole lot of luck. But I wouldn't go into an academic career with the expectation of big-time. I mean, really bright people ought to aim for big-time stuff, unless the fundamental motivation is just to think about problems—you know, they're fascinating and somehow or another you like teaching; go to a teaching-oriented school to do that. That's a different thing, that's teaching.

But I meant research academia. Here I think you fundamentally have to be driven by the interest in the problems and then you just have to push and fight for the opportunity to address those problems. We have to, we who are established, create this space for people to do that, and it is a constant battle. It's an obligation. You've got to go be

on these review committees, in the journals, you've got to go be on the award-giving committees for the foundations and the fellowships, because otherwise they're not going to be here. People who come along with the kind of interest we have are going somehow or another to be marginalized. The institution's going to say, "Oh, well, we're not so sure that the theoretical range for this one will really travel very well to other problems, is well-grounded, et cetera. Is this really feasible? When this is done, will the person have a basis for solving other, similar problems?" All this is just different ways of saying "parochial," "limited," "not us"—the rest of the world saying, "Okay, you solved the problems for this one, but that doesn't mean anything for anybody else."

So double duty, you've got to go be on these committees. Anybody here at MIT would probably say that. It's your civic responsibility, professional citizenship, and so on. You've got to do all that, but we've got to go the extra mile because when you go there, it's not just being willing to read a bunch of folders, it means that you have got to fight for somebody who's fighting for something. It means that it's going to take stuff out of you when you do it. You go there and it's not going to be an emotionally placid, level operation. You're going to find yourself fighting with your good liberal friends again in the SSRC, in the whatever.

So you're always by yourself, fighting.

It's for you to decide whether that's just a personality trait. There are some people like that and they're just cantankerous, versus this being a real dimension of the situation. All I can say is, my perception of it is that whenever you look into those matters, even if things are going right, you're going to meet with at least one case where a person who ought to have a hearing is not getting it. And it will fall on you to make space for that hearing. That's going to make you come back tense, uptight, and angry.

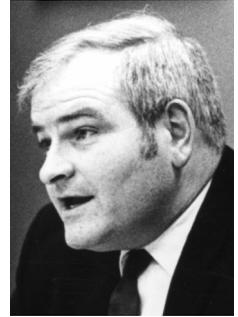

It's good to have Vivian at home, isn't it?

Well, she asked me the same thing. She has to fight, too. Oh my goodness, and we would look at each other and we'd say, "We've been at this thing for so long, we shouldn't have to be doing this." Then, of course, sometimes you find that it comes back in your face because you have to fight for

some folks who can't really do it. You made a mistake and you just have to have the maturity to say you will make mistakes. Here you try hard for a black person to get in there and they really should not be. Well, that happened to whites as well! It's a step back to maturity to say, "Well, that's true. Maybe one or two of my candidates shouldn't have been here."

PAUL E. GRAY

b. 1932, SB 1954, SM 1955, ScD 1960 (electrical engineering) MIT; joined the MIT faculty in 1960; professor of electrical engineering, 1967– ; dean, School of Engineering, 1970-1971; chancellor, 1971-1980; president, 1980-1990; chair, MIT Corporation, 1990-1997; returned to the faculty as professor of electrical engineering in 1997; chair, Task Force on Educational Opportunity, 1968-1973; member, National Academy of Engineering, elected 1975; member, Committee on Minorities in Engineering, Assembly of Engineering, National Research Council, 1974-1979.

I was born in Newark, New Jersey. My mother and father lived on Second Street in Newark. I was born in the Women's and Children's Hospital in Newark, which I think no longer exists as such. I lived in Newark until I was about two. I have no memories, really, of anything of those years in Newark.

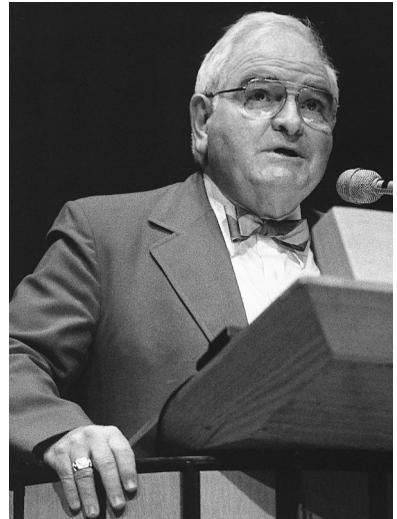

When I was somewhere between two and three, my family moved to East Orange, New Jersey, a little west of Newark. We lived at 369 North Grove Street in East Orange until I was about ten. That's where I started school, at an East Orange public elementary school which was just down at the corner of Grove Street and Springdale Avenue in East Orange. I went there, it must have been through about fourth grade—or part way in the fifth grade, I guess, because we moved in the middle of the year. When I was about ten, my family moved from East Orange to Livingston, New Jersey, which was a little farther west—twelve or thirteen miles from Newark. That's where I lived until I came away to college. My mother lived there until eighteen months ago, when she had to go to a nursing home.

After moving to Livingston, I went to public schools there. I finished elementary school at the Roosevelt School in Livingston and then went to junior high school two years there. Livingston, New Jersey, now is a New York bedroom community, about forty thousand people. When we moved there in 1942, it was a town of less than three thousand people. It was a farming community, truck farming mostly. The town did not have enough population to sustain a high school. We traveled by

bus about eight miles each day to Caldwell, New Jersey. I went to high school there in what was then called the Grover Cleveland High School in Caldwell. I graduated from the Caldwell high school in 1950. Those were my educational settings in the years before I came here. I came here in September 1950 as a freshman.

What about any interracial contacts during that period of time? Could you reflect on your earliest memories of contact with blacks, or any evolution of your own views in that regard?

I believe that I never had a personal contact with a black person—man, woman, or child—through my graduation from high school. East Orange now is a heavily black community; it was not in the 1930s. I don't believe there were any black folks who lived in Livingston, and there were none in my class at Caldwell. I'm trying to think of other

Edited and excerpted from oral history interviews conducted by Clarence G. Williams with Paul E. Gray in Cambridge, Massachusetts, 23 May and 12 July 1996.

settings in which I might have encountered black folks, but I don't believe there were any. I don't think I encountered black folks probably until I got involved in the Reserve Officers Training Corps (ROTC) here and went off to ROTC summer camp, when I was nineteen or twenty years old.

Do you recall any highlight in that period, when you first encountered black people in ROTC training?

No. If you generalize the question and say, when did I first have ongoing relationships with black folks in a professional sense—or in any sense, a social sense—it was not until I was involved here as a graduate student and faculty member in the late '50s, early '60s.

How did you decide to come to MIT as an undergraduate student?

I've got to tell you something about my family for you to understand that. I was an only child. I was a child of the Depression, born in 1932. My mother is a high-school graduate and had worked as a secretary for a while. My father never went to high school. He left school in World War I to go to work. He spent most of his life working in a public utility, Public Service Electric and Gas, which is the utility that supplies most of northern New Jersey. It's a company where Shirley Jackson later served on the board. He started working for Public Service as an electrician, and soon became what was known at that time as a "load dispatcher."

Now, any utility at that time had to have a set of people at work twenty-four hours a day. It was a shift job. The function of those folks was to buy power or sell power, but to do it in such a way that supply and demand matched. They had to anticipate how the demand was going to shift over the day, whether it was winter or summer, and if they had excess generating capacity they arranged to sell power to other parts of the Northeast that needed it. If they had insufficient capacity, they bought power. So, it was a job which at that time took people who had reasonable knowledge of the system and reasonable judgment to do this task manually, essentially, by telephone interaction with parts of the company and with other companies in the region. Those jobs have all been replaced. That's done now by computer. It's kind of a well understood, rule-based function which is done entirely automatically.

My father worked in that job until he retired in 1965. In that job, the people he worked for—

the people he learned from, took his direction from, and was accountable to—were all engineers. I think if times had been different, if his life experience had been different, my father probably would have pursued a career in engineering. He liked doing things with his hands. He cultivated that interest in me. As early as I can remember, I fooled around with microscopes and chemical sets and electricity. I made things. I was involved with amateur radio, made all my own gear. But I tell you this story because, from as early as I can remember, his view of what I ought to do with my life was be an engineer. Engineers were from his perspective sort of the next step up the social ladder. They were the people he worked for.

I can remember—probably at about age twelve to fourteen, before I was in high school certainly—we took a trip. My mother and father and my grandmother, who lived with us, and I—four of us—went in a 1936 Plymouth. This must have been right at the end of the World War II because it was after gas rationing had ended. I was probably thirteen or fourteen. We took a trip up through New England. We started out and came up the New York border and Vermont and New Hampshire and the White Mountains and over the coast of Maine and down. We stopped in Cambridge to see MIT. We didn't go into the buildings, but we drove by. There were trolley cars coming across the bridge at that time. My father had talked with engineers whom he knew and respected in the company about where a youngster should go if he wants the best engineering education. Everybody said, "Go to MIT." So that was sort of fixed in my head before I ever got to high school. As I say, we didn't stop here—we just drove across the bridge, drove around the place, and left.

When it came time to apply to colleges, I applied to four. I applied to MIT and Yale. Yale at that time had the Sheffield School of Engineering, and substantial engineering activity. I applied to Rensselaer Polytechnic Institute and I applied to Cooper Union, which was in New York City, a lower Manhattan school. I was admitted to all four of those. I applied for financial aid at all of them. The choice for me narrowed down rather quickly to MIT, Yale, and RPI. Both Yale and RPI had offered me quite a lot of financial aid, and MIT had not. I was about to make the decision to go to Yale. My high-school English teacher said to me,

in effect, “You’d be a fool to go anywhere except MIT, so turn the others down and go to MIT.” She was an enormous influence on my life, just in terms of what she taught me. I had her for four years in high school. She taught all four years of English. I was in the college prep track and I had the good fortune to have her all four years. My parents and I ruminated over her advice about MIT and, in the end, this is where I accepted. It was a fortunate choice. Had I gone to Yale, it was only a few years later—mid-fifties—that Yale abandoned engineering and closed down the Sheffield School. This was and is a better place than RPI to get an education.

So, how did I get here? It was a combination of influence from my father, influence in two senses—one, he cultivated in me what I suppose was a natural interest in doing things with my hands, in doing things particularly that were electrical in nature; and also the direct influence of him being convinced that this was the place to go. It was also Mrs. Morford, Emily Morford, the high-school English teacher, who really pushed me over the edge when it came time to make a decision to come. I stayed in touch with her. She lived to be ninety-seven years old. She retired to Florida. She died only two or three years ago. She saw me be elected president of MIT. She wasn’t here, but we communicated. My last conversation with her on the telephone was about two weeks before she died. She was not in her right mind at that point, but we had stayed in touch. She was important to me. There were other people in school—the physics teacher, a math teacher, all were important people—but she was the one who had in a way the greatest influence on my career in high school. I suppose all of us have had the experience of having in our lives one or two or three teachers who have made all the difference. She was the one who made the difference before I came to MIT.

There was one man here at MIT who made the difference for me in my experiences here. That was Tom Jones. He came back here to be vice president after he retired as president of the University of South Carolina.

He was in Course VI?

Yes. When I was an undergraduate, Tom was teaching the sophomore course in electrical engineering. That’s when I got acquainted with him. He

soon, part way through that sophomore year, offered me a job. I needed the work while I was here during the year. I did a variety of things. I worked stacking books in the engineering library up under the Dome. I worked washing dishes at the Phi Sigma Kappa fraternity house. Tom recruited me to calibrate instruments in the Instrumentation Laboratory. I did that for two or three years. I ended up doing a bachelor’s thesis for him, and the next year doing a master’s thesis for him.

When I finished the master’s thesis, I never wanted to see this place again. I had had it right up to here, a little higher. I had been a full-time student for five years and I was fed up with it. I had my commission (I had been commissioned in ROTC), I was married after my master’s degree that summer, and we were going off to be in the Army. As I left, as I prepared to leave, Tom said, “Why don’t we appoint you teaching assistant in EE? You can take a leave of absence and go off and serve your time for Uncle Sam, and then come back and take some more education.” And I wasn’t having it at all. I had had enough. So I turned that down and went away. After a year and a half in the Army, I kind of mellowed a little about MIT and came back to see Tom. He was still teaching in electrical engineering. He offered me the teaching assistant position that I had refused two years earlier. That’s how I came back here, and I haven’t left since.

I have to say more about my father. I’ve told you how he was convinced that this was where I ought to go to learn to be an electrical engineer. But the other part of his dream for me was that I would get my degree in engineering and go to work in industry. I suppose he assumed I would go to work for Public Service Electric and Gas—which of course I never did, never had any interest in doing. I was not interested in the electric utility industry. He understood and supported me in the emotional sense. At that time I was financially independent, but he supported me in coming back to graduate school to get a doctorate. Education was something he respected. But at the end of that three years of graduate study, when I got my doctorate, I knew then that what I wanted to do was stay here as a faculty member. I knew that the thing that gave me the most satisfaction was the involvement with students and teaching. From the time I told him that it was my intention to take a faculty appointment as assistant professor

and stay here, he was ever more dissatisfied. He was really bitterly disappointed, so disappointed and so expressive of his disappointment that for the last ten or fifteen years of his life—he only lived to 1971, he died of cancer quite early—that last eleven years after I accepted the appointment here until his death, we were never quite reconciled on it. That's how strongly he felt about it. It was, in his mind, a mistake. Now, he lived long enough to know that I was elected to be chancellor of the Institute in 1971, spring of '71. He died in the fall of '71, about a week after my inauguration as chancellor. He lived long enough to know that, but that didn't matter to him. I was still in the wrong place. I should have taken all that education and gone out to do something useful, in his view. It ended up being a sad time for me because the relationship was never the same after.

You asked me what my first experiences were with blacks. I really ought to say that my father—and you have to understand this in terms of the generation, he was born in 1900—was a dyed-in-the-wool bigot when it came to anyone different from him. Now, he didn't pick particularly on black folks, but on anybody who wasn't like him—who wasn't white and Protestant. I grew up with that. My wife grew up in really the same sort of circumstances. Priscilla grew up in a family where there was a good deal of intolerance and bigotry expressed. That, I think, was to some degree a generational thing.

What is interesting about what I know and have read about you—and I'm trying to get some sense of it—is that your efforts in this whole arena, in working to help blacks to be what they can be, at least here, and where you've spent your whole life, is extraordinary. I'm trying to see where all that came from. If you say you didn't get a lot of experience in your early educational process and early life, how can you be so different from so many people who happen to be white whom I know? That's what I'm struggling with, to try to see if you can give us any insight on that.

I don't know. I haven't in my own life been introspective about that in the way you're asking me now to be. Certainly some of it was the sense when you're a student here—when you're an undergraduate student here, or a graduate student here—that your world is very small. I mean, at that time in the undergraduate program here it was really lock-step. Everybody, all nine hundred of us,

took exactly the same freshman year, exactly the same. When you got your stuff from the Institute in the summer before you arrived, there was a listing which showed what section you were in by alphabet. You went to all your classes with that same set of twenty-five or thirty people. You went to lectures with them, went to all the recitations with them, you did everything with them.

That's quite different from the way it is now.

Oh yes, enormously different. Now, the upper-class years weren't quite that rigid. Sophomore year was still pretty tied down. You were in a department now. I was in electrical engineering, but you had your choice of communications or electronics or power—those were the three options—and once you decided on an option you took your classes with the same set of folks. Of course, as a graduate student where you're principally doing research, you're in a laboratory with a half dozen other graduate students—or a dozen—and a couple of faculty members, and that's what your focus is.

That's what I meant by saying that as a student here your world was very small. You kind of had two worlds. You had the world of the people you went to class with, same set of folks, and then you had the world of the people where you lived. Through that time—really through the decade of the 1950s, with two years taken out to be in the Army, when I did not have much contact with blacks or other minorities—all my time here at MIT was pretty isolated. It wasn't until I came back as a faculty member in effect, until I finished school—I joined the faculty in 1960—that I began to have a larger view of MIT.

I think there were perhaps two experiences in the early '60s that influenced me in my perceptions and views on the questions you're asking. One was the realization, as I got to be involved in 1962, maybe, as chairman of the Freshman Advisory Council, that we had more blacks here from Africa than we had from the United States in those years. And that just didn't seem right. The other experience was a more personal one. It was in connection with the fraternity in which I lived. That was a national fraternity. It had a chapter at Boston University. Somewhere in that period, early 1960s, when I was chapter advisor here—I was the faculty member who was for a couple of years advisor to the local chapter—the chapter at

Boston University decided it was going to initiate a black man. You'd have thought it was the end of the world, as far as the national was concerned. They came down hard on the Boston University chapter. They disenfranchised them. Other chapters in the area got involved, in the sense of expressing views on it. I didn't know anybody at the BU chapter, I didn't know the person they were planning on initiating, but that whole reaction from these elderly men who were running the fraternity down in Bucks County, Pennsylvania, seemed to me really grossly unfair and unreasonable. My view on national fraternities has been different ever since. That had an effect, I think.

Those are the only two experiences that I can cite that I think perhaps left me in a state of mind that was receptive to the task that Howard Johnson gave me in 1968.

I want to get to that point because I remember that being a pivotal assignment—leadership of the Task Force on Educational Opportunity. But before we get to that, is there anything else you can think about in your undergraduate experience? Were there blacks around during your undergraduate education? Was there any kind of contact, relationship, or any event that you can think of that occurred during that time?

There were undoubtedly blacks in the class of 1954, but there was never one in any of my classes.

Were there any women?

There was one woman, Jane—she wasn't Dennis then. She married Jack Dennis, a faculty member who retired a few years ago. She was a faculty member at the University of Massachusetts at Lowell. I've forgotten what her maiden name was, but Jane was in most of my classes through those years. She was the only woman I encountered in my undergraduate years here. As a graduate student, she worked in the same lab I worked in. So I didn't have any personal contact, either where I lived or where I went to school, through those years with blacks.

Talk a little bit about that first assignment. Why did Howard give it to you?

Well, I think I understand the answer to that question. Let me say first that the event that changed the world at MIT—forever changed MIT—was Martin Luther King, Jr.'s assassination in April 1968. I was not here at that time. We, the whole

family, were in north Wales at the University College of North Wales, where I was on sabbatical leave—the only sabbatical I've ever had. We had gone in the winter of '67-'68 and planned to return in September of 1968. In fact, we were traveling around continental Europe by car in the latter part of March and the month of April, just so the kids could see something of Europe. We were in St. Peter's Square on the morning after King was assassinated. The first we knew of it was when I saw a newsstand, just outside the Square, and I knew enough Italian that I could read the headline. That was the first we heard of it.

I've got to back up. Ken Wadleigh asked me if I would be the faculty member who chaired the Freshman Advisory Council—'62 or '63—which I agreed to do. A couple of years later, in 1965, he asked me if I would come to work for him half-time as associate dean of student affairs to continue doing in a way what I was doing with the Freshman Advisory Council, but also to help implement what was in 1965 a new undergraduate curriculum. There was a committee called the CCCP, the Committee on Curriculum Content Planning, which was chaired by Jerrold Zacharias. The Committee worked through '63 and '64 to rethink the undergraduate curriculum. Its recommendations were adopted by the faculty in the '64-'65 year. You've probably seen the report. It was an 8½" by 11" document with a big red cover. It just had the initials CCCP—which of course were the initials for the Soviet Union—in Russian, it's CCCP. A bit of a joke on Zach's part.

The report was adopted, and there were going to be big changes in the freshman year. Ken asked me if I would come to work for him half time to help implement those changes, which I did. I worked for Ken as associate dean for a couple of years doing this. During that time, Jerry Wiesner came back from Washington and was appointed dean of science. Then, when Howard became president in the summer of 1966, Jerry became provost. In the summer of 1967, Jerry asked me if I would come to work in his office doing the same sort of things—undergraduate program—as the assistant provost. There were three people in the Provost's Office. It was Jerry as provost, Rosenblith as associate provost, and I was assistant provost.

I did that through part of 1967. Then in that winter, we went off on sabbatical leave. While we

were away, after the assassination, the Black Students Union got created. Shirley Jackson and Jim Turner created the BSU, twenty-something people—I think that’s right. Jim Turner got a Ph.D. in physics. Those two folks—Shirley and Jim—brought together the quite small number of American blacks at MIT at that point. Shirley had graduated that year, she was class of ’68 as an undergraduate. They organized the BSU. Early in September, when the school year started, the BSU sent to Howard—this must be on the record—a list of ... I was about to say demands, but I don’t think they phrased it that way, I think they phrased it as “requests,” a dozen or so. They had to do with what you would expect. They had to do with increasing the number of blacks admitted, student aid, and support—those items.

I came back from Wales in the first two weeks in September. I was here for registration day. About the same time, Howard got this request from the BSU—this list of items that they wanted addressed. My belief has always been that Howard looked around and said, “Who can I tag to work on this problem?” And I was just back—with my batteries charged, presumably. He said, “Gray, do this. Would you please take this on?” That led to the formation of what was called the Task Force on Educational Opportunity, which I chaired for several years. Shirley and Jim, John Mims, eventually Jim Bishop, Jim Turner, were all members.

And it sort of went from there. That’s how it got started. Why was it me? It was because I was back, I had had eight months away to finish the task I was working on, which was finishing that book that I wrote with Camp Searle, an undergraduate electronics textbook. That was done, Howard knew it was done, and I was somebody in the Provost’s Office whom he could tag to try and work on this.

There are a couple of things I want to get your impression of before 1968, but this task force is a major piece, even in terms of what we’re doing today. Can you talk a little bit about your role and reflect a little on the nature of your close relationship with people who were involved in that task force—students, faculty, and administrators? Could you talk about the major undertaking to get the institution to do a lot of the things that you were confronted with by students from 1968 to 1972?

During those early years, by which I mean September of ’68 through probably 1971, this was

an extremely intense activity. For a while in that fall we were meeting more than once a week. The task force was meeting more than once a week. It would meet for several hours each time. You’ve got to remember that the task force was not terribly well defined in terms of who ought to be involved. It was picked up; I kind of pulled it together. It had people on it like Ken Wadleigh and Jack Frailey and the director of admissions, who must have been either Greeley or Richardson at that point.

Other people who were interested in this issue sort of got collected in, got drawn in. Harold Isaacs was one of them. He was professor of political science. He had been a newspaper man, he had been a journalist much of his life. He had written a lot about relations between the races—not so much about America, although he had written books about American black and white relations, but he had written about India and about China and other parts of the world. He died about ten years ago. Harold got involved because he was interested in these questions, professionally interested. Students got drawn in on the basis of their interest and their ability to put time into it. Shirley and Jim Turner were there, of course, but there were other students who were involved in that first year. I can’t name any of them at this point, but it stands on the record and we can look it up. There are others who were involved.

And it was very intense. We sort of lived it all the time, even when we weren’t in a meeting, because the issues we were dealing with were so fundamental in a way to the institution. The institution was being asked to change significantly. The task of the task force, in a way, was to figure out how we could make changes as rapidly as possible without breaking anything, without having a revolution. There were plenty of folks who thought we ought not do this.

There were some marvelous misunderstandings that went on for weeks and weeks. I’ll give you an example—the one that sticks in my mind, the most outstanding. The students said, in this list that they presented the president, that black students admitted to MIT should receive ... and they used a phrase something like “full financial support.” We at that point had been for three or four years on need-based aid. MIT wasn’t always on need-based aid, but, beginning about 1965, all aid was awarded on the basis of need. Just as it is now,

every needy student gets the first X dollars in loan or work time, and the rest of it is grant. X at that point was twelve hundred dollars. But one of those requests put forward by the students was “full financial support.” What Wadleigh and Frailey and Richardson—or Greeley, whoever it was—and I thought that meant was financial support up to total cost, full financial support, that is, that these students would receive their entire cost of MIT, a standard student budget from the Institute.

We found that to be not just problematic but unacceptable. It turned out that what the students meant by that was that whatever the need was ought to be fully met in the form of a scholarship. They still wanted it need-based. There’s a standard student budget—what it costs a student to spend a year at MIT. It’s thirty thousand dollars now. At that time, it must have been—I don’t know—five or six thousand dollars, something in that range. The aid practice at that time was that a student applied for aid, you looked at the family situation, and you said, for example, “This family can contribute a thousand dollars to this student’s education and the total standard student budget is five thousand dollars, therefore that student has a need of four thousand dollars.” The first twelve hundred dollars would come in the form of loan and the remaining twenty-eight hundred dollars would be in the form of scholarship. That was the policy we were operating under. When students said “We want full financial support,” all of the staff and faculty in the room thought they meant “We want five thousand dollars a year for each student, we want enough to meet the standard student budget.” What they meant was, “We want enough to meet the student’s need and it should all be scholarship, no loan.” A very different meaning.

You’ll find this hard to believe, but we fought over that for two or three months until finally—like the light coming on, like a revelation from God—it was suddenly clear we were talking about two different things. Once that misunderstanding got shoved aside, we had no disagreement. It seems impossible that this set of people could meet together for that long and not understand they were talking about different things, but that was what happened.

Do you have any sense of how you came to grips with the fact that you were talking about two different things?

I don’t know how we got to that point, but the result of that was that we created an aid policy for minorities. Then we were talking just about black students, that defined minority. That got widened, as you well know, to include Hispanics and Native Americans rather quickly. But the result was we defined an aid policy which said black students admitted to MIT will receive aid up to their need, and it was going to be all in the form of scholarship. That got changed then in the next few years, so that there was a self-help level which was less than the self-help level for everyone else. Eventually, some time around the middle 1970s, that aspect of the policy got eliminated.

But that’s the example that stands out in my mind of how a set of folks can sit around a table for a couple of months, think they understand each other, and be talking about two very different things. These meetings, the early meetings of the task force were, as I said, intense. They were tense as well, but they were seldom confrontational.

You did not feel that students were confronting you.

No, maybe I used the wrong word. I mean, they were confrontational in the sense that here were a set of students pressing their agenda that was requiring the place to change—and that was, in a sense, a confrontation. But the meetings were not shouting matches, ever. They were not mean-spirited or angry in the sense of people shouting at each other. This was a great blessing because we were dealing with hard problems. If we had begun to dislike each other, or take offense at each other, it would have gone awry. There was only one member of the task force in those early years who insisted on making it confrontational. He would get up and storm out of the meeting angrily. One of those times he called me a phrase I’ll not repeat, storming out of the meeting. That was the only person involved in that whole process who really wanted to make this a fight.

So did you sense that there was a white-black issue in any of these confrontations? Again, that may have been the most intense situation that you had actually been in. Yes, it certainly was.

Or, in fact, that any white professor at the Institute would have been in during this early period after Martin Luther King was killed and particularly after you began to look at what things were being done here.

Yes. I think there was only one other time in my life when I was in a situation where there was as much intensity and tension. That was when I was in the Army, when I served for a year, I guess. You know, when you're an officer in the Army—if you're a junior officer in the Army—you get all kinds of assignments in addition to your principal duties. You get to be supply officer, you get to be top-secret control officer. I was assigned for a period to be the officer who represented the Army in summary court martials. These were usually dealing with relatively minor offenses involving enlisted men—you know, somebody went AWOL for a week or did some other thing which was regarded as a minor offense, what we would call, I guess, a misdemeanor in our legal system. I was assigned the task of making the case for the Army—that is, I was like the prosecutor, if you will. These were trials that were held before a panel of judges. There was another officer who was assigned to be the representative of the accused. So you'd have to go interview somebody. Often you had to interview them at the stockade, the jail. Then they'd show up in front of the court at some point and there would be a trial, following rules not unlike the rules that apply in civil court. There was a manual called *The Uniform Code of Military Justice* which you had to be familiar with, rules of evidence, and all that. But they were tense situations, emotion-loaded situations, because for the young man involved—there weren't any women in the Army at that point—this was a serious business. He was going to get court-martialled and probably dishonorably discharged. He might be going to spend some time in jail.

Except for that experience, I had never had any other experience in my life of hard conflict of ideas and trying to get results. But you know, it was interesting. I would never have characterized the task force in those early years—any time, but certainly in the early years when it was so intense—as black or white, black versus white, or black against white. It wasn't that way. There was a spirit throughout it, I think, of "How can we together make this place change?" And that's kind of the way it evolved. I made a report to the faculty about the work of the task force. I made a number of reports in that first year. I reported to the Corporation and the Corporation Executive Committee. I reported to the faculty in April of 1969. That was the faculty meeting at which the

recommendations of the task force were presented and really accepted. The place began to change at that meeting. It was those things that evolved in that first six or eight months that led to the admission of forty-two blacks, I think, in the fall of 1969.

The largest class of black students ever to have been admitted to MIT at that time.

Yes. There had been about a dozen, eight or nine, the previous year. Fred Douglass Johnson was in that first group.

In that first year or two of that task force, there had to be a lot of things that you may not quite have understood either from the black students' views or from those of some of the administrators. Where did you go to try to get understanding of things when you misunderstood or felt puzzled? You know, I can just see you being puzzled about some things. How did you deal with that?

I talked to people, talked to a lot of people who had more understanding of these issues than I did. I talked a lot to Harold Isaacs, this fellow I mentioned who was a professor of political science. I talked to Frank Jones, I talked to Willard Johnson. I didn't know Jim Williams at that point. I don't think Jim was here. No, he wasn't here in '68. But Willard and Frank and Harold were people I talked with a lot. And I read a lot. Frank gave me a copy of *Souls of Black Folk*. I bought a lot of books. I read a lot of Baldwin, I read Ellison. I just tried to get myself educated on this.

When I mention names like Don Palmer, what comes to mind?

When you say Don Palmer, the word that immediately pops into my head is "puzzlement." I never understood Don. Don and I talked a lot, too.

He may have been the first black psychiatrist here.

Yes, he was. Don and I did talk a lot. There was a fellow, professor of physics, who am I trying to think of?

Jim Young?

Jim Young. Jim Young came here first as a visiting scientist, or a visiting professor maybe, and we talked. John Mims came in that same time. John was here in the fall of '68. He was on the task force. He and I talked a lot. I was in a situation where I had to try to learn as quickly as I could enough about the black experience in the United

States that I could be a more engaged and more understanding participant in this process.

Jim Bishop was here too, wasn't he?

Yes, Jim had just finished or was just finishing his graduate studies. I hired Jim in the spring of '68 to create and run the Interphase program.

When you look back now at that period, and you look at the people you conversed with, the readings, and so forth, what helped you the most? Was it people who helped you the most? Was it your reading that helped you get through this very tough period? On a lot of campuses at that time, people were completely split.

Oh yes, we saw it at Harvard, we saw it at Cornell, we saw it at Wesleyan. One of the things we did, a group of the task force members—Ken Wadleigh and Shirley and Jim and I, and I've forgotten who else—two carloads of us went down and spent a day at Wesleyan, talking with folks down there about their experience. I think I would say people helped the most. It was getting to know students in the BSU, getting to know the students who came here that summer in Interphase. I think I knew all of them personally by the end of the summer. You can learn a lot from books, but there's no substitute for getting to know people. That's where the learning comes from. I look back at this time and I say, this is probably the time in my life when for me personally the greatest growth and change and understanding of complicated problems occurred—greater than any other time. I even learned some silly things about running meetings, such as things go better if you feed people—at least at MIT, with MIT students. If you got something for people to eat, it would go better.

I may be wrong, if so correct me, but there was a special relationship that developed between you and Shirley Jackson. Can you talk a little bit about that? She was still a student, but that relationship has grown enormously over the years.

If you had to look back at the BSU in that first year and ask who was the central figure in bringing that group together, in shaping its plans and directions, and in speaking for it, it was Shirley. She was just the most articulate and the most thoughtful, displayed the most sense and good judgment—not to say other people did not, but she stood out for those qualities. I suppose it was natural that if I wanted to bring the group together at an unscheduled time to deal with something, the person I'd

go talk with about it would be Shirley. The person who would bring the students into the conversation was Shirley. She was clearly *primus inter pares*, first among equals, although never formally designated as such. The BSU in those years always worked hard at having co-chairs.

I suppose that's why the relationship developed beginning in 1968, and it just kept going. There were a couple of years there when she was away and I didn't see her at all. Part of the reason I think that the friendship with Shirley redeveloped when she returned to MIT, and began to be involved in MIT activities, was that she and Margaret MacVicar were such good friends. They were ... I was going to say they were classmates, but that isn't right. Margaret was ahead of her. She was '64, Shirley was '68. But they lived together in McCormick and they were close friends, and at that time I was working hand in glove with Margaret on the Undergraduate Research Opportunities Program. So that was a way of staying in touch with Shirley. I was formally the chair of the organization and she was—not formally, but certainly in everyone's mind and in the way that everybody treated her—the chair of the BSU, the leader of the BSU. It was just natural that we developed a close relationship. Shirley and I often disagreed about things, but there was never a question of doubting each other's integrity or having respect for each other. The respect never faltered.

You had to make some decisions about what kind of students could actually make it here during that period of time. You and the task force came up with the idea of trying to increase the number of black students here. You had to make some decisions. Now, you had to decide what we should do in terms of how many students we brought in and what kinds of students we would identify. Could you talk about what kinds of decisions were involved in that, and also when you look back at it, do you think there were some problems with the number of people you brought in who actually did not make it? Was it very painful for the institution to accept this failure?

When we talked, trying to get at the question of how to increase the number of black Americans here, it seemed obvious that there were two things that had to be done. One was we had to make more black youngsters—high-school youngsters—knowledgeable about MIT, interested in MIT, willing to apply to MIT. The other was we had to change the way we dealt with admissions.

You know generally what we did with respect to the first part of that problem. We got from the College Board the list of people who had identified themselves as black and who had scores which were in the range of what would make sense here. We generated materials and mailed to them. A lot of the students who were here in 1968-'69, that small number of black students, went out and did school visiting. That process alone increased the number of black applicants, my guess is, by a factor of between five and ten. The number of applicants just went up enormously. We had a much bigger pool to draw from. But it was also clear that we had to change the way we approached admissions.

Now, I've got to describe what has been my sense of the philosophy on which the admissions process has operated—operated then and operates now. The Institute gets a set of applications, completed applications, which I find it helpful to think of as broadly falling into three categories. There are a relatively small number, a few hundred students, who are obviously admissible. Anybody looking at the record, looking at the individual, would say “in”—and almost any college in the country would say the same thing. There is another set of folks—a larger number, maybe a thousand or so—that it doesn't take you very long to say “that student isn't going to survive here, that student shouldn't be admitted to MIT because they can't cut it.” Just based on their high-school record, you would come to the conclusion that you shouldn't admit them because they aren't going to make it.

Do you have a sense of what that is, in more detail?

Well, it has to do with grades, it has to do with board scores, it has to do with evidence of motivation, of energy, of doing things they aren't required to do—but for some set of folks you wouldn't have any difficulty getting agreement, “don't admit this person.” Then there's the large number—in those years we were getting three or four thousand applicants, now we get eight thousand applicants—the big group in the middle, which is probably three-quarters of the total that are palpably admissible. Some look more so than others, but you could make an argument that those folks ought to be admitted. We can't take them all. We're going to admit about two thousand. We admit all that few hundred that look like they're stars, like they clearly can do MIT. Then you look

at this big group and you say, “Okay, how do we now sort out in this process which one-sixth or one-third of these students—say there are now six thousand of them left—we're going to admit?” It was probably one-half in those years because we had a smaller applicant pool.

You try by this process of looking at personal stuff and academic stuff to admit the best qualified sub-set. That's the process. You admit the best qualified sub-set of the applicant pool. If we now took this larger pool of black applicants and ran them through that same process, we were going to filter a lot of them out because they had come from a different school setting and had had a different life experience—and we weren't so darn sure what best qualified meant there. So we said, “Okay, we're now going to look separately—separate admissions process—for the black applicants, and our task is not to admit the best qualified sub-set but our task is to admit everyone we think can make it at MIT.” That was how we described it. “We're going to admit every applicant who we think has a reasonable chance of making it here.”

Now, we were flying blind at that point. There was always in this group of black applicants a spectrum of preparation. You had some set of students who would have been admitted under the old rules and you had some students who probably shouldn't have applied. But you had a set of students who came from school backgrounds and who had, some of them, board scores that you didn't know what to make of. You didn't know whether they could make it here or not. So we were flying blind, we were taking pot-shots at it, and we did the best we could. We tried to learn from experience. Look at that first group, the class of '73. I don't remember, I knew it at one time, I knew it by heart, but I no longer remember what the graduation rate was. It sure wasn't seventy-five percent. I think we admitted some students at that point who would have been a lot better served if they had gone somewhere else. We ground them down. You found in that group students who just weren't ready to be in college. There are always students in the freshman class who aren't ready to be here, who aren't ready to settle down to serious work. But there were some students who were ready to go to college and ready to tackle this place, and we just couldn't give them the kind of support—or they didn't have the kind of background that made sense. So as time went on—class

of '73, class of '74—we tried to learn from that experience and refine that sense of who can make it here, but still following the same policy of admitting all the students we think can make it.

When you look at, say, two or three years later or even a little longer, we had a chance to do studies. I remember very vividly the young lady down in Admissions who used to look at the admission data and actually put together reports for you to give you some sense about how the students in question were doing at MIT. We began, I think, to make better choices based on those data in terms of the young people who stood a chance of being able to make it here. But it turned out that we couldn't always tell the difference between those who looked like everybody else and those who we thought were at risk, but yet we still were willing to take the chance. Where do you think some of the issues are there?

The conundrum, a problem that selective colleges and universities all wrestle with, is that they are pretty good at predicting success, predicting who will succeed, but they are pretty bad at predicting who will fail. If you ask anybody who is in the statistical side of admissions about that, that's what they'll tell you. It was at that line between success and failure that we were trying to establish thresholds, we were trying to establish understanding. Before the woman in Admissions—a succession of women in Admissions—worked on this, I had a graduate student who worked on it with me: Ken Schoman. Ken was looking at all the data that were available to try and help us discriminate between students who couldn't make it here and students who could. He could predict who was going to be able to breeze through MIT, for the most part. But there were two classes of students that there was just no way to distinguish, there were no discriminators. Those were the students that we thought were going to make it who turned out not to and the students we thought were on the ragged edge who turned out to be stars. I've never been a strong believer in statistics, but that experience strengthened my disbelief. You know the folks around here. Jim Gates was somebody who on the record, when he arrived at MIT, was likely to be hanging on by his fingernails, and he's turned out to be a star. He was evidently a star when he was here.

What about the possible issues related to environment as well?

Yes. Well, when I said we were flying blind, we knew there were environmental differences here but we didn't know how to relate them, we didn't know how to take them into account.

Before 1968, the MIT faculty and the Admissions Office were very much involved with visiting predominantly black institutions. In 1964, 46 predominantly black schools were visited by MIT faculty and Admissions Office staff. Do you have any sense about that? That was before Martin Luther King was killed. The institution was thinking about this issue before that time. We seem to have been a little bit ahead of some of the other institutions. Do you have any sense about that period of time? There was a report that was issued by the faculty Ad-Hoc Committee on Academic Opportunity appointed by the president. This is May 1965. Ron McLaughlin, the black professor in civil engineering, served on that committee. He was here before Willard Johnson was.

Yes, he was. He was only here a few years. He went off to create a company.

That's right, yes. He was on a Committee on Academic Opportunity here, and this report called for some of the same programs as the Admissions and Financial Aid Committees earlier had called for.

I think both Roland Greeley and Pete Richardson were acutely conscious of the fact that there was no reason to be anything but dismayed about the fact that there were half a dozen black Americans in each admitted class. That was not satisfactory. I don't know, I'm guessing now, but what had to be done to change that was that one had to be differentially aggressive in recruiting black applicants and one had to change admissions. Whether they didn't feel they had the authority to do that, or they were timid about doing it, I don't know, but they were clearly trying to get out and spread the word in predominantly black schools. Shirley Jackson came as a result of a school visit. I did school visiting in Houston and in suburban Washington—Virginia suburbs of Washington—in the early '60s. I saw black students there. But nothing changed here until we changed the way the Admissions Office dealt with it.

There are two other people who were involved in the task force early on that need to be mentioned because they were important to it. One was Dick Adler, in electrical engineering. Dick was a member from the earliest times. I knew him from 1950 until his death, and he had

always this capacity to be able to listen to a conversation and pick out the key issues and focus on them. He was very useful in that respect on the task force. The other was Al Hill. Now, I'm not sure that Al was involved at the very beginning, but Al was certainly involved in the physics department as deputy head of the physics department—in recruiting black graduate students. That's how Jim Turner got here, I believe. I think he was recruited by Al. As I say, I don't know that Al was involved in the fall of '68, but he soon afterwards became involved and, as you know, he was critical. It was his conception of the task force—or a group or committee which he headed—that led to the creation of the OME, right?

Talk just a little bit about that period, where essentially the task force developed the framework for what we are doing now and have been doing for probably twenty or thirty years.

It was essentially volunteers. I got volunteered by the president; other people we just kind of picked up as they expressed interest and as we thought they had something to contribute. The just-emerging BSU in the fall of 1968 decided on who was going to be representative for the black student community.

The first questions that the task force undertook in 1968 to 1969 were those that related to increasing the flow of minority applicants. I say minority, of course, but at that time the focus was exclusively on African-Americans. It focused at first on increasing the flow of applicants and then on how the admissions process should be construed in order to raise the probability of admissions from that. It also focused on student aid, recognizing that the aid question would be even more of a determinant of admission for most of these youngsters than it was for the average kid at MIT. I think I told you about the dispute, the sort of non-dispute, that went on for two or three months, in which when the BSU folks said, "We want full scholarship," I assumed, and all my colleagues on the other side of the table assumed, so to speak, that that meant scholarship right up to full student cost. Actually, what was meant was all scholarship up to need, no loan. Once we got our collective heads straight on that one we easily got by it. That was the only issue, I think, in which there was a genuine, long-lasting misunderstanding.

We did then what we really still do to increase the flow of applicants, that is, we send material by mail to all those high-school students who have taken the SAT's who at that time indicated that they were African-American—now other minorities are included—and who have scores in the range that at MIT might make sense. A little brochure went out that first year that was produced by the task force, or that certainly was approved by the task force, and resulted in sort of a ten-fold increase in the number of minority applicants. That's been the core of the effort ever since. It was supplemented in those early years—and is still supplemented to some degree—by school visiting in schools where minority populations were very high. A number of the student members of the task force, and other students not involved in the task force but involved with the BSU, went off themselves on school visiting trips during that first year.

We talked a little earlier about the admissions issue. I tried to reflect it in these terms, that there is a group of students among the applicants who no one would have any trouble deciding they were admissible; there's a smaller group of students who most folks would agree right off the bat are not admissible and should never have been encouraged to apply; and then there's that large group of people in the middle, most of whom are probable candidates and could probably make it at MIT, but you can only admit about a third of them because of the limits on the class size. Our view up to then had been that we should go through that process in a way in which we admitted what seemed to the admissions staff, to admissions readers, and to the faculty who were involved in the process the most qualified subset out of that big middle group. So you would get that class size you wanted. The change we made—which in essence has been present ever since, although I think the distinctions have decreased over the twenty-five years we're talking about, more than twenty-five years—was to say we will separate out the minority applicants and the question we will ask of that group is not, "Which is the best qualified subset?" but "Which is the subset who by all we know and can learn look like they can make it at MIT, and we will admit them." That led to forty-eight or forty-nine black students in the class of 1973, the class that was admitted in 1969.

Now that issue of who can make it, who do we think can make it, of course, was highly subjective at the outset. We were working in a complete vacuum in terms of knowledge about how students with scores in these ranges, and from schools that we largely had not had applicants from before, would perform here. I think we probably made some mistakes in those years. I *know* we made some mistakes in those years. We admitted young men and women who would have been better served by going to a place which was less demanding. We also got some great surprises in that time, in the sense that people who looked just like ones who didn't make it turned out to be real stars, academic stars. It just increases one's skepticism about the admissions tradition.

One of the things that task force did—or at least encouraged me to do—in those early years was to analyze as best we could the results that began to accumulate as people went through in the early 1970s to see if we could improve our admissions process at all, improve the selection rules. We worked hard at that. There were two graduate students in Sloan who worked with me on it for a few years. Jim Taylor was one of those. The other was Kenneth Schoman. He worked for a long time in the student affairs office in the early 1970s. He worked on it for a while. Then someone in the admissions office in the middle 1970s began to pick up that responsibility. It's not surprising as we look back on it, I think, that we learned that there was no statistical approach that was going to give you any better assessment.

Is there anything you can think of, in examining or analyzing the data, that you recall as being very important things that you could review and actually begin to evaluate who should come and who should not come?

The most important, the most statistically useful, the most valid indicators were the same ones, not surprisingly, that had emerged as the most significant in the previous twenty years. Rank in class, number one; grades in math and science, number two; and achievement test scores particularly in the quantitative areas, science and mathematics, number three. All that's on the quantitative side, that you can measure. On the more subjective side, the same things that have always seemed to matter for students who do well here. It has to do with: Is this a young person who does more than he or she is required to do? Is this somebody who shows real motivation for a science-based career? Is this

somebody who has given some evidence of leadership in what they have done? Those qualities that have always been and still are important. It's how accurately you can assess them. Do you have the data in the comments that come from teachers and guidance counselors and all the rest to enable you to assess that?

When did the task force cease to exist? I don't know, some time in the early to middle 1970s. A couple of other things that it did were important. The task force responded to the initiatives of the BSU in creating the Black Students' Lounge, the BSU Lounge in Walker Memorial. It created a course which was offered, I think, for the first time in 1969 or 1970. There were a lot of guest lecturers who came in. I have forgotten who was in charge of the course. It was in what was then the Department of Humanities. Humanities was then one department; it wasn't divided into sections. There was a course offered that first year in which guests were invited to come in. The purpose was to talk about black history and culture. That course was taught for a few years and then there began to be more offerings in the humanities area. I don't think that course survived. It was offered for the first time in 1969 or 1970. That was a product of the BSU. Arrangements were made for upper-class students who wished to do so to be paid to be tutors, to spend time to be available as tutors, the BSU tutoring program. There was a young woman who was so effective in making that work. Her mother subsequently worked here in the dean's office.

Inez Hope.

Yes, Inez Hope. She made all the difference in that first couple of years in making that tutoring program. She's got pluck.

Maybe the most important thing that the task force did in those early years was to put in place the commission that Al Hill chaired. The most important thing, I think, that commission did was to study the circumstances then, after about four years of experience with larger numbers of at that point still mostly black students at MIT, to study that experience and say what more the Institute could do to help. Out of that grew the program that Wes Harris was the first director of, the Office of Minority Education, OME. OME was created, in effect, by that task force. That, I think, was maybe the most important thing that the task force did. It was Al Hill's group that did it, but we put it

in place. I should also say that in that first year we invented Interphase, Project Interphase.

What year, 1968?

1968–1969, yes, correct. John Mims was instrumental in that. In fact, the name “Interphase” is John’s creation. We kept running around in circles trying to figure out what we were going to call this thing, and John came up with that idea. That was a time in which we recruited Jim Bishop to lead that. Jim was just finishing a Ph.D. program here in chemistry. He came to work for me to create that program. We included Francis O’Brien over in the athletic department to run the social and athletic portion of it. We recruited a number of teachers, some of them folks like Shirley Jackson who had been involved in the task force. We ran Interphase for the first time in the summer of 1969. All of us had our hearts in our throats when those forty-something youngsters arrived.

That was a major stroke for the institution. We have to look at the period in which this was taking place and the institution—in terms of faculty especially, I suspect—was not all in tune with doing these kinds of things. I have heard that you had to stand tall on a lot of issues. I guess my question is, what kind of backlash did you have to deal with? I understand that could have been the case.

There was certainly some backlash, I’m sure, but most of it was not expressed. In that first year, the 1969–’70 year, I made presentations to everybody in sight. It sort of started with the Committee on Educational Policy, where we had to get approval for Interphase; I made a presentation to the Corporation; some time in that year, I made a presentation to the executive committee of the Corporation; I made a couple of presentations at faculty meetings. The one that sticks in my mind was in April of 1969. We had a faculty meeting where the majority of the agenda was devoted to a report from the task force, which I participated in but didn’t carry myself. Some students were involved with it as well. It was the first time that the faculty at large had had an opportunity to hear in some detail about what we were doing and what was coming. There was no expressed backlash or expressed opposition. There were questions raised, to be sure. Are we doing the right thing here? The question that is hardest to answer—was hardest to answer then, is hardest for me to answer now—is, Are you putting a set of young people, those who turn out to really struggle at MIT, in a

circumstance which is going to do more harm than it’s going to do good? I mean, are you going to do damage? Are you going to grind people down? I still worry about that.

I started out with a group of sixteen sophomores five years ago in EE as their faculty advisor. I’m just seeing most of them through now. They got their M.Eng. degrees this past June. Now in that group of sixteen, there were four black students. One finished up with a bachelor’s degree in four years—struggled at the beginning, but did okay and finished up. I don’t know what he’s doing now. One went out of here this year with flying colors—a spectacular student. Neither of the other two is here now. One has been away for about a year. He was asked to withdraw for academic reasons and the other has been here this year but is not yet registered. He has done a whole year’s worth of work without being registered. He was in serious difficulty for the first three years he was here. I have no doubt about one student. Another student had personal problems, family problems that distracted him. I guess I don’t have a lot of doubt about the other student either. He’s a bright guy if he sets his mind to it. But every once in a while along the way, I wondered if we had done these folks a favor—two students, in particular.

If questions were raised in those early years, they were raised in a spirit not of opposition or backlash but in a spirit of honest questioning that you are admitting now students who would not have been admitted previously, which was certainly the case. Not for all, but for some. Are you putting more stress on them than they should be exposed to? I mean, an aspect of this that I’ve had to keep saying for thirty years—and say it whenever I get a chance—is, “You should not look at the whole minority cohort at MIT and say they got here under special circumstances.” The fact that we reached out to produce more applications would have meant that we would have admitted more minority students even if we hadn’t changed the admissions process. We were producing more applicants. My guess is that if we hadn’t changed the admissions process we wouldn’t have had forty-eight students in the fall of 1969. We might have had twenty or twenty-five. There was a tendency—there is always a tendency—to look at that group as if it’s a homogeneous cohort and it isn’t. It covered a whole spectrum in terms of expressed intellectual capacity. I mean, some of

them are by anybody's measure outstanding students. Others plod along, as some other kids plod along. I wrote to one student last month after graduation and told him that I wanted to say to him what I've been saying to others who had asked me about him for the past year, and that is that in my experience at MIT over forty years with lots of students he is one of the top ten in terms of his promise and his combination of personal and intellectual skills. I said, "I see in you the seeds of greatness and I want to know what you do with your life as long as I live." He was a super student.

And you've seen a lot of students.

I've seen a lot of students. But again we're getting here into some of the issues that have been and continue to be raised about, broadly put, affirmative action and, more narrowly put, about what we do at MIT. We have to keep saying that you can't think of African-Americans or Hispanics or Native Americans or Asian-Americans as a homogeneous group. They have all the natural human variability that the rest of the population has. They should not all be tagged with the same label of "Well, they were admitted because MIT had a special program."

Again, when we look at, say, your role at MIT during the period when you were chancellor down to 1980, when you became the president, can you identify any of the milestones as chancellor? You were the day-to-day person. The presidential position was almost split up, whereby you were the day-to-day person and Jerry Wiesner was very much involved in the campaign to get funds and so forth.

The campaign started in 1975. From 1975 to 1980, Jerry spent a lot of his time outside.

You actually were running the institution on a daily basis.

On a daily basis.

Now, during that particular period before you became president, can you recall any significant events or programs or decision-making process as it relates to the whole issue of affirmative action, increasing the number of black faculty and administrators?

Well, it was during that period, during the 1970s, that the federal government was getting much more involved in a regulatory reporting way with universities on aspects of affirmative action. That is, we were getting much more formal in the prepa-

ration of affirmative action plans, in the reporting of data, in field reviews by federal bureaucrats—I don't know whether it was the Department of Labor at that point or the Department of Education, it doesn't matter—who were coming to see how we were doing. I remember with great clarity a meeting. I don't know whether you were present or not. I know Mary Rowe was present. She has reminded me about it; she says it's the only time she ever saw me lose my temper. There was some bureaucrat from somewhere in the government who was giving us hell because we didn't have a separate affirmative action plan for the Lincoln Laboratory.

I remember that.

We sat around down there in the president's conference room and I explained to her six ways from Sunday that the Lincoln Laboratory doesn't have a separate plan because it's part of MIT, it's part of corporate MIT. She kept coming back to it, "But it's a separate organization." Finally, I lost my temper. I spent a lot of time in those years dealing with those issues inside and outside—outside in the sense of dealing with people here, I never dealt with them in Washington or the regional offices. I guess I did one time in the 1970s go to the Boston regional office for a discussion—you went with me—about our affirmative action plan. I regarded much of that activity as non-productive. All the time we spent on collecting historical data and compiling statistics and writing a certain amount of boiler-plate was not helping us get on with the task. That satisfied the feds with their urge for uniformity, but I don't think it helped us much. It was fortunate in those years that Jerry Wiesner had a very long history of commitment to the civil rights movement and to greater opportunity for minorities. Jerry had been deeply involved in the civil rights movement when he was in the White House in Washington with John F. Kennedy. He came back here and got involved in a variety of activities in Roxbury. Ruth Batson and Jerry were bosom buddies, had been for a long time. The fellow who was the first president of Roxbury Community College—he worked at MIT during the war. He was well known on the black scene in Boston: Parks, Paul Parks.

He has been very much involved with almost all the activities around here.

Yes. Jerry had known all those people for years. Even before he went off to Washington, he had been close to them and was deeply, deeply committed to changing MIT. If that had not been the case, not a lot would have happened around here, I'm afraid, in the 1970s. I couldn't have driven it as chancellor. The president had to be supportive. If you look back at the record, you'll find that it's the decade of the 1970s when most of the expansion around here in female faculty occurred. There was some considerable expansion in black faculty as well. A lot of it turned out to be kind of transient in the sense that people came and people went. I think at the end of the 1970s it was a disappointment for all of us that we didn't have many more black faculty than we had in 1971. But Jerry drove a lot of that, particularly the changes in the faculty. I don't know whether this set the stage for the big increases, the substantial increases in the female and minority enrollments in the 1980s.

Now, it's your feeling, when you look back at the period of the 1970s and 1980s, that in the 1970s we got a push from the federal government in a way to kind of structure things. We made some progress, but then it's your feeling that basically a lot of it was not all that good. We did better, but then in the 1980s we didn't make any major progress.

We didn't make much progress, on the faculty side. We continued to make progress on the student side.

That's where we actually kept a steady pace. But what do you think happened about our inability to increase the numbers of minorities on the faculty?

If you look at the data about African-American Ph.D. production all through the 1970s and into the 1980s—and I must say I'm not familiar with roughly the last ten years—it was going up in the aggregate. The published number of Ph.D's awarded to black Americans was going up, but if you looked at it in detail much of that was in other fields. It was in sociology or it was in education. The numbers in engineering and science did not go up a lot. My recollection is that they were in the range of one percent throughout that whole time. My belief for why we didn't do better on the faculty side is that we were looking at a pool which was not growing through the 1970s at a time when the institutions at this place were expanding, growing their faculties. We were all fishing in the same small pool. We were all looking

for the same set of outstanding folks, and we didn't make much progress on it.

Let me challenge you just a little bit on that. Although this is in the 1980s, when you were president, when we look at that ten-year period I remember a meeting we had. There was a question that came up in the Academic Council. We were trying to look at how we had done relative to graduating our own Ph.D's. It may have been Walter Rosenblith and Jerry, and you were the chancellor. Walter asked the Graduate School office and John Turner to take a look at all the black students who were coming out with their Ph.D's. We had at that time something like ten or twelve people coming out. Walter asked that they be looked at carefully. Somebody went to each of the department heads to get an assessment of each graduating student. The report came back to the Academic Council that none of the graduating Ph.D. black students were faculty quality. Do you have any sense of that?

I remember that, and I think it was in the 1970s.

It was in the 1970s, that's right. That is somewhat still the case, but if you look at that period, what do you think of that?

Well, maybe there are three things you could say about it. The simplest answer is that in thirty percent of MIT, in the School of Science, there is this longstanding policy that they wouldn't hire their own Ph.D's. They might take them back if they had gone off somewhere and done a good postdoc somewhere else, but they wouldn't hire them straight out of graduate school. There's no such compulsion in the School of Engineering. Through the 1980s, we were in a period in which the number of hires across the board—not just science and engineering, but across the board—was declining fairly rapidly. The faculty was no longer growing. Faculty growth stopped some time in the 1970s. The faculty was aging and the number of junior positions that were open within tight budget constraints was not very large. The data are available about the number of hires at the entry level over that period. I think you'll find that they were going down, steadily. We weren't hiring as many.

I guess the last thing to say about it is that in terms of faculty hiring, faculty appointments, the place is awfully selective. One wants to fill those positions with the best people it can find. Not every Ph.D. who comes out of here is going to have what it takes to get appointed to this faculty.

That's true regardless of race. It's probably true at all the places that we think of as our peers.

If you look at becoming president in 1980, if you look over your tenure there, what were the tough decisions that you made?

You know, you're not the first person who has asked that question. I have generally resisted answering on the grounds that the history ought not to be written by the people who made it. It ought to be written by somebody who's more objective. I'll make some comments on it. The 1980s were a period of significant belt-tightening for MIT. We took a big five percent whack at the budgets in the early 1980s, Francis Low and I did. That was a major undertaking—not easy to do, not nearly as hard to do as what Vest is trying to do right now, reengineering. We did one of those in the 1970s as well. I did one when I was chancellor, and we had taken out an awful lot of the slack.

One of the more difficult things that got done in the 1980s—and I think has already proven to be important and will continue to be significant in the life of the place—was the affiliation with the Whitehead Institute. You will remember that there was opposition in the faculty. There was some opposition in the Corporation. All those awful nightmares that had to do with why we shouldn't do it, none of them ever came to pass. The Whitehead has been spectacularly successful, entirely because David Baltimore insisted on being extremely selective in who he brought into the place. It has improved and expanded biology—biology graduate education and biology education generally at MIT. It's a great thing. It was hard for the Institute to do. Francis Low and I put an awful lot of effort into it.

The last part of the 1980s for me, from 1986 on, was pretty well occupied with the campaign. As had happened in the 1970s when I was running the school and Jerry was raising money, I was raising money and John Deutch was running the school. One of the events in the 1980s that will always be on my mind as something that on the whole we did not handle terribly well—and that for me became a kind of overriding concern toward the end—was the disagreement over South Africa investment and all that. When I say we didn't handle it awfully well, I don't mean that I think we made the wrong judgment in policy, but the fact that it became in the last couple of years

of my presidency an issue which mobilized an awful lot of students. That protest got pretty high-tension at times. Somehow I think we could have done that better, could have handled that better, could have avoided that. I felt by the time I left that office in 1990 that the students had succeeded in personalizing that whole issue in a way which focused exclusively on me. I didn't like it very damn much. That was tough. It hurt to be regarded as the enemy by even that relatively small set of students.

There was a young man I think about quite frequently who played such a major role in that attack. I can't think of his name. He was a black student. You know exactly who I'm talking about.

Exactly.

He was relentless in his negative comments and the things that he would do to the administration.

Yes, he had a kind of mean streak. There was another. There were two. He could still be around for all I know. He was a graduate student.

So there are two things I mentioned about that period—one that I regard as a substantial accomplishment and the other as a significant failure in some sense. I think we managed in those years to bring some very good people to MIT, both in the faculty and in the administration.

For example.

Well, Nan Friedlaender in the administration as dean. Ellen Harris toward the end of my term—a year and a half before the end, a strong appointment. Jean de Monchaux. John Deutch. I appointed John dean of science and provost. I have no regrets about either one. Gerry Wilson. These are all appointments I made.

Is it not true that it would have delighted you if John had taken your place as President of MIT?

That's true, yes. I understood, I think, why the Corporation, why the search committee came to the conclusion it did. You will remember that another failure in that time related to the applied biological sciences. Not the judgment to eliminate it—I still think the judgment was right—but the way it was handled. All of that got laid, quite unfairly in my view, on John Deutch. He was seen as the hatchet man who made it happen. It was not his judgment alone. It was a judgment that he and I made together. I bear as much of the responsibility for that as he did. We relied on others to imple-

ment it, and that was where we got in trouble. We should have played more of a role ourselves in the implementation. But in any case, that happened in 1988, maybe, 1987 or 1988? That set of folks who were so upset about that decision and the way it was handled blamed John for all of it. All that anger and animosity came to roost when they were looking for my successor.

It was bad enough that it came to roost here, but it came to roost in other places too. John had been told by the chairman of the committee at another university which I'm not going to name—but a major research university—that he was going to get the nod to be president. People around here who had been closed to Deutch at MIT began calling their colleagues there, and they killed it. I thought that was dirty pool. John is the most able, most creative academic administrator I know, I've ever known. I think he would have made a good president for MIT. I'm not saying that I'm disappointed with what we've got. I think Chuck Vest has brought enormous capacity and strength to that job, but John would have been a good president, too.

It's interesting, I was talking to Shirley McBay two weeks ago in Washington. She says the same thing about John. She says he's probably the brightest guy she's ever worked with, just a super-bright guy.

But you know brightness, intelligence, sheer intelligence, intellectual capacity doesn't always go with administrative skill. John had them both, has them both.

What's the difference? How do you see the difference?

Well, there are an awful lot of bright people around this place who you wouldn't want to organize a three-car funeral. They don't have that capacity to relate to people, to get people to work together, to focus on a mission, and to get the job done. John does. That's what I mean. I mean, the ability to manage, to lead people is not necessarily synonymous with smarts, with brightness, with intelligence. You *need* that, it's necessary, but not sufficient. John had it all, has it all. I don't want to put it in the past tense. I look forward to his return. He says he wants to come back to MIT, and I hope he does. Shirley and John struck a lot of sparks, but there was a great deal of mutual respect.

When you look at that period of your presidency, you had a number of very good sessions and some heated sessions with groups of black faculty members. You met with them a lot, individually as well as as a group. Any highlights you can think about in that regard?

Well, there are some awfully good friendships forged there. I knew Willard Johnson long before 1968. Willard and I became much closer during that time. The same is true of Jim Young. There were some disappointments, enormous disappointments in there. John Turner was one of them—you know, the manner in which it happened, the reasons it happened. You've got to be always sad about a situation where you feel like you have a lot of confidence in and trust somebody and then find that your trust was not well placed. Frank Jones and I knew each other before 1968. We spent a lot of time together, one-on-one time. All through this period, Frank tried to help me understand what the needs were. I look back on those meetings—which we had fairly regularly during the early 1980s and in the 1970s, and which we did not continue at that pace in the later 1980s—and think that that group probably got disappointed with me in some sense because we didn't make much progress, didn't make any tangible progress in black faculty in that decade.

If you reflect on that period too, now that you mention it, OME became an issue at one point. I think you met with almost all of the senior faculty members at that time trying to see if one of them would take the office of OME and continue to work on it. Without giving the names, what were some of the things that surprised you? You never were able to get anyone to take it.

It disappointed me greatly that no one would step up to that, it really did. There was one of those fellows in particular, whom I shall leave nameless, who not only wouldn't do it but brushed me off in a way that I thought was just contemptible. OME mattered around here. It was important. I just could not understand, found it hard to understand, why members of this faculty who had seen it come into being and who knew something about its history and its significance weren't prepared to dedicate a few years to it. I wasn't looking for somebody to lead it for life, but somebody to head it for a few years as it was developing. As you know, we then eventually had to turn to staff folks as leaders, for the most part. Art Smith led it for a year or two.

That's right, yes. I took over after him. The office never was the same. Wes Harris had taken it and developed it to a certain point. We look back at it now and it hasn't changed.

There has been too much turnover.

We knew that that office was going to be successful to the extent that it made a difference at least in this kind of environment. But it had to be a faculty type to provide leadership. When you think about it, there could have been points of OME—that was one—where we were trying to get someone to continue the work that Wes had done or continue as a faculty type to lead the shop. I know you talked to each and every one to sort of get their feelings.

One thing that struck me in that period, in the 1980s, and still puzzles me, is in that group of fewer than twenty people there were some animosities and antagonisms that I've just never understood.

Well, that's right. I think that's one of the disadvantages of having such a small number of people who are seen in many cases as a whole, as a group, and therefore are seen as people who are supposed to act alike.

There's an assumption of solidarity, which is unreasonable. I mean, people are going to differ in their views on lots of things.

And the smaller the group, with that kind of false concept, it makes it even worse because it puts the pressure on those individuals in such a way that they even act up worse than they would normally. I think you're seeing that. That's why it's just so important to try and get a larger number. If you look at the student category, you really can understand. They are respected, one by the other. But it's hard when there are less than twenty faculty members and administrators probably, when you put them all together. It was not a pleasant period. I'm trying to figure out what made it so unpleasant. Was it the time, or what? That was a tough period.

Everybody involved in these issues was disappointed. I mean, that's part of the reason. It's a sense of failure, a sense of disappointment that we hadn't made greater progress. There's more to it than that. As I said at the outset, I don't understand it—why it got so scratchy, so unpleasant. It was not a good time.

I think part of it also was that we weren't making any progress.

Yes, that's what I mean by disappointment. There was no progress being made. People had commit-

ted to it, felt committed to it, felt they had invested themselves in progress—and it wasn't happening.

We also had a lot of resistance there from departments. People really resisted. Ideas and concepts, excellent kinds of processes that we could use, were passed on to the academic departments.

Some of them acted and some didn't. I remember a meeting at a faculty council in the spring of 1969, back before this time. I was making a presentation to the council that had to do with faculty appointments, affirmative action in faculty. We were going over the timetable. It was the first time we had been asked to come up with goals and a timetable. Lots of us had talked about this. It had been a subject of discussion at Academic Council. But in my naiveté, Jerry's naiveté—Howard Johnson's naiveté, Howard was president then—I suggested that we ought to set a goal of thirty black faculty in the next two years. We got thirty by saying it ought to be one per department—and for the larger departments, two. There was a department head there in the front row. This was out at Endicott House. We were sitting in that living room out at Endicott House. There was a head of a major department there, who is now long dead. He said, "Would it count if I put on black-face?" There was a sort of uncomfortable silence in the room. Nobody wanted to say anything. Some people, I suppose, wanted to laugh. Some people wanted to say, "Go to hell." And the moment passed.

That was 1969. Nobody would make that comment in 1985, but there were still some people in positions of leadership in departments who felt that way.

Your department, electrical engineering, was one of the real leaders, has always been a leading department. I'm not sure, but I don't remember them doing all that well on minority faculty.

No, they didn't do all that well. They still haven't done all that well. And it's not just our department.

In fact, one of the black faculty members who I think was there at the time, during the 1980s, had to actually get a lawyer from the outside to fight his case. Yes. You had to set up a committee through Francis Low to look at his case. Do you remember that?

Yes, I remember that. I remember it well. One of the members of the faculty in that department, who was skeptical about the wisdom of making

that tenure appointment, was Richard Adler, whose judgment and views I have always had a great respect for. I'm not close enough to the department now to know whether that was the right judgment or not.

I don't know, but it's an interesting phenomenon. I think we also had another one in that department—I thought, from a distance—who eventually went to the University of Chicago. He's doing exceedingly well. That's Raphael Lee.

Yes. I saw Raphael a couple of years ago at an alumni meeting in Chicago. He is doing very well. Now, I think he could have stayed here if he wanted to, couldn't he?

No. The word was he wasn't good enough. I think there may have been some other things underneath there, but the decision was not understood well by the medical community—key people in the arena where he did his research, at Mass. General and other key medical centers in the Boston area. There were definitely some issues in the department in terms of why he was not able to stay. When you're in the president's office, you are unable to exercise any influence at the time when the judgments are being made on the things that later often blow up in your face. They're happening at some sub-level in a department, which could be a big department. I couldn't begin to list the number of cases in which Francis Low and I or John Deutch and I were involved in trying to deal with a serious problem after it had blown up—blown up to the extent we were being sued or dealing with some outside agency about it. These were not all ones that affected minority faculty, by any means. Many of them affected women faculty. When you looked at it, you came to the conclusion that the thing had gone off the track six months or a year before in some departmental committee which had screwed up in the way it did the work. From then on, it was all downhill. By the time it got to the president's office, you were dealing with an awful lot of bad history.

Well, that's a very important point. I always felt, particularly in some of the cases that I would bring to you, that that's what many people do not understand. Being the president of a university, a lot of people from outside that office seem to think that this person has this global power to deal with things. In a university, particularly the kind of research institution we have here, it's a whole different thing that one has to look at sitting behind that desk as

president when something involved with faculty comes up. Could you talk a little bit about how one thinks about that?

The most important understanding, I think, that you have to have if you're involved as president or provost or dean or department head or any kind of manager on the academic side at a place like this—a research university—is that the task is not to direct in any sense of that word, direct the intellectual directions that the institution takes or the choices that the faculty make about programs or research activities. Rather, your task is to provide an environment in which the members of the faculty can exercise their intellect, their free judgment, and make the choices themselves about how the place is going to develop. I've found myself a lot as president responding to the sort of question, "Well, where are you going to take the Institute in the next few years? What areas are going to grow, what areas are going to trail, how's the emphasis going to change?" That's a question that the president can answer only after the fact because you rely on the faculty, with their own instincts and sense of what's important, to make those judgments and to move. It doesn't move rapidly, it moves like a glacier, but it changes and the changes reflect the intellectual judgment of the faculty.

That's the way it has to be, I think, in a university. In a corporation, a profit-making corporation, the president says "Do this!" and everybody salutes and says "Yes, sir!" In a university, the president says "Do this!" and everybody says "Why?" It's very different. That was not news to me when I became president because I had been involved with Jerry for all those ten years and saw it there. Jerry put it very well early in his presidency. Someone said, "What's it like?" I was with him, in his office. He said, "You know, before I came into this job"—and this is a man who had been provost for five years—"before I came into this job, I thought that being president of MIT would be like being the skipper of a marvelous racing yacht. I could give a command and the crew would do it and we'd sail along just fine. When I got here, I found it was more like going down the Colorado River in a rubber raft." Pretty good metaphor. You don't manage, you don't lead, you don't function as president in a place like this by telling people what to do. If you want to lead the place in a certain direction in which you think it ought to evolve in a certain way, you have to start at the grass roots by

talking about that and hope that eventually there will come along some enthusiasm for it.

Now, I tried an aspect of that when I became president, and really failed. You remember at the inauguration I talked about pace and pressure, turning down the pace a little, turning back the throttle. People heard that, but neither faculty nor many students thought that was a very good idea. And it didn't happen; it really didn't happen. Now people say, "Well, you shouldn't think you failed at that because it might have been even worse if you hadn't tried." That may be the case, but you don't produce change in a place like MIT by saying, "We ought to change for these reasons—follow me." You produce it at best by encouraging at the grass-roots-level people to think about change and possible new directions. Maybe you'll move that way.

George Shultz, when he retired from the State Department, was interviewed by somebody from MIT, one of the people in the News Office. The interviewer said, "Dr. Shultz, you've been dean at Chicago and you were president of the Bechtel Company and you were Secretary of State. What's it like to be a leader in three different settings?" George put it all together in one sentence. He said, he discovered that in industry you had to be careful when you told someone to do something because the chances were very high they would; in government you didn't have to worry about that; and in academe you weren't supposed to tell anybody to do anything. It's an exaggeration, but there's a lot of truth in it. If you come in as president—as John Silber did twenty-nine years ago, twenty-seven years ago—to an institution which is about to go down the tubes, about to fail, then you can exercise a kind of imperial presidency as John did for most of the last twenty-seven years because there's nobody to push back, there are very few people to push back. He turfed out a lot of faculty, he brought in some new people, some good people. He made great change there. He increased the endowment by an order of magnitude. He got the budget balanced, he increased the student enrollment, he increased the quality of the students. If you're in that kind of a setting, you can be imperial about it. You can't be imperial at MIT or at Harvard or CalTech or any of those places you would think of as our peers. You saw what happened at Yale with Benno Schmidt, when he tried to be a little imperial

about it. They rejected him. Three years I think he was president.

What did Constantine Simonides mean to you?

Constantine was my closest male friend and had been for a long time. I didn't know Constantine when he worked in the Sloan School. I didn't know him until he came to work for Howard Johnson, when Howard became president in 1966. The sort of experiences that bonded us, in some sense, was all the uproar around the Vietnam war. Constantine and Jim Culliton and I, we lived together. Constantine and I lived together for two weeks in one of those MIT apartments at the top of Eastgate at the height of the uproar in 1969. There wasn't time to go home. We became very close friends.

You may have heard me say that one of the difficulties of being chief executive officer in any organization is that everyone inside the institution is accountable to you in some way, directly or indirectly; there is no one within the institution that you can really share your deepest worries and concerns with. You've got to find somebody outside the institution to do that. At MIT, having a chairman who knows the place was a great advantage to me. I relied a lot both on Howard Johnson and on David Saxon, and I think Chuck Vest has relied to some degree on me in the same way. Constantine was the exception to that because we had kind of grown up together. He was somebody I could talk with about almost anything. I knew that I could get an honest opinion from him and that if there was something that shouldn't be shared with others, it wouldn't be shared with others. When Chuck called me that Sunday to tell me Constantine had died—I was out in California about to speak to an alumni meeting—it was an awful, awful moment. He was my closest male friend.

I knew the two of you were very close. I know from my working with him, and watching the two of you work, it was obvious to me that he was very special to you. You consulted him a lot about major decisions.

About anything. It was always important to hear Constantine out. You may in the end decide to disagree with him, but he brought something to the problem. He knew the place so well. Everybody around here knew him. You hear this now, two years after his death. Someone in this office, who has gone through a very difficult time in the

last months, said to me this morning, “Well, none of this would have happened if Constantine had been here.” He was probably right, because it was in his area of responsibility and he wouldn’t have let it happen. He would have understood it at some gut level and sorted it out. He was an amazing man.

He was. I learned a lot from him in terms of just how to work. He could work, work, work. He could produce. I can’t imagine having someone working for you like Constantine. If you needed something, the next morning—if it took all night—he’d have it for you.

Yes. In a way, Constantine’s finest hour around here was sorting out the antitrust mess with the Justice Department. No one else, I believe, no one at MIT, none of our attorneys, could have done that. The Justice Department withdrew the complaint. That one-page agreement that we came up with. Lots of people over there helped, but it was Constantine’s persistence that finally wore down those buggers. They weren’t prepared to work like he was.

I also knew that he had—what a lot of people probably did not know well—a real belief in diversity. He really believed in the whole issue of affirmative action. Is that not your view?

I think it had a lot to do with his life experience, coming here as a foreign citizen—learning along the way to speak flawless English and to correct all the rest of us for our grammatical mistakes. He had the experience himself of being the outsider, of being the minority in this institution. He had grown up in this institution and he understood it deeply.

He sure did. I really enjoyed working with him. I learned a lot from him. He was quite an individual.

In relation to that, there was a time when you had to make a decision as to whether to actually fire—I use the term fire or dismiss, or find some way in a nice way to get rid of Shirley McBay. I know there was a lot of influence about what to do in that regard from other senior officers, opinions about what ought to be done. Now I may be wrong, but I think that was the case. There was a period when things were very hot about that. Constantine, I think, also played a major role in giving advice.

There were two people who really were most involved in that: Constantine and John Deutch.

Okay. It was my view, indeed, by 1989 or 1990 that Shirley having been dean at that point for ten years it

was probably time to have someone else come into that job. My recollection of it, and I was not necessarily involved when things got hottest—I think Constantine and John were—was that that transition for Shirley and for MIT was greatly eased by the fact that she at that point was onto other things. She had her involvement with QEM. She had carried it about as far as she could here and we supported her fully in that. She knew she had to give it her full energy if she was going to carry it any further.

Now, you appointed her, as the only Academic Council member of the Institute who was black.

That’s right. She was the first black to come in at Academic Council level.

Yes. At that time, when you reflect on that appointment and on what happened over her term here, what would you comment about in terms of what was good about her tenure?

From my perspective, it was almost entirely positive. Shirley brought not a different perspective but the black presence to the Academic Council. That led to a lot of sparks flying around the table. It also led to some important friendships. I mean, Shirley and Gerry Wilson struck sparks as often as not, but they became real pals. There was a deep respect there both ways and they were good friends. I have no regrets about that, none at all. I don’t think Constantine did either. It was Constantine really who hired Shirley. When Carola Eisenberg left in 1979 to be dean at Harvard, Constantine took responsibility for the dean’s office and ran the search that produced Shirley. He and I knew that we were doing something important when we appointed her in 1980. I have no regrets about that. When I say I think Shirley had stayed long enough, that’s not a comment about her performance. It’s just a comment that when you do that job after ten years, you begin to wear out. That’s one of the most difficult jobs around this place. You’re where the rubber meets the road. You’re mediating the conflicts between the institution and the students all the time.

In fact, it’s almost like the presidency. After ten years, something tells you that it’s time to go, right?

Let me say one more thing. This is something I’ve never said to anyone else, *anyone* else—not to Constantine, not to my wife who is my best female friend, not to anyone else. You asked earlier on in this conversation, “Was there backlash? Talk about the settings in which you were trying to

explain what the Institute was doing.” That’s how I took it. I talked about meeting with the executive committee and the Corporation and the faculty a lot. Why did the Corporation in February 1971, when they appointed Jerry Wiesner president, why did they appoint me chancellor? I think it was the result of the exposure and the impressions I had created as a result of this period. I was thirty-nine years old. Why did they pick me as an ex-officio member of the Corporation and Jerry’s partner in that presidency? The only reason they had to know me, to know much about me, was what they heard from me about the work of the task force and the effort to change MIT in that period, 1968, 1969, 1970. I think in some real sense I had the opportunity to be chancellor, and because of that had the opportunity to be president, because of the Task Force on Educational Opportunity. I may be completely wrong about that, but I don’t think so. What that committee thought, they never told me. In fact, they never told Jerry and me anything about how they thought we ought to function together.

After about two or three months in the job, about this time—about July, August of 1971—I made an appointment to go down to Bell Laboratories and see Jim Fisk, who was chair of that search committee and who asked me to do the job. I said, “Jim, how did you guys think about this? How did you construe this relationship between Wiesner and Gray? How is it supposed to work?” He said in effect, “Go figure it out.” They didn’t have any idea how it was going to work, but they knew we liked each other and respected each other. They knew we had worked together for three or four years and they had some confidence that we could work it out. And we did.

But I’ve often wondered why they did that, why they picked out a thirty-nine-year-old to be Jerry’s partner in that. I think the experience we’ve been talking about had something to do with it, probably with the experience and the exposure that I had in dealing with the uproar around the time of the war protests, which was all happening at the same time more or less. It had a lot to do with it.

SHIRLEY A. JACKSON

b. 1946, SB 1968 and PhD 1973 (physics) MIT; research associate, Fermi National Accelerator Laboratory, 1973-1974; visiting scientist, European Organization for Nuclear Research (CERN), Geneva, 1974-1975; Stanford Linear Accelerator Center, 1975-1976; member of technical staff (MTS), AT&T Bell Laboratories, 1976-1991; professor of physics, Rutgers University, 1991-1995; chair, US Nuclear Regulatory Commission, 1995-1999; president, Rensselaer Polytechnic Institute, 1999- ; president, National Society of Black Physicists, 1979; member, MIT Corporation, 1975- ; elected a life member, 1992; founding member, Black Students' Union, MIT, 1968.

I grew up in Washington, DC, in a family of six—four children and our parents. I have two sisters and a brother, although my brother passed away about a decade ago. I went through the public school system. All of my pre-college education occurred in the public schools of Washington, DC. When I began my schooling in kindergarten, the schools were segregated by law. They were integrated after the 1954 *Brown vs. the Board of Education* (Topeka) decision, and I would say almost essentially de facto re-segregated by the time I graduated from high school.

During the time after the initial desegregation of the schools, a tracking system was put into place in the Washington, DC, school system. There were four educational tracks: a basic track, a business track, an academic track, and an honors track which was an accelerated program. I ended up in the honors track, and because of that I essentially finished high school a year early. I did spend my senior year here in my high school taking advanced subjects, including an advanced math course that was an introduction to calculus. I took an economics course, advanced biology—which was a college-level biology course—and Latin. I studied Latin, in fact, for six years, and studied advanced grammar and composition. In addition, since I grew up in the post-Sputnik era, there was a lot of focus at the time on science and math. I participated in various programs along that line, ranging from science fairs to a program given by the American Heart Association on the cardiovascular system, where I went to lectures on Saturdays. There were a number of other things I

did. I participated in a TV program called “It’s Academic,” an academic quiz show, school-wide and then city-wide spelling bees and oratorical contests. I was a student delegate to a Student United Nations here, etc.

So I would say I had a rich experience. I was aware that I was going to segregated schools, or had gone to segregated schools, because of the switch that occurred early in my elementary school career. But in many ways I was less touched by racial issues than others living elsewhere. I suspect this was so because our parents also protected us from a lot. I was always interested in science and math, especially mathematics. Most of my science projects were ones that did not involve expensive equipment because it was not something that we particularly could afford. A lot of my experiments were biologically oriented, I think because that

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with Shirley A. Jackson in Washington, D.C., 5 February 1996.

was what was around me. I collected live bumblebees and did experiments on them, looking at how nutrition affected them, and how their environment affected them. I got a lot of encouragement from my teachers, particularly my math teacher and my Latin teacher.

In your pre-college days that you're talking about, when do you think you actually chose your field or career? You said you always knew you were going to be in science. Were there people—you mentioned your math teacher—who were very influential during that period of time? Could you talk a little about role models?

Well, I think I could honestly say that as far as scientific role models per se, I didn't have any growing up. In terms of role models to illustrate how one would live a good life, and the value of hard work, I think I got that from my parents. They were my role models in that sense. But in the conventional sense of the word, I had no role models because I knew of no one who was doing science research or mathematics as such. Other than my involvement with the American Heart Association program, I really didn't get to meet scientists per se.

You have to understand again that I was coming from what was a segregated school system that went through a transition. I think that my teachers were very influential in encouraging an interest and an ability they thought that I had in math and science, as opposed to their turning me on to something that I had not heretofore considered. I was actually, though, about equally good in the language arts subjects, the verbal, as in the math, and that was in fact borne out when I took the SAT's some years later. I mentioned to you that I had been in oratorical contests in my church and in my high school, and that I was in spelling bees in my high school and city-wide. I didn't win the city-wide spelling bee, but I went into the semi-final round, something like that. I had a good all-around education. Latin, the study of Latin, provided a fairly good foundation for the structure of language, as well as grammar and spelling. I think all of these things came together.

Let me move to how you actually got to MIT, and your experiences there as an undergraduate student.

Well, I was tracking to MIT early. I was my high-school valedictorian. When I took the PSAT's, and then later the SAT's, I did very well. The Assistant Principal for Boys at my high school was the one who really suggested that I apply to MIT, and I did

that. He did this, together with the college counselor at the high school. The Assistant Principal for Boys' name was Mr. Boyd and the counselor's name was Mr. Brown. Both of them encouraged me to apply to MIT, and Mr. Brown to apply for a scholarship from the Martin Marietta Corporation. Now, what happened was the Martin Marietta Corporation in those days offered three scholarships in the Washington area: one that would go to a student from the Maryland suburbs, one to a student from Virginia, and one to a student from the District, who were interested in studying math and science at the college level. I got the District scholarship from Martin Marietta. Interestingly enough, the Virginia and the Maryland winners also went to MIT. It was a big deal, and it gave me a four-year scholarship that covered tuition and some other things.

As far as going to MIT was concerned, I was excited about going. The more I learned about it, it seemed the perfect place for someone who had my interests, and I looked forward to it. On the other hand, there were those who felt that it might be tough because, as far as they knew, MIT really didn't have any black students, and certainly not any black female students. People told my parents there was a good chance that I might be the only black female at MIT. I was pleasantly surprised, of course, to find that Jennifer Rudd was there. She was in my class. We were there together. Of course, people who saw us tended to try to push us together all the time, and seemed to mistake Jenny for me and me for Jenny. In fact, if I would pass some of the students in the dorm, they would come by and say, "Hi, Jenny." And I'd say, "Well, my name is not Jenny." They'd say, "Oh, you're the other." I'd say, "Yes, I'm the other one." And they would do a similar thing with her. Or, if I would go to the cafeteria in the dorm—and we ate in the dorm at that point—if I sat down at a table where other students were, they would want to know where Jenny was. And some of them would get up and leave the table, even if they weren't totally finished. If I sat at a table alone, I, by and large, would still be alone by the time I finished eating, even if other tables were occupied. This was particularly true in my freshman year.

It was also difficult to get into study groups. In fact, in working on the first physics problem set that I ever had at MIT, I was in my room working on it for a while. I got up to go to the wash room,

and when I left my room I found the other girls—the other freshman women on the floor—were working together on the physics problem set. When I tried to join them they told me to go away. That, in a way, highlights what the early experiences were, namely some degree of isolation and an inability to penetrate social and study groups, with the exception of Margaret MacVicar who was the women's physics tutor in McCormick Hall at that time and a friend of hers, Edie Goldenberg. Margaret was fairly straight with me and we became friends, and that friendship persisted through the years until Margaret passed away a few years ago.

How did you do so well, though, even despite some of these situations you mention?

Brilliance. [laughs] Focus on a goal, motivation, and determination not to be worn down. I thought if I gave up, those who wanted me to give up would win. Since I didn't want that to happen, I persisted. In addition, I enjoyed science and I never lost that love of science and math. That's why I'm a physicist today. I knew it was very important also to my parents and my family, and to my community, that I succeed. You could argue that that was a lot of weight for someone to be carrying around as a freshman and sophomore at MIT, but I did feel it very strongly. I also came out of a strong religious base. All of these things together gave me quite a bit of motivation, and even in the days when I might tend to lose confidence, in the end I still had an inherent belief that I was doing what I was meant to do and I had the ability to do it. So I did it.

There were a number of things that you got involved in that did not necessarily deal with the academic part of the institution. In a way you felt a need for some of these things, you and perhaps others. Could you talk a little about some of those things that you got involved in and sort of were responsible for?

Well, I think most people who think they know about my extracurricular activities probably base them from the time of the MIT Black Student Union. But in fact, what most people don't realize is that in some sense the BSU involvement was a natural follow-on at MIT from some kinds of things that I did early on. I told you I did come from a strong religious foundation, so I was always raised to believe that, in trying to move along, it's important to lend a helping hand to somebody else and that in spite of any difficulties I might

have been having, based on race or sex at MIT, that I was there, I was healthy, I was able to do the work, I was doing well. So I thought it was not enough just for me to succeed alone, and that I needed to try to help somebody else along the way. So, early in my career at MIT, starting when I was a freshman, I in fact did volunteer work, first at the Boston City Hospital in a pediatric ward for infants from birth to about age two—infants to the toddler stage. And I did that for a good part of a year. Interestingly enough, even though I was doing this to help someone else, it gave me a kind of strength because in looking at what these very young people were dealing with—ranging from physical deformities to leukemia to surgical problems, and they didn't even understand what was happening to them—it made me feel that I was very fortunate. So I got a lot out of it myself, as much as I thought I gave to these children.

And then I actually pledged Delta Sigma Theta Sorority in my sophomore year, and later became the president of the chapter for two years, that's the New England regional chapter—Iota chapter is what it was called. Again, that was a balancing experience for me. It gave me a larger sense of what black females and black students generally going to school in the New England area were dealing with at the time because, even though the numbers were minuscule at MIT, they were not large at any of the schools in that area at the time. We had membership drawn from as far away as New Haven, Connecticut. And so again, it was a question of something I enjoyed—the fellowship with these women and getting to know some African-American men through the affiliated fraternities and the social functions that we used to have, which were typically off campus. We couldn't use the campus facilities, so we would have them at various places in Roxbury. There was this place called the Negro Professional and Business Women's Club and we had functions there. In addition, there was a fire house on the edge of Roxbury where we got to use an upper hall. But we would have to rent it out, so we would have to charge money to cover our expenses. But again, students came from all over the place. That was a big part of it. I got to know some women who were at some of the universities around who grew up in Boston and Roxbury, and I got to know their families. They would invite me over on weekends and so on.

So one could call all of these experiences ones that helped me to keep a balance. Through the Deltas—a big part of the Deltas' vision is service—I did volunteer work at the Roxbury Y, tutoring students in math, as well as in fact tutoring some of the siblings of my sorors. So, by the time I came to my senior year, which was the year Martin Luther King was killed—that was a catalytic experience in terms of making me decide that I needed to turn some of my focus to MIT and try to get MIT to admit more black students, more minority students generally, and to be more hospitable to the ones that it had—I had already had a history which was not the history that most people at MIT knew of, of working out in the larger community and working on issues beyond my problem sets.

Martin Luther King was killed as I was visiting the University of Pennsylvania. I was interested in going to graduate school there. I had gotten admitted and gotten a fellowship, and had been invited down to come visit the campus and decide which professors or professor I might want to work with preliminarily. On my way back to the airport, we had the radio on. A soror of mine was driving me to the airport, and the announcement came that Dr. King had been shot in Memphis, then a little bit later that he had passed away. We almost ran the car off the road. It had a big effect.

I was a child of the King era, that whole struggle for desegregation. The March on Washington occurred when I was in high school, and it had a big impact. My parents had grown up in the South, had experienced some of the classic things that blacks faced in the South during that period, and more. So I was sensitized anyway, but I was a believer that if one worked hard and was qualified and lived right that one would be judged by the content of one's character and not by the color of one's skin. And, in fact, I still continue to live my life that way. I decided then, when I heard the announcement of Dr. King's death, that I needed to try to work at MIT and with MIT to bring about some changes. And I thought MIT was very important because of what it represented as a leading edge scientific and technological educational institution.

There were others who were similarly affected. A small group of us came together to present some demands—we called them demands at the time—to the administration. But we had a

full-blown proposal for how to go about redressing some things we felt needed redressing at MIT. Paul Gray, I believe, was the associate provost at the time, and I guess Jerry Wiesner was the provost. They formed this Task Force on Educational Opportunity that Paul chaired and I was a member of it, with a number of others. We would meet every week, several times a week, sometimes for the substantial part of a day, hashing through the issues, reading. Paul read a number of things—Malcolm X's autobiography, *Black Like Me*, *The Invisible Man*—and I think all of us were moved because of Dr. King's death, and later Robert Kennedy's death, to feel that something was happening in this country and we needed to do our part to try to help set it on a certain course.

Those were some trying times in many ways, but at the same time some of the most hopeful times. Those of us who were on the task force, in addition to talking about what ought to be done in meetings, actually each went out and did recruiting at high schools. I went out to Cleveland and Detroit. In fact, two of the students whom I recruited came to MIT and they attended Interphase. The original summer program was called Project Epsilon. Epsilons and Deltas are small numbers. So we thought Epsilon was a small program, but a beginning. And then out of that grew the larger Interphase program the next summer, the summer of '69. Project Epsilon was the summer of '68. I taught in the physics part of that program. Jim Turner, who was working on his doctorate in physics, was the head of the physics option that year. I guess he was like a counselor in the dorm. Maybe he was not head of the physics option, but he was one of the physics instructors, as was I. The next year I became head of the physics option.

We all worked very hard. We dealt with things ranging from admissions criteria to financial aid criteria to scholarship programs to a transition program, which was what Interphase was meant to be, to provide follow-on support during the school year, support to get the BSU lounge, etc. etc. etc. The BSU tutoring program came a little bit later in the game. That was an outgrowth of discussions we'd had about the need for continuing follow-on support in certain areas for students, as much to build confidence as to address specific skills. The Office of Minority Education came later. Our feeling in those days was that whatever happened—I

mean, other than the fact that Interphase itself was obviously a separate program in and of itself—some of us, and I was among them, chief among them, felt that what happened for minority students and black students in this instance had to be as much as possible an integrated part of the overall life of MIT and all of the existing support structures, that if there were student support activities and responsibilities in the Dean for Student Affairs Office, or the Dean of the Graduate School Office, that any programs that were oriented to helping African-American students should be part of the mainstream of MIT life.

And then we also dealt with issues of recruitment of black administrators and black faculty. We spent a lot of time on that one. And I would say that we had an impact in the sense that within a couple of years of that time a number of black administrators had been hired in admissions, financial aid, and the Dean for Student Affairs Office and the Dean of the Graduate School Office, etc. We had some success—not as smashing—but some success in the area of recruitment of black faculty, and in certain areas we did have success. But the number of black faculty has waxed and waned at MIT.

You talk about the kinds of activities you were involved in. Could we focus a little bit more on your career, particularly at MIT, going into your particular field? How or why did you decide to go into that particular field, and who was influential in that regard? You also moved from the undergraduate to the graduate program. There were some very significant things that happened in that period of your life. So, could you tell us a little bit about that? Well, as I had said earlier, I was always interested in mathematics. I was always an excellent math student and my original interest when I went to MIT was in mathematics. When I was a freshman, I took Freshman Physics 8.01, and I really got quite excited about and interested in physics. In addition, I took an elective course on the structure and properties of materials. It was a course that was really offered in materials science, the metallurgy and materials science department. That got me very interested in materials science, how to model the microscopic properties of materials and the like. At the same time, I was still taking physics because at any rate at MIT in those days it was required for two years. I was interested in electrical engineering, kind of interested in circuits and

thought that it was kind of a practical activity to do. I'd say that electrical engineering was beginning its rise. At MIT, at the time, there were more physics majors, interestingly enough, than electrical engineering majors. That obviously has changed. But having taken a network theory course, while I thought it was nice, I decided that I liked the more fundamental approach of physics. And even though I liked the materials science course, I thought that physics would give me the kind of grounding that would allow me to study materials properties at a fundamental and microscopic level.

About that time, I started working. In the summer after my freshman year, I'd worked in a lab with Professor John Wulff. He was a professor in metallurgy and materials science. It was he from whom I took the structure and properties of materials course. I got an A. There were two interesting anecdotes relative to that course. One is that I had the highest grade in the course. Margaret MacVicar was my tutor. She was a teaching assistant in the course. I was asked because my grades were high, and so far above that of the other students in the course, whether I minded if the next closest person got an A also. Being magnanimous in those days, I said: "As long as I get my A, I don't mind." So because I did well, I went to see Professor Wulff about getting a summer job. And he started asking me if I knew how to cook. You can imagine, given my background, how I reacted to this. He said, "Can you cook? Can you cook eggs?" And I said, "Well yes, I can cook. My mother taught me to cook." Then, of course, I was suspicious about what he wanted. So he says, "Well good, you're hired." I said, "To do *what*?" And he said, "To work in my lab." He said, "I know you were an excellent student in the course, but I needed to know if you were good with your hands. Since you didn't have any lab experience before, I figured if you could cook then you had to be reasonable with your hands."

And I worked there that summer. In fact, I worked in his lab—or what I'll call the daughter lab, that of Professor Bob Rose, Robert Rose—every summer that I was an undergrad, and even during the academic year for credit. This was well before the advent of the UROP program. There was just kind of a lab, an individual study course that one could take, and I always took it as an elective to continue working in the lab.

There came a point where I had to finally decide what my major would be, and I was told that colored girls should learn a trade. I was told this by one of my professors that I'd had in one of these courses. And I said, "Excuse me?" Colored girls should learn a trade. I was essentially being told that physics was maybe too theoretical, and I should major in materials science, metallurgy and materials science. But I decided that the trade I would learn would be physics. I majored in physics. I focused on what was then called solid state physics, now called condensed matter physics. I even took graduate courses in my senior year on the electronic properties of materials—solid state physics, taught by Millie Dresselhaus. I did very well and used to talk a lot with Millie. So I was essentially interested in pursuing graduate school studies in solid state condensed matter physics.

When Martin Luther King was killed, I decided to stay at MIT and the big thing at MIT was nuclear and high energy physics. In fact, at an earlier stage I had had a discussion with my undergraduate advisor, who told me that—you know, I was doing very well, I was doing well enough to go to grad school at MIT, but it would be better if I had more interest in the nuclear or high energy physics. My focus, as I said, at that point was in solid state. I had applied to MIT, actually, for graduate school. I applied to two departments: one was in materials science, one was in physics. I also applied to Harvard, Brown, and the University of Chicago. And I got into all these places and got fellowships to them all. I decided to stay at MIT.

I had done an undergraduate thesis that was a joint physics-materials science thesis: on the tunneling density of states measurements of superconducting niobium-titanium alloys. And that was an experimental project that had involved some theoretical analysis, based on what was called the BCS theory of superconductivity. That stood for Bardeen, Cooper, and Schrieffer. Their work was based on what is now called many-body theory. That made me think that I perhaps wanted to do that kind of work, and to pursue that in graduate school. So I applied to Brown because Leon Cooper was there, to Penn because Robert Schrieffer was there. John Bardeen was at the University of Illinois in Urbana. I was not sure I wanted to go there because I'd heard some things about its inhospitability. So I applied to the University of Chicago because a physicist by the

name of Falicov was there. I thought I might try to work with him, although I never ended up talking with him.

So then, as I say, all of that changed. I applied to Harvard because it was Harvard, and MIT because it was MIT—at MIT in two departments, physics and materials science. When I finally decided to stay at MIT, I decided to stay in physics. But having decided to stay in physics, MIT's focus then was in high energy physics and nuclear. I decided to do high energy theory, as much because I thought that the background—particularly in quantum field theory and some other aspects of high energy theory—would still give me the kind of physics and mathematical grounding that I would need to do many-body theory in solid state physics, which was still at the back of my mind.

So I stayed and started doing high energy. I ended up working for Professor James Young for my actual thesis, which was a thesis on what was then called strong interaction physics in an area known as multiperipheral models. I was studying a three-body problem using a type of multiperipheral model to look at the effect of intermediate states on the three-body scattering amplitude. The intermediate state described what was called a one-body inclusive interaction. I basically constructed the three-body amplitude using a type of multiperipheral model having a series of small momentum transfer interactions—a multiperipheral model with continued cross-channel unitarity. What those words mean is that it was a mathematical property of these scattering amplitudes that allowed me to use a multiperipheral approach to construct what was called a one-body inclusive interaction, which is where you have two particles scattering, but only one particle measured, plus a bunch of other particles that are not necessarily individually observed, but whose properties are averaged over. The continued cross-channel unitarity allowed me to use that kind of a scattering process to construct an amplitude for a three-body scattering process.

But in addition, I accepted projects with Professor Roman Jackiw in quantum field theory, on Bethe-Salpeter equations. It turned out that the two actually tied together when I did my thesis research because a set of equations I ended up having to solve to get a result in a kind of modified setting, what are known as Bethe-Salpeter equa-

tions, allow one to construct certain kinds of scattering amplitudes. But I also did this work with Professor Jackiw because the quantum field theory I felt tied more into the many-body theory, which was my original interest.

And so, armed with these two experiences, I went off to Fermi Lab, which had just opened as a high energy physics lab in Batavia, Illinois, and started my post-Ph.D. career. I'll stop there unless you want me to go on.

Based on your own experience, what advice might you offer to other blacks, other students who are in the MIT environment? You've spent a lot of years there, and established a lot of things. And you're still connected, so you really have never left. Your experiences are very important in terms of what advice you can give students, black students, faculty, staff coming to MIT in the future.

Well, I think that typically four factors play into how successful a person turns out to be. One, of course, is societal or historical positioning in terms of the willingness of the society to have people from certain groups to be able to pursue certain educational opportunities and certain careers. A second is that there really are career options and interesting activities that are worth pursuing, that are motivators. The two key ones—which are three and four, but they're key—are leadership by those in the position to do so, who as much as possible given societal constraints, etc. are willing to take a stand to move institutions along and to create opportunity. This is not about having unqualified people, but about those who have talent and motivation getting the chance to develop that and exercise it in useful activity. And the other, the fourth, is personal motivation. One cannot underestimate the importance of that. And I say that even as I realize obviously from my history—who I am; but it's not easy. It certainly was not in my case, but I'm not one that necessarily likes to spend a lot of time talking about how easy or not it was. There are a whole litany of experiences I could talk about that were tough. I've also had some positive ones that I can also talk about. But the fundamental thing is to have focus, to have early success—and I think my parents helped with that and my early educational experiences, my teachers helped with that—because early success creates the confidence to move on, as well as helping to create a firm grounding and the necessary skills to move forward.

And so focus, early success, self-confidence, and a kind of patience to know that it may take several rounds to get to where you're going. Or, you might lose a given battle on a given day, but you have to have some inner confidence that allows you to go back and do it again. We all have to know what our own abilities and capabilities are, but at the same time know that any given setback is not necessarily a reflection on us in terms of our ability. But we have to keep moving and, no matter what you say, other people can't—even if things are totally easy, so to speak—do your work for you. They can't provide your focus; you have to do it, each individual has to do it.

My life has been a story of opportunity offered and opportunity seized—and those two have to come together. We all know from a historical perspective that our parents and grandparents didn't have the opportunities we have, in spite of motivation, hard work, etc. So when that window in time opens up, however narrow a crack, one has to be ready and willing to step through it—even though stepping through it, even though it's an opportunity window, doesn't mean that it's going to be easy—but to recognize it as an opportunity window and to try to take advantage of it.

My experiences at MIT were not all bad. There's always a tendency to want to accentuate the struggle, but in the end it couldn't have been a total struggle or else I wouldn't be where I am. In spite of any things that may have happened, any bad things or not-so-great things—and as I say there was a litany of those—I nonetheless was successful. I did do well, both in the classic academic sense as well as walking through it with my psyche and my confidence still fundamentally intact. That's not to say I didn't have dark days, as people say, but it really is a question of what one's inherent disposition is. And I enjoyed working in the labs. These professors, whatever their motivations, did give me opportunity. They supported my applications to graduate school. I did get fellowships. I got into some of the best graduate schools in the country in my field, and have had the opportunity to work with some of the best researchers and teachers in the world—and have made a name for myself in my field.

What I didn't say was, after doing high energy physics for a couple of years, I decided to go back into condensed matter or solid state, my original interest, and had the opportunity to go to Bell

Labs. In those days, Bell Labs would hire you if they thought you were bright and could make that transition. And that's how I transitioned back to condensed matter. I had the opportunity to work on some very nice problems, particularly those having to do with the physics of two-dimensional systems. I was able to do some work in an area known as polaron physics, or two-dimensional electron systems, that I'm known for and garnered me election as a fellow of the American Physical Society. That work, plus my work on the outside in science and technology issues generally, together got me elected as a fellow of the American Academy of Arts and Sciences. And then I think all of these things have tracked to my being where I am today. I think my scientific and technical background plays into what I do here. This is a very technically based agency. I think my various organizational and managerial opportunities—ranging from ones I did in the community with the Deltas, to other outside organizations, to my jobs, and then being on corporate boards and other high-level boards—all have tracked to my being in the position I'm in, to really manage an agency like this, and at the same time to try to develop good public policy in nuclear safety. So it's an exciting opportunity, even as it's one that has always been fraught with some controversy. But it's an important one and it's a high-level one, and I'm honored to have been asked by the President to do it. I think I'm doing some things that are the right things to do, and will have left my mark when I'm done.

I think that one message that I would like to make sure comes across is that there are struggles—struggles that we African-Americans have emphasized, struggles that I may have dealt with at MIT. But nonetheless, there are talented African-Americans—multi-talented in many ways. I've been able not only to do well in traditional science but to do it as I've done a myriad of other activities. I'm able to bring the science, the policy, and the managerial features all together. I think that's why people respect me. I think that's how I ended up in this job, and why I'm able to do this job. So I'd rather, even though the times are tough, and, as I say, things always wax and wane, to have an upbeat tack.

Too often when I'm interviewed, people want to focus on the struggle part of it. I have to point out that I went to MIT thirty years ago. One

could argue in many ways there are a lot of endemic problems that seem similar, but for me personally I'm a different person than I was thirty years ago. I think it's important that people have the integrated picture, in terms of what I am and what I've gotten out of those experiences, how I dealt with them, and what they reflected about what kind of person I was at the time, what kind of person I am—but also how they in fact were also part of building into what I'm able to do today. To the extent that people feel I'm a success, then all of these things track to that—the professional, the education, even the baptism by fire, so to speak. It's what one can try to make out of it, that's important—and that not everybody treated me badly. Obviously, Paul Gray is a very good friend of mine and he has been very supportive of me through the years—still is, in fact. Margaret MacVicar was a good friend of mine. John Wulff gave me my chance. Bob Rose followed up with that in the lab. So these are things that I think people have to keep in mind.

One other thing I wanted to mention was the issue of role models. You know, there are those I call “unwitting mentors.” Most people think of mentoring programs as somebody deliberately working with a person. I think what I tried to do was, if I interacted with someone, unless they totally mistreated me—they may not have been particularly oriented to mentoring me or doing anything for me, by studying them and how they did what they did and learning from them as much as I could, then I made them unwitting mentors. They basically showed me some things, even if they weren't planning to do that. That's how I've tried to live, because not everybody that I come up against is going to be wanting or willing to lead me by the hand. But the question is—by my interaction with them, how can I bootstrap? I think that particularly for young African-Americans, we need to think more about that as opposed to whether somebody is specifically trying to hold our hands and help us along, because, on average, that's not going to happen. And therefore, what are you going to do about it? Sit back and cry about it? Or take what you can and move ahead?

I always felt that my high-school teachers, who by and large were African-American, were wonderful. My Latin teacher could have been a classics scholar had she been living in a different time or the values were different. My math teacher

would have been a mathematician, a mathematical researcher. And so on down the line. But they weren't. They just picked up where they were and did what they could, and they helped to make me what I am today. And so it's a bootstrap. My parents' children are having opportunities that they never imagined. And that's not to say everything is rosy, but it's a question of opportunities offered and opportunities seized—and being willing to step through *your* window in time.

I said that in many ways a lot of women at MIT, white females, were hostile. In the early days, they didn't want to work with me on problem sets. They would work with each other, not with me. I told you about the first incident when they told me to go away. They might speak to me in the dorm and not speak to me in the halls of MIT. I'd get my tray in the cafeteria. This was when I lived in McCormick Hall. Girls would be sitting at the table, eating their dinner, other women in the dorm. I would go sit at a table that had people at it. And even though they might still have their desserts, or sometimes food on their plates, all of a sudden they'd be done. And after a while I would sit and they would immediately say, "Well, where's Jenny?" And I would say, "Well, I can eat without her." Or, if I went and sat at a table alone, then I would stay alone, unless Jenny happened to come and decide to sit there. Probably the fact that we tended to be pushed together created some early tension, but I think we grew out of that pretty quickly. People were forever calling her Shirley and calling me Jenny. In fact, one girl's parents were up visiting once and I walked by, and she said "Jenny, I want you to meet my parents." But I wasn't Jenny, that was the only problem.

Then if I would go to class, I would sit in the middle of the second row because that was the best seat for seeing everything, particularly when the professors would lecture on a raised platform. But then nobody would sit around me. Or, I would do the problem sets and the other students would come in and talk about how they had done the problems, but nobody would talk to me. I would always put a cover sheet on my problem sets. What would happen is that the grade would be written on the cover sheet. So when they saw that I was getting 50 out of 50, 49 out of 50, basically 98%, 100%, 95%—then they would come talk to me, but only about a specific problem that they couldn't get. They would never generally

invite me into their space—only when we were talking about some specific problem.

So it was never a full-fledged being part of the group. And that was true, by and large, in my class, even though my class had the highest number of women physics majors that MIT had ever had. So, it was very much this limited interaction. If they talked to me at all, it was about a specific thing that I would know, but not part of the general studies. It was difficult to be invited generally into the study groups, so I basically worked alone. I'd say that was definitely true through the bulk of my undergraduate years. Other than the work I did in the metallurgy and materials science lab, I pretty much worked on my own. When I started graduate school, it was a little bit different partly because there were some different students coming in from other institutions. But even then, by and large I worked alone. I did get to know Ronald Mickens, who was a post-doc at MIT when I was beginning grad school. He and I would work on physics calculations together, and I would discuss some problems with him. But most of my interactions with black students really were more where I was the senior person, because most of the influx of black students came after me. That meant that those who were undergraduates were undergraduates after me, those who were graduate students were graduate students after me.

Could you say a little about Ron McNair, since he's such a significant force in our history at MIT? I know you and he knew each other very well.

Ron McNair was an undergraduate, as you know, at North Carolina A & T. But MIT had a program where it would bring a couple of black students from HBCU's to come during their junior year to spend a semester at MIT. They'd get a sense of MIT, and this was again part of this general thrust of trying to open the Institute up more. The idea was to get really outstanding black students from HBCU's, and have them come up and spend a semester and see what it was like. And then the opportunities might exist for them to come back to graduate school.

So Ron McNair came, I believe, in the spring semester of 1970. In fact, I met him at Logan Airport. I went to pick him up there. That's how I got to know him, through that time on the campus, so I was the first—or one of the first—MIT

people that he met coming into Boston. He and I kind of stayed in touch that year, that semester, but when he came back—I believe it was the fall of 1971, as a graduate student—that’s when he and I used to interact more strongly because there was a group of black students, both in physics and chemistry; chemistry students were taking certain physics or physical chemistry courses. I had, by that time, an apartment off campus. They would actually come to my house to study. I would lend them, or let them copy or take, my previous problem sets because they were tracking through those courses a year or two or three after I had gone through them. Ron, in particular, used to come and study. Literally, I would be doing calculations related to my thesis research, and he would be there in another room studying for hours. I would lend him old problem sets. Any time he had any questions about what he was working on, he would come and ask me a question, we would go over the material, and then he’d go back to work. He would do this typically at least once a week, and particularly leading up to when he was taking exams.

So, we spent a lot of time together like this. I also did that with other students, but not as strongly probably as with Ron. Then I remember when Ron was working on his thesis, he was mugged on his way home one night, lost his briefcase, and he had to reconstruct it in a very short time. And he did that. I’d say the combination of the way I saw him studying and going at things, when he would come and work at my house; and working with me—coupled with that reconstruction he had to do with his research results in a fairly short period of time in order to start to write—shows just how motivated he really was.

Then when he went off after his doctorate and particularly once he was in the astronaut program, we would talk from time to time about some things he was going through. I did talk with him briefly just before he went up in the Space Shuttle *Challenger*, and we were talking—and I didn’t even remember talking to him about that flight. But then when I heard that the space shuttle had blown up—I was standing near a Xerox machine at Bell Labs, somebody came and told me—then without even confirming it, I knew that Ron was on that space shuttle. So that’s the scene.

I told you I had gone out to Cleveland and Detroit to recruit students, and one of the students

whom I met in Cleveland was Curtis Morrow. I remember having a pretty spirited discussion with Curt as to why I felt he ought to come to MIT. He was very hesitant, but I pressed him pretty hard. I was very pleased when he in fact decided to come. I probably knew a lot of the students in the class of ’73, because they were students many of whom I helped to recruit but also worked with during that first Interphase. I’m thinking of people like Michael Fant, who is now a physician; Jim Gates, who was my student in physics class in the first Interphase; I’ve already mentioned Curt and Beverly Morrow—and they too were people who studied with me and we would talk things over. Syvila Weatherford, from California—I remember she came and I met her mother with her when she first came to MIT. Her mother was very concerned and when she met me I think that helped allay some of her concerns. I told her I would look out for Syvila. In fact, whenever I would go to California I would make a point of going by to see Syvila and her mother.

If you look at the list of names that you have according to the years, they tell a story even of themselves. You had the threesies-fivesies, and if you look through—this is what struck me—when I was an undergrad there were on the order of a handful of black students, and I notice that under the class of ’68 you have six. Two of them are African students, and four are African-American students. And that was kind of the way it went until really around the class of ’73. That’s when you see a big jump, and the class of ’72 a little bit more of a jump—because that was when Project Epsilon had occurred. In addition, in some ways we made a little more progress earlier on with some of the graduate students, because if I look again at some of the names these were people who came to MIT in certain graduate programs as opposed to being undergraduates. They were all part of the crowd, obviously, but these are people who have gone on to significance in their own right, such as Harvey Gantt who was there in architecture. I know Harvey pretty well. And Charlie Kidwell. Jim Bishop was working on his Ph.D. at the time. He was one of the first black administrators. Linda Sharpe. Now Linda Sharpe and I—there was another interesting thing of people, to some extent, pushing us together. But we felt we came from very different places, so originally we kind of stayed apart, but then afterwards

Linda came around and wanted to pledge the Deltas. I remember that shocked me to death. As you know, Linda and I are now quite good friends. And Bennie Ward. He went through MIT in two majors, straight A's, then went to Princeton and finished in no time flat. He was in the class of 1970. Sekazi Mtwinga. Sekazi was a good friend of mine. I knew these people in different forms, different times—I'm just looking at some of the names. In the class of '73, particularly, there was Lyman Alexander, Elliott Borden, Greg Chisholm, Quaco Cloutterbuck, Darryl Dawson, Michael Fant, Jim Gates.

Those were all of your group.

All of my group. John Mack, Beverly and Curt Morrow, Paula Waters, Syvila Weatherford. Curt and Beverly own part of McDonald's. McDonald's, the McDonald's.

The McDonald's, right? It's really unique.

Frederick Sears, that's another good friend of mine.

He's in North Carolina.

Also, you know, a lot of these people are spectacular successes. Each of these people is unique in his own way. Jim Turner was very much involved with the early Black Student Union. I think he's kind of an unsung hero. People didn't know who he was. He had graduated by the time a lot of the students who were the beneficiaries of the early activities came in. And so many people tend to remember the later Black Student Union co-chairs and the like. Jim was an early co-chair of the Black Student Union, and very much involved in the push and was a member of the Task Force on Educational Opportunity. In many ways, he and I were kind of at a pressure point where there were black students who were more angry about things and not totally happy with the task force process. Yet you had people like Paul Gray who were really pushing on their side an institution that maybe wasn't quite ready for all of these changes.

There's another interesting thing on this list in the class of 1960, there's a Mr. K. O. J. Evans-Lutterodt. That is Kenneth Evans-Lutterodt's father. Ken Evans-Lutterodt works at Bell Labs. His father was the one in the class of 1960, and Ken himself got a Ph.D. from MIT, I think in the '90s.

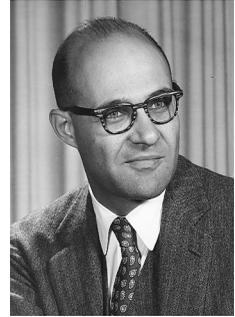

We'll have to look him up. That's unique, you know. This is the kind of people I want to try to get to. There are some other people, like the Powells, for example. I think Ken was there when Jim Williams was there.

Oh yes, Adam Clayton Powell III. Jenny and I used to have these parties up in the penthouse at McCormick Hall. We would put our little money together and get a few of the freshmen, take our little record player that only played 45's, and have these parties and try to get the—we'd call them in those days "the Negro students" at MIT—and some of them came, including Jim Williams. We would do this maybe once or twice a year, have Charlie Kidwell and some others come. There weren't a whole lot of people to choose from, but we did what we could.

One other message—this is a follow-on to my earlier comments about how I've tried to live my life—is that I think that what a lot of people don't appreciate about me, which is why I am here today, is that I was carrying on my career, both academic career and later professional career, even as I was trying to move things along at MIT vis-à-vis African-Americans, both students and faculty. And I managed to do it.

LEON TRILLING

b. 1924, BS 1944 (mechanical engineering), MS 1946 (aeronautics), EAA 1947 (aeronautics and astronautics), PhD 1948 (aeronautics) California Institute of Technology; joined the MIT staff in 1951 as a research associate; appointed to the faculty in aeronautical engineering in 1954; professor of aeronautics and astronautics, 1962-1994; emeritus, 1994- ; head, Fluid Dynamics Research Laboratory, 1956-1975; also taught in Program in Science, Technology, and Society; active with MITES program (Minority Introduction to Engineering and Science); chair, Committee on Undergraduate Admissions and Financial Aid, 1970-1974; president and founding member, Metco, 1959-1963; member, Council for Educational Opportunity, 1966-1970.

I was born in 1924 in Poland in a small town called Bialystok. My father was a reasonably affluent textile manufacturer, and a man of great energy and wisdom. I had two brothers, half-brothers—same father, different mother—who are considerably older than I am. After my father's first wife died, he remarried, and as a matter of fact, I have a nephew who is slighter older than I am and another one who is six years younger. It was a fairly close-knit family.

In 1932, my father decided that to be on the west side of Germany for Polish Jews was likely to be a lot safer than to remain in Poland. Most of our family moved to France in 1932 and lived there, went to school there, in a more or less straightforward way until 1940. When France was overrun by the Germans, we had to leave in a hurry. We first stopped off in Portugal. That was more or less the standard route for refugees. Then we had to try to make our way further west. This turned out not to be easy. The Americans were not particularly free with visas and we were looking for likelier places to go. Interestingly, we ended up going to Cuba. The government was run at that time by the same Batista who ran it again about twenty or thirty years later. It was a fairly corrupt society. In fact, we got into Cuba by buying a visa essentially, but it was a safe place to wait our turn for entry into the United States.

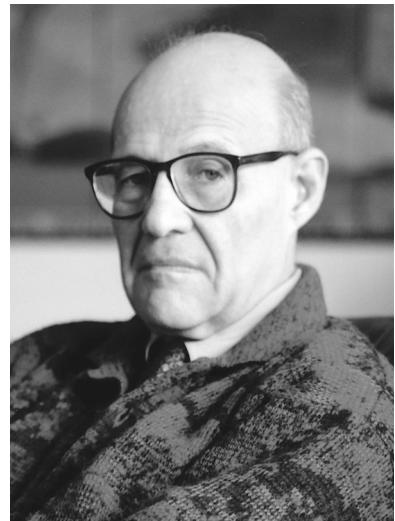

My nephew and I entered the United States as students in October 1940. My parents and my brother followed about a year later. I attended Illinois Tech for a year because, on the short notice that was available then, that was the only place that

would have me. I transferred to Caltech the following year, and did most of my higher education at Caltech. After I graduated from Caltech in 1944, I went to work for the U.S. Navy and worked for two or three years for Naval Ordnance Test Station, testing airborne rockets and the like. I then went back to graduate school and completed graduate school in '48. On the way, I got married in '46. Last February was our fiftieth anniversary.

At any rate, I got my doctoral degree in '48, stayed on for a post-doc at Caltech, spent a post-doc in Paris, and wrote lots of applications from Paris. MIT offered me a job, so I came in '51 and I have been here ever since. So that part is straightforward.

Could you say a little bit more about how you chose your career?

I think that also is interesting, at least to me in

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with Leon Trilling in Cambridge, Massachusetts, 8 March 1996.

retrospect. I was quite interested in the humanities, specifically in history and political science. I discussed with my father the notion of making a career in this field—this was still in France. My father said, “Look, for Polish Jews like us, a career in political science or politics in France is not a good prospect. I urge you very much to read history, study history all you want. I encourage all that, but try to pick a career for yourself that you can carry in your head.”

This had a great deal to do with my selecting engineering as a career. I was interested in airplanes, I happened to be in aeronautics, but this notion that—particularly for a person who does not have solid roots any place—to carry one’s career in one’s head is something that I often remember with gratitude, I must say. As I said, my father was a very wise man.

My other interest sort of caught up with me once in a while. I served on the Brookline School Committee for ten years and I have remained interested in politics. I suppose to some degree, the interest that I have had in the difference between the promise and the accomplishments of the idea of equal opportunity is in part a reflection of this interest of mine. I must add here that when I came to the United States, I was received most openly and hospitably. It was clear to me that, so as far as I could tell, there were no barriers to my advancement. I always considered this equality of opportunity that I personally experienced as one of the wonderful aspects of American society. As I began to look around me, I realized that equality of opportunity was offered to white immigrants from Europe—even Jews. The same did not seem to be true for parts of the American community, African-Americans in particular, and I felt it was a terrible shame and a blot on the image I had of this country. I felt it was probably appropriate to attempt to do something about it.

This crystallized particularly in 1961 or 1962, at the time when Louise Day Hicks was running for School Committee or was on the School Committee, and Arthur Gartland was the only member of the Boston School Committee supporting Project Exodus and other activities to reduce the discrimination and the isolation of black school children in Boston. Arthur Gartland lost the election and was replaced by a man named John McDonough who had been supported by Louise, and she expected that he would support

her. Shortly thereafter, I attended a meeting of the fair housing groups in Boston.

I should say that shortly before that, some citizens of Brookline associated with the American Friends Service Committee, which invited students from abroad to spend a high-school year with an American family and promoted exchanges, asked me as a member of the school committee whether I thought it might make sense, this year particularly, to invite one of several high-school students from the South—black ones—to Brookline. At first I thought it made sense, and then when I thought a little bit more about it, it seemed to me that we had a problem of the same sort much closer at hand, and why not invite black students from Boston? This was kind of the first notion of the Metco program, which I’m glad to say went very well, and this was one of the things that I did that I’m reasonably pleased with in retrospect.

That program has been very influential over a number of years.

Yes, it has celebrated its thirtieth year.

And you were active with Metco from 1967 to 1970.

Yes, I was the first president. Mel King and Paul Parks and, of course, Ruth Batson were the proponents of this idea in the black community in Boston, and the Brookline School Committee and Lexington, Newton, Arlington, and Wellesley supported it from the beginning. Among the leading figures here, Laya Wiesner was quite influential.

I didn’t know she was involved in that.

Oh yes, she was also a founding member. She and Paul Parks were vice presidents when I was president. At any rate, the notion of the program was that something really needed to be done immediately. In a sense as a token of good faith, we realized that the numbers were not going ever to be so large as to make a systemic impact, but they could make an impact for a number of young people, which I think they probably did. We also hoped that this would stimulate the Boston schools to re-examine their policies—both their racial placement policies and, more broadly, their educational policies—as they saw that the kids who went to the suburbs did better at college admissions and so on than their own graduates.

Unfortunately, Metco did not have that effect. We are still struggling with that one. But so

it goes. I think we started with 225 kids, and now the number is on the order of 3,000 or so—between 3,000 and 3,500.

That is a major program that has had a tremendous effect.

Well, it did have an effect on suburban school systems. Being faced with these young people who were strange or with special problems—busing being not the smallest, but possibly not the largest of their problems—conscientious school people, school administrators, and teachers began to ask themselves how to make these kids feel more at home, what services needed to be provided to them. A larger number of black teachers were hired—not terribly much more, but some more—black guidance personnel were hired, tutoring facilities were established. We organized a program which would give responsibility for every child in the program to a parent—a pair of parents of a buddy child, so that there was someone that the child could turn to during the day if there was an emergency, if he or she got sick or injured in sports, if he or she wanted to stay beyond the time of the bus because of extracurricular activity involvement, and so on. We hoped that between the host parents and biological parents, there would form some bonds and that this would also bring the two communities closer together. This worked reasonably well at the beginning and I think, eventually, it became a routine that lost its focus. I don't know what situation that part of the program is in now.

Could you talk a little bit about your impression of your early stay at MIT as a faculty member—particularly as it related to race relations, the early assessment of the black presence throughout the Institute?

Well, to be fair, until the early 1960s—after a dozen years or so—I hardly gave it much thought. There were very few blacks on campus, and I wondered but not intensely enough to do very much about it. I think at that time the absence of women was a more obvious focus for me—in part, I suppose, because it was easier to think in those terms. It was only after the events that I have mentioned with the situation in Boston—I should be ashamed of this—that it struck me all of a sudden that something ought to be done about the absence of minorities at MIT, this notion that 85 percent of the students and 95 percent of the faculty were white males.

I must say that my department was extremely supportive once my colleagues, particularly my department head, Stark Draper, became aware that this was a serious matter for me, that I saw this as an important part of my responsibility as a faculty member. They made it possible for me to pursue this. They made time available. Occasionally, colleagues would teach my classes when I had to go to some meeting which was important, where my presence was considered important. Generally, both Stark Draper and my colleagues in the aero department were extremely supportive. Holt Ashley in particular gave very strong support, still one of my close friends. He went to Stanford after a while.

As you went through college and in turn your graduate program, and as a young faculty member during those periods, do you recall any role models or mentors in your studies and in your career, particularly MIT role models?

Well, Stark Draper. He probably was the most important influence on me, in a number of ways. Intellectually, he made me less of a theoretician. He had his feet firmly planted on the ground. He conveyed to me not by speeches but by example, by success of his own work in that style, that a simple model is often extremely useful to get a problem started off the ground and practical results in a finite period of time are important. He was also quite broad-minded about people, about encouraging people who disagreed with him, and he was very clear about promoting the role of MIT as one of the locations where national defense research was carried out, at the Instrumentation Lab in the form of an internship for future engineers in high-tech defense-oriented careers. He also accepted the notion that some people would not agree with this and supported the scientific and career endeavors of those who opposed these points of view. In this respect, he was extremely broad-minded and that was an object lesson.

How did you meet him?

He was my department head. I met him in the normal course of events as my department head. I suppose you know that J. J. is doing a thesis at Harvard on how young faculty become acculturated to their departments. Well, mine was watching Stark Draper, to a very large degree. There was nothing formal done, but he was such a strong person and such a fascinating example that one learned a lot just by being around him.

What have you liked best and least about MIT's effort to increase the black presence on campus? That's a very important question—particularly to you, because you have seen it from different dimensions.

The decision deliberately as a matter of Institute policy to increase the number of black undergraduates first, and then black graduate students and faculty, was quite crucial. The way in which it was done, I think, on the whole was wise and required a substantial amount of courage on the part of the administration. As I see it, there were three components to it. One was to redefine or stretch or modify admissions requirements and admit all minority students whose high school record indicated that the chances were that they could make it at MIT. This was a slightly less competitive and stringent requirement than the requirement put on the more traditional students.

That was one part. The notion of creating a support system was the second step. It was realized, I think over a period of two or three years, that it was neither fair nor reasonable to admit these young people, given the state of affairs at the time, and expect them to make it like everybody else, since they did not come with the same academic or psychological preparation that everybody else had. Therefore, projects such as Interphase and tutoring and eventually the establishment of the Office of Minority Education were a necessary complement to the admissions policy.

The third step, which I am ambiguous about in my own mind, has to do with the living arrangements for minority students—Chocolate City and that sort of thing. Frankly, I would have preferred to see more mixing, but I guess I realized that if the young people involved were reluctant to mix, felt uncomfortable mixing, there was no point in forcing the issue. So I am saddened by it in a way. I think it's too bad, but I guess I accept it. I hope that gradually it gets to change.

I should also add that I very much respect the administration for resisting the complaints—sometimes loud—of alumni and the like, particularly those alumni whose children were not admitted. I have seen some letters of that sort and the administration deserves a great deal of credit for having stuck to their policy in spite of these complaints—trying to explain the policy, but not budging from it. I think that was quite admirable.

I think the early first few groups of black students played a very important part. I remember

tensions between the black students who wanted very massive change. I remember these tensions and there was one incident in particular that I remember. It had to do with the Faculty Club and Bill Morrison, who was a former naval officer who ran the faculty club as he would the officer's mess of a ship. He got into a conflict with some of his staff, some of whom were female and black, I guess. The black students occupied the Faculty Club and Morrison resigned under pressure.

So there were all kinds of tensions like that. Al Hill and Jerry Wiesner and Paul Gray, particularly, were able to prevent these things from getting out of hand, and I think probably the students themselves. Actually, in the end, in a manner which did not push these confrontations to irreparable extremes, the Office of Minority Education, I guess, was one of the outcomes of these tensions. Things were hard to do, but in the end they got done, so that's good. The tensions between the students and the Institute—the faculty more than the administration, I suppose—were exacerbated by the fact that this was also the time when there was the civil rights struggle and the Vietnam War struggle, all of which kind of overlapped and fed on each other. It was a very interesting time. In a way, it was helpful because substantial numbers of idealistic and politically left-inclined students made common cause with the black students as a matter of principle, and this helped the transition. But it was a somewhat hectic time.

Now another point which has concerned me. It is, I believe, a fact that while black students graduate at almost the same rate as mainstream students—the difference is quite small, I believe, maybe 5 or 10 percentage points, something like 80 compared to 85 or 77 compared to 85, or something like that, I don't have the numbers—it is believed by the faculty that their average grade point is lower by either one point or at least half a point. The faculty finds it very difficult to get straight statistical information, reliable statistical information. That is a cause of misunderstanding and suspicion, in the long run probably not helpful, which I wish there were a way of getting around. I understand the sensitivities. I understand that one doesn't want to give ammunition to those who would say that these students are in some sense inferior, and the students particularly would feel strongly about that, I'm sure. On the other hand, the fact that it is so hard to get the

information reinforces the suspicions of some of the faculty, and that is not terribly helpful. So there is a difficult point here that I wanted to mention, and that has been over a number of years, of course.

If I may come back and look at your actual department, over the years—particularly since the 1970s—what has been the presence of blacks on the faculty? Could you elaborate what accounts for the visibility or lack of visibility of black faculty members?

Of course, we have two outstanding successes, namely Wes Harris and Dan Hastings. Otherwise, it has indeed been difficult. Jim Hubbard was appointed and didn't make tenure. I think Woody Whitlow had what it takes to be an MIT faculty member, but he chose to go to NASA after he got his doctoral degree. There is a man at the Lincoln Lab named Kornegay whom we approached.

Wade Kornegay.

We approached him, and he said he was happy at Lincoln. He was certainly making more money, I think, than we could pay him. I don't know how important that was, but he had his professional life settled there and he did not accept the appointment we were ready to offer him.

Do you remember about what year that was?

One of the problems as one ages is that it gets to be a kind of a gray fog, but I would imagine it was in the '70s, in the middle '70s sometime.

You mention two or three black faculty members here in your department, over maybe two or three decades. That may sound like a small number, but when you look at the departments around the Institute, it's not so small.

It's no worse than other departments.

Exactly. I think it's better, with the exception of physics. There aren't many departments that could say they have had two, certainly at the present time if you look at the fourteen black faculty members.

Two out of fourteen is more than our fraction of the total faculty, I'm sure. But when one deals with the law of small numbers here, I don't know how significant that really is.

Well, maybe not. But the fact is that you are talking about two tenured faculty members over that period of time. That is significant in a sense because when you look throughout the Institute, you can name what departments have had black faculty members and also those

that have maintained the support for them to become tenured faculty members.

These two, of course, are outstanding people, and they would have made tenure no matter where they came from and no matter what color skin they had. It was quite obvious from the beginning that Dan is scientifically fairly close to the genius class, outstanding. Wes is fully as able as most full professors in the department and has a moral stature which is quite special, quite outstanding. He is a man of extremely high principle and seriousness. I think those two would have made it no matter what. We were just lucky in stumbling upon them. I guess we identified Dan as a graduate student here, but Wes we recruited from the outside.

I know there is something special about some of the activities and relationships that you have. Could you reflect on the nature of your relationship with these young, black professionals here? The reason why I want to keep you there for a little while is because I believe there is something special that you can convey that we may be able to gain from in terms of how you have been able to relate to, say, this young faculty member coming up—what it did for you, what it did for them—from your perspective.

My involvement with Wes is somewhat special, and it's closer than with Dan. I first met Wes in 1968. Harold Wachman and I were running an international meeting here in rarefied gas dynamics and Wes was a graduate student at Princeton. He gave a paper—which was a very good paper—and this kind of stuck in my memory. We hit it off personally pretty much from the beginning. Then Wes went on, as you know, first to Virginia and then to Southern University. I thought he would be a very good candidate for MIT, so I persuaded the department to invite him as a visiting professor. He impressed the rest of the department and he stuck. His office was next to my office. We were both early risers, so we would both be there sometime between 8:00 and 8:15, and quite often—either in his office or in my office—we would chat about politics, about minorities at MIT, about careers, about scientific problems that we were both interested in, and it got to be a completely casual and mutually helpful relationship.

At the beginning at least, Wes would ask my advice about how this or that operates at MIT because he was new and I had been here for some time. That was a fairly natural thing. Gradually, of

course, he found his sea legs and we got to talking on a sharing basis. I remember his role as director of the Office of Minority Education, and I remember how he came to see me one day and said, "Look, I spend a great deal of time doing what is expected of a black faculty member. I don't want to be the best black aerodynamicist. I want to be an aerodynamicist of world class, regardless of black or white, so I'm going to resign from the Office of Minority Education and make it as a scholar." I told him that's wonderful, so he said, "All right, would you take over for me?" It's that kind of relationship.

You know, we would go to concerts and things together and shared information and concerns about our children who were roughly at the same age and going through comparable tribulations. Wes was one of the participants in our wedding anniversary celebration. We remained close friends. But I must say, Wes has impressed everybody in the department, and people who are not generally supportive of affirmative action are actively supporting Wes as a candidate for department head. So people recognize his substance.

Dan, I don't need to say very much about. He had the same office that Wes used to have, next door to me, and we also talked a fair amount. But I think Dan is so able and has so many different interests that he struck out on his own in a field which is not really my field scientifically. He made his career on his merit by himself. I supported him and gave him whatever advice he chose to ask me for. But it wasn't quite the same relationship I had with Wes. I think in both cases it was important that we thought of each other, and treated each other quite explicitly as colleague to colleague without any hint of attention in this respect of black or white.

Let me say something else that comes to mind. I have had a number of black advisees—undergraduates—and I supported a number of them who had the academic credentials to go to graduate school here and chose to go to graduate school elsewhere. I could never get them to say that they were uncomfortable here, but I got that sense. In particular, I remember a young man named Bankhead. He was about 4.0, something like that. He was not only my advisee, but he became my freshman associate advisor and did very well at it—arranged tours to the aquarium,

and one thing and another for our freshmen—and eventually got a double degree in aero and political science. He went West, I forget which western university. I got the feeling that something had turned him off. He was not completely at ease, and I think I observed this with one or two other advisees. You know, it's hard to pick up these things. It's hard to be very specific about it. It's just a feeling that I have.

You've had a chance to actually counsel and advise students from all backgrounds, and you also have done the same things in terms of being a mentor for a number of young faculty members, from whatever backgrounds. Have you learned any general approaches to working successfully with or advising students—as well as these young faculty members, particularly these young faculty members? Have you seen any notable differences in working with young black faculty members?

Well, my approach always has been to encourage them to do what they want to do and be as supportive as I could. I thought if they did something terrible I would say so, and the fact that I had encouraged them in those things up to that time would make them at least listen. But this notion that they should do their thing—and that I give a small hint, and no more than that, and let them be on their own—I think in the long run worked out well. After all, the young people who come here are pretty strong-minded and know what they want. One shouldn't tell them what research they ought to do. One ought to encourage them to do what they want to do, support them, and open doors for them if that is appropriate, which at MIT after admissions isn't usually crucial.

The same applies to graduate students. Let graduate students be on their own. Meet with them every other week maybe, not more often than that. I encourage them. In fact, it used to be the pattern that there was a large room in which our graduate students were together and they would learn more from each other than they would from the faculty by working together. Somehow, that usually worked well. I think my guideline is to be as approachable as possible, as open and available as possible, and to be supportive but not directive. If there is anything administrative that I can do, if there is information that I can give about opportunities at other places, of course I would do that. I think I have never treated minority students or foreign students in

any other way than I speak to the other students. I hope they get that sense. I know some have from interactions with them. But I think that would be the answer.

Now, why we have so few in science and engineering, I don't know how attractive it is to choose that career. You would have more sensitivity to this than I would, of course. But I think it would be a little bit "far out." To be a lawyer or social worker or community leader is a more direct way of helping one's community. I thought that might have something to do with it, and then the abysmal state of the teaching of math and science in urban high schools is obviously another.

True. There are many reasons for you to have such a good sensitivity to this whole issue of the black experience—because of your own background, in a way. From all of your experience, what would you suggest could possibly be ways to improve and enhance the experiences of blacks at MIT, if you were looking down the road at the next ten to twenty-five years? What advice would you give the institution in terms of how the experience can be enhanced here for black students and black faculty?

This place has changed a lot already since I came here, so the Institute must have done something right. And the demographics have helped. I think the crucial thing is more black faculty. How you get more black faculty is a very difficult problem. All of the department heads that you talk to—I suppose you have talked to more of them than I have—will tell you they would dearly love to have more black faculty members, but there is competition, and there is complication, and this, that, and the other. It is difficult. In the end, the old criteria prevail over the new criteria. This is certainly true in mathematics, which has such easily defined criteria, and it is least the case in some fields of engineering and urban planning where it is obvious that part of merit, part of the quality of a professional, is his own ability to deal with a broad clientele which includes minority people.

Therefore, to be a minority is, in some respects and up to a point, an advantage. I think urban studies, in particular, has seen this and has acted on the notion that it is desirable to have larger numbers of blacks, because the practice in the profession of urban planning serves the black community and one needs to understand one's plights. Mel King, Phil Clay, and so forth have gone a long way in that direction.

But when you look at the faculty aspect and at the experiences you have with students, what have you learned that may help us duplicate things like that? I want to push that because although it may not seem like much, the fact is that it is not duplicated very much at all. Your relationship, for example, with a young faculty member like Wes is not a typical situation. I mean, it is rare. It shouldn't be.

It shouldn't be. Being aware of able young people at an early age and trying to attract them, I suppose, is important. In this respect, the various lists and registers of minority, particularly junior, faculty members are very useful. To the degree that one can, I guess one ought to get to know them as individuals, go beyond the written form of record that one would put in the book and get to know them as people. To some degree, this is a responsibility of the members of the various departments—inviting some of the more promising people to give lectures. The opportunities offered by the Martin Luther King visiting professorships are very useful in this respect. If we can retain some of these folks, that would be very nice.

I think that on the whole STS has done not so badly either. Originally, they attracted Ken Manning. He was just getting his doctoral degree in the history of mathematics at Harvard, and he has made his way here. Now they have this young lady, Evelyn Hammonds, who seems to be an impressive scholar. I think the students that STS attracts are a very widely varied group. I think they are trying quite hard to do the right thing there with some success.

What do you think has caused that?

It's the conscious willingness to make an effort. Ken Keniston wanted to do it and Roe Smith wants to do it. If the senior members of the department want to do it, at least the attempt is made. They have a quite large number of women on their faculty, but that is a slightly different matter.

It says a lot, though.

Yes, they're willing to be open. A number of their women are really absolutely first-rate. You can talk about Sherry Turkle, Evelyn Fox Keller, or Lily Kay. They are very good.

Now, was Walter Rosenblith connected with that group? I guess not. I think he was encouraging from the sidelines, but he was already—what shall I say?—a figure in the background. He was not making the

decisions. He made his views known, but wasn't making the decisions. I think the key people probably were Roe Smith, Ken Keniston, and probably Loren Graham. They are a wonderful bunch of people.

Absolutely. You see it in their scholarship as well.

Yes, yes. So to come back to your original question, it is trying to get to know the potential candidates who are available and drawing them here for visits, making MIT seem attractive to them, and I guess building support for their appointments within the department. That's done by their coming and impressing the people favorably. Growing your own graduate students is the other way. That's a longer range proposition, and that hasn't worked terribly well on the whole.

Why not?

I don't know, other than to give the easy obvious answers like competition with jobs at an early stage, and opportunity to earn an income and repay one's debts, and that kind of thing. I don't really know. I was for a number of years a member of the departmental affirmative action committee, and as such I was involved in trying to recruit graduate students. It was hard going. There were more Hispanic graduate students than blacks, as a matter of fact, that we were able to attract. The blacks we attracted—and maybe there is a lesson in this—a number of them were African, from Nigeria, from Kenya. Some of them have done quite well. There are two or three who are doctoral candidates in the department now, and Ike Colbert was very generous in providing financial support for them. The Institute probably wants home-grown ones as well as African ones—not that we object to African ones, but we would like some home-grown ones.

JENNIFER N. RUDD

b. 1946, SB 1968 (life sciences) MIT, MD 1976 New Jersey Medical School (NJMS); resident in internal medicine, NJMS, 1976-1979; emergency room physician, 1980 & 1982-1983, and employee health physician, 1982, United Hospitals Medical Center (UHMC), Newark; consulting gastroenterologist, North Jersey Community Union Clinic, 1984-1987; various ongoing staff appointments since 1983, including at United Healthcare Systems (formerly UHMC), East Orange General Hospital, and Roseland Surgery Center; clinical instructor in medicine, NJMS; member, Minority Women's Affirmative Action Coalition, Newark, 1981-1982.

I'm from Peoria, Illinois, and I'm the second of nine children. My parents were originally from southern Illinois. We settled in Peoria because my father, after being in the service, was able to have his college education paid for on the GI bill. He was delayed in entering the University of Illinois because of some problem, so he went to Peoria where there is this school called Bradley University. He was at Bradley University. That's where we ended up living. I went to public school. We lived on sort of the outskirts of town in a little black community near the public stadium. My father was an architectural engineer, one of the few black engineers in Illinois. That was an interesting experience.

Particularly at that time.
Yes, that's right.

What years are you talking about, approximately?

I remember he was in school when I was born in 1946, so I guess he graduated maybe a year or two after that in architectural engineering. They had a program parallel to the Tuskegee Airmen, by the way, for engineers, that was based at Prairie View College in Texas and that recruited talented young people from the armed forces—the Army, in this case—and collected them there. My father had some very interesting stories to tell about the fantastic individuals he met in that program. He was a communications engineer/radio operator in the Army, so he was able to go to college.

In any case, we lived on the outskirts of town and as a benefit of that, I guess, I went to the suburban high school, which was clearly the best

physical plant and had the best teachers and the best programs in the area. So I did go to a very good public high school. When I was in high school, my mother became ill with cancer and we took turns caring for her. She died over a fairly short period of time. She became ill in January and passed on by June. So, we had taken turns taking time off from school to spend with her. One of the things my father told me was, "You need to go to college and find a cure for cancer." So I remember thinking about doing medicine in those days and the counselors had encouraged me to do so. They said specifically, "Yes, this will give you an opportunity to help your people." I felt I was being shunted into an area that they thought was appropriate for me because I was black. So, I did everything but go into medicine at that point, which is interesting. Now, I'm a physician. But at that point,

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with Jennifer N. Rudd in Cambridge, Massachusetts, 30 April 1996.

I said, "I'll do biochemistry or something along that line."

I read a brochure about MIT, a small pamphlet. It was bigger than a pamphlet, it was a little thick brochure. I fell in love with the school on the basis of that reading. When people would ask me where I wanted to go to school, I would say, "MIT." They would laugh and I would say, "Why are they laughing? It seems like a perfectly good place to me. It seems like a very nice place." I was very fortunate because I applied and got in. I think there were many students in my high school who were in the honors program with me who had applied there. I was the only one who was accepted, though. So I was pretty lucky. There was another fellow in my class who got into Harvard and had come. I saw him a few times while we were here.

How large was your high school class?

I'm trying to think now, but I think there were about eighteen hundred students in the whole school, if I have that correct. So, it was a pretty good size.

How many, approximately, black students were in your class?

My elementary school, because of the segregated housing in those times, was the only school that fed blacks into the high school. Those were people who lived within a few blocks of my house. So there were about twenty-five blacks, all of whom came from the one elementary school. The other black students in my class went to elementary school with me.

So all of you knew each other.

Yes. I think maybe out of seven or eight students who entered ninth grade, about four or five of us graduated. Many of the girls fell by the wayside with premature pregnancy, that sort of thing. I was the only black in the honors curriculum.

So, essentially you did exceedingly well while you were in high school

Yes.

The high school, as I understand it, was clearly very predominantly white.

Right.

Did you have any teachers who stand out in your mind as role models or mentors of any kind?

I don't recall having a single black teacher in elementary school or high school. My favorite high

school teacher was my math teacher, who I had for four years—Mr. Moser, who was trained in Indiana. Another favorite teacher was my fourth-year English teacher, Ms. Rukgaber. We did some interesting things on philosophy and other things, besides just the routine grammar, that I enjoyed very much that senior year. Of course, the science teachers were fun to be around—biology, physics. But my math teacher was my favorite teacher.

You had him for four years?

Right. He taught the honors classes.

He must have been very good because you really had a good background to prepare you before you went on to college.

In those days, we got up to calculus and then we had kind of a self-taught program that required ten of us between junior and senior year to teach ourselves some calculus over the summer, which was interesting. We had a little bit of that. So, it was okay for preparation at the time. I think high schools now are beyond that even at the high school level. Unfortunately, later on, that strength in math was a major downfall and I'll tell you about that when we get to it.

That should be interesting. Now, you said that basically you found out about MIT through this brochure, for the most part, and that it was very attractive. What did you like about the brochure? Can you recall?

I don't recall specifically, but it just probably spoke in very general terms about the Institute's mission and goals and about how it was a wonderful place to go to learn and really be creative. I was just very much taken by it and I said, "That's where I want to go." I had visited the University of Illinois. That was another choice of mine on the school-sponsored tours—trips that we went on when they had the science fairs for high school students, and you'd go and spend the day. I've been on the Bradley campus locally and my older sister attended Bradley for a short time, so I had some interaction there. I probably applied there also. I don't know what it was about that brochure, but it seemed like a nice place to be. At that point, you may know, they had just built the first tower of McCormick Hall and they were very interested in increasing their women student enrollment. Prior to that, the women students lived in a few facilities across the river. They had just increased their capacity to have dormitory space for women students on campus. I

think that was a time that they were actively looking for more women students, too.

Now, this was what year?
1964.

Did you visit the campus before you actually came?

Oh, no. My first plane ride was when I left home with my bags to come to school, to MIT. It was a little propeller plane that went from Peoria to Chicago, and I cried all the way from Peoria to Chicago. I was still wiping the tears away because I was taken aback by the experience of it all—being up in a plane, my first experience in a plane.

You were courageous, though.
I guess so. It was worth it.

It's hard to forget that because this was your first plane ride.

My first time away from home. I had visited relatives in Chicago, relatives in Cleveland, and even stayed for a while in both places with them, but by auto travel. This was the first plane ride.

You went through Chicago and I assume you got a flight from Chicago to Boston, and you got here. What were the highlights of that experience with MIT that first year?

Well, even that first week was great. It was very interesting because they had a very good program for freshmen to come a few days early. That's very important, I can see, for incoming freshmen to get oriented and to have people just there to welcome you by yourselves first. Then there was the whole series of programs over the next few days to get people oriented to the campus and parents mostly bringing other students in. That's when I met Alan Gilkes, our classmate, and his mom and dad. They took us to lunch or dinner one day. I met Shirley, of course. We were on the same floor, Shirley Jackson and I. I met her in the dorm. Different events they had in the first part of the school year, to go to different dorms for social events and so on, were kind of fun. Meeting the other women students, they were something. I was very impressed with how verbal they were and how they were so aggressive in conversation. I was very naive, very shy, and didn't know really how to express myself in a group and be aggressive with anyone in groups. I was very impressed with these New York, New Jersey women. They were real bold and outspoken and forward.

Were these black students?

No. Shirley and I were the only black females, and I think there were seven other fellows in our class.

You and Shirley may have been close to the first black women to be there. Do you have any sense about that?

I don't know if there were ever any other undergraduate women, but I understand that we were the first two African-American women to graduate from MIT. Now, whether or not others took undergraduate courses, I don't know, at some point without matriculating.

Well, you are a very key person. You and Shirley are essentially the two first black African-American women to finish MIT. Have you ever thought about that?
Yes.

Tell me more.

I was surprised that I could be a first at something, you know, at that time and I just thought what a shame it was. I remember being very interested in the previous African-American students who had been there and hearing about them and what areas they went into, where they had come from. One in particular, whose name I don't recall at the moment, was one of those gifted, talented people who was not only brilliant, but also a great athlete who had been there and graduated, I think, the spring before I started in the fall. I think he played basketball. That's why we heard about him, because one of the sophomore students organized the MIT cheerleaders for the first time. This is interesting, because eleven people tried out and eleven people made it. We had something for everyone here, there's a place for everyone. Nine cheerleaders and two alternates—everybody made it. So, it was fun to go to the games and that got me interested in asking about other black students who had come through the school.

When you look back now at the undergraduate days there, reflect on the issues in your life as a black student and particularly as a black woman. There were no other people like you then.

Yes. Where to start? In a racist society, one of the horrible things that happens is that people who are oppressed buy into their own inferiority. Illinois is a lot like the South. My high school, I mentioned, was predominantly white. There it's sort of more black and white, unlike the East, where you have a lot more multicultural diversity and tolerance and

appreciation of different cultures. People have lived for maybe several generations since they immigrated and they kind of merge into that Wonder Bread and bologna white middle-America culture. They buy into the American dream and all of that sort of thing. But clearly people who are physically, visibly black stand out as exceptions. If an Asian or East Indian should come to town and wear their native garb, they'd stand out. A big thing is even made of the foreign exchange students in the high school who were Caucasian, but have accents and have interesting dress and so on. I was excluded from a lot of things in high school, such as the social dance. My father refused to allow me to sit through it, so I usually had a study hall during that time or other things where they would separate us out and take the black fellows out of their class to partner with us when we had a session in dance in gym class and that sort of thing. I came here with a lot of stains and scars of the racist experience I was growing up in, along with the juxtaposition of the poverty that we lived in next to the wealthiest people in town where we went to high school.

So when I came to MIT, contrary to some of the experiences I've heard at one of the reunions, I really found that the other students were terrific. They were terrific kids, terrific people, and open and warm. They accepted me better than I was able to accept myself. Then, not living at home anymore, having to live amongst them in fairly close proximity and seeing what they looked like and smelled like and acted like when they were themselves and so on, I think I actually got a lot more self-confidence after I came to that environment than I had before I came. There were some areas in the Institute where Shirley and I were viewed through racist eyes and we were tagged the Tweedle Dumb twins and derogatory terms like that. I think people in Admissions who do all of the calculations on predicting success and who should they admit and so on, I was insulated from. I never had an occasion to go there. I was insulated from that, thank goodness, because that might have hurt my feelings at the time.

But MIT was everything I had expected and hoped for from that little brochure, by the way. I made a number of friends amongst the other students in the dorm and in my classes. Also, there were a lot of international students and for the first

time I met a lot of students from the Continent, from various countries on the Continent. For me, that was a very broadening experience. For me, Africans who were from Africa and who had not lost their roots and who had their sense of identity and culture and heritage intact, I really liked that. I had a lot more sense of self-confidence after experiencing that, despite the fact that we were seven African-Americans out of nine hundred in my freshman class. People came from a lot of different places. It was sort of my first experience at a world view of things and multicultural diversity. Then there is a certain sense of giving people credit for having an intellect and being capable. Some students don't succeed, but it's often because of the emotional problems that they're going through and not so much because they're not expected to because of their racial background. In that sense, I actually grew at MIT compared to where I came from.

You talked about seven students. I guess it's so hard for you not to know each other.

Well, it was hard. I didn't get to know some of them very well. I had a work-study job. My work-study job was working in the libraries. I started working in the library my senior year in high school before school. When I came to MIT, my work-study job was working in Hayden Library at the circulation desk. We also had a little book of all the freshmen and I think there were upperclassmen in it. I had nothing better to do than kind of flip through the pages and look for the brown faces. People would come through and there were upperclassmen or graduate students and I'd say, "Hmmm." I would see their names when they signed out the books. So, I got to know a few people who were library studiers. I mentioned Alan because he lived a couple of dorms over from us. Eddie Rhodes was a DJ on the radio station. He played the jazz program and I was a jazz enthusiast, so I loved listening to him. I would see him occasionally on campus, but I don't recall having any classes with him. There was Danny Alexis. I think we tried studying together from time to time. I think he was in the biological and nutrition sciences major, so I saw him a bit. The other couple of fellows I can't remember right now. I think one lived across the river in a dorm and was in engineering or something. I didn't see them as often and didn't get to know them very well.

When did you decide what you would actually major in at MIT?

Well, my freshman year I was overwhelmed with the work load. I signed up for a lot of activities and was taking physical education when it wasn't required. It was a disaster because they did gymnastics, and women reach their peak when they're about fourteen in gymnastics. I had two square meals a day and gained ten pounds that first semester, and I couldn't cope with that physical demand of gymnastics in an all-male class.

I joined a lot of other things. Because I was strong in math, I didn't study my math. I kind of coasted on what I had when I came here. That was my fatal flaw, because I fell in love with physics. I really, really thoroughly enjoyed the physics and without the math as a background—that is the fundamental basis to do that—I couldn't do well in it. I did badly in my physics class. I had Philip Morrison as my recitation instructor. He was like the legend, and he was from New Jersey. I was so in awe of all of that, and he was a great, gifted, and spirited instructor. I didn't know what was going on, but I just liked listening to his lecture. I thought I wanted to do physics, but I didn't do well—didn't do that math, let that math coast while I was trying to adjust to other things. I had to make a lot of adjustments and adaptations to the new work schedule during that freshman year. I never had to work so hard and so long. As a result of that, I didn't do well in second semester freshman physics and had to repeat that course. That pretty much took me out of the physics running. I was able to regroup and had a little setback with organic chemistry, but got through that and ended up as a biology major and well on my way to being in a position to take up medicine later. That's how I ended up in biology.

So you basically maintained your interest in the idea of medicine from pre-college days.

Well, I still wasn't looking toward medicine then. I was looking toward maybe biochemistry. I was actually shocked when I found out senior year that the vast majority of my Course VII major classmates were applying to medical school. I said, "Oh, they're not doing true science or research or whatever. They're going into medicine." I was surprised by that. I went to graduate school in biology and then took a year off to go work at the Malcolm X Liberation University in Durham-Greensboro, North Carolina.

At that point, after a couple years of graduate experience, that's when I decided that maybe the laboratory wasn't for me—that I was more of a people person, that I needed to find some application of my science background that would allow me to serve the black community more directly. I said, "Oh, I don't believe this—now you're going back to exactly what you said you wouldn't do when you were in high school." So that's when I decided to look toward medical school. When I went back after my year off, I applied to medical school. When I got in, I left graduate school. I never got a graduate degree. I left graduate school to go to medical school.

I see. So really when you were going through MIT, you weren't sure about where you were going to land.
Right.

I heard that quite frequently students would mistake you for Shirley, and Shirley for you.

Isn't that amazing? We didn't think we looked anything alike. She was very, very petite and I was a little chunky. We were both kind of the same height, but other than that, I didn't think we looked anything alike. But you know, like I said, we were called the Tweedle Dumb twins at one point. After maybe freshman year, when you take so many courses together and then we sort of ended up going in different major areas and taking a different complement of courses, it wasn't a problem. The women in the dorm certainly knew who we were after one year. After that, we wouldn't really have that many classes together, so it didn't overwhelm us. It was sort of amusing to us.

Did you recall actually strong discrimination, racism so blatantly?

At MIT, no. In graduate school, yes. That's when I first came into contact with that.

Let me have you stick with the undergraduate for a couple more minutes and then we'll go on to your graduate program. On the undergraduate level, that was a very crucial period. Are there any faculty members or mentors who stood out for you during that period?

I think the person who had the biggest impact on me was my freshman advisor. His name was Ned Holt. He was a faculty person in the biology section. He had us all to the house, the whole group of us in his advisory group. I got to meet his family and his kids and so on. I remember going to him when I knew I failed that electricity and mag-

netism final. I remember going to him after that and trying to figure out what to do. Having been a strong student in elementary and high school and then getting an F for the first time in my life, boy, I really felt like dirt. I was really, really upset.

This was in your freshman year.

Yes. I didn't know what I was going to do and he was very supportive. Also, during the first semester when I saw how much I needed to adapt, I dropped all of my activities and all of my clubs and all of the other things I was in. I even dropped cheerleading. I kind of knuckled down and got into a more rigorous schedule, organized my time a lot better. He talked me through all of that. Then when I did get ready to apply to graduate school, I didn't think about going to medical school. It was kind of a surprise how many other students in my class were going to medical school. I didn't have enough confidence in myself to think that I would get in. He recommended Wesleyan, which was the undergraduate school he had come from. He was still in touch with some of the faculty there and he wrote me a nice letter of recommendation.

This is Wesleyan University.

This is Wesleyan University in Middletown, Connecticut. That's how I ended up at Wesleyan for grad school. Dr. Holt pointed me in that direction and said, "They would be pleased to have you there," that sort of thing. The sad thing is that he did pass away prematurely. That's why you don't know him. I think he died while I was in grad school, not long after I left MIT. I don't recall what it was he passed from, but it was definitely a premature death. I found out about it from the paper and newsletters and so on.

So he was a major force in terms of supporting you.

He was just very nurturing, kind of a nurturing father figure. He talked me through some difficult times and also helped me move to grad school.

When you look at graduate school, you went to Wesleyan and you were focusing on what subject?

Biochemistry.

Did you have any idea what you would do with biochemistry at that time?

After I was in college, each summer I went home to Peoria and I worked in a lab. It was called the Northern Utilization Research and Development Division of the Department of Agriculture. They had a laboratory in my hometown. The first sum-

mer after college I had gone there and gotten one of their summer jobs. So, I worked in the lab mostly doing microbiology and some other things—some biochemistry, but it was basically a microbiology section of the lab. I felt pretty much at home in the lab working there. For a short time, I had one work-study job doing solutions for the biology lab at the biology building. I just figured I would do research and that sort of thing, something in that area. Even after people in my class went on and did Ph.D's, the Ph.D's were having a hard time finding jobs. The research money and funds were drying up and, except for those who were in academia, it was getting very difficult. That was part of the reason why I switched to medicine, but not the only reason.

Wesleyan did not have a medical school. You stayed there how long?

I guess it was over the course of three years. I went there for two years, took a year off, and went back for one year during which I became pre-med. I finished the year, but I didn't finish the requirements for the degree. I found out that they were keeping people there seven years to get their degree. It was a new program. I think they didn't have a lot of self-confidence about their ability to produce Ph.D's.

I wasn't too happy with one of the biochemistry instructors' handling of my lab grade. I had come there and I had had all of the biochemistry labs at MIT, you know, that we did as graduate students. I guess he thought I was a little too carefree and jolly or lackadaisical in the laboratory, but I had had it all and I was showing the other students how to isolate the DNA and extract it and so on and get the things in. I always got A's on the lab write-ups and he gave me a B-minus or something like that in the course. I said, "I don't understand how you came up with this grade." He had averaged my lab report grades with something he called attitude, for which he had given me a C. He hadn't discussed it with me, hadn't told us there was such a thing. Then he averaged this C for attitude in with the A's and came up with a B-minus. I said, "Uh-huh, yeah, I've got your number. I will remember this." I don't understand that, how he just created this subjective grade because he just couldn't give me that A.

So that's why I said I ran into racism in graduate school. That was one example, so I didn't really feel bad. I had some other wonderful expe-

riences there in terms of African-American studies and African dance. They had a wonderful world music program and we were very active. It was a very active time in terms of students taking over buildings on campus and all sorts of things. So it was an exciting time to be there.

That was around what, '69?
'69 to '70.

They had an African house on campus at that time, too.
Yes, that's right—Afro-American House.

Did you have any experience with that particular house?
That was sort of unusual on campus.

The front was like the offices for the academic program and in the back was a black dormitory. I don't think they had frats and a black sorority or anything. It was also the time when Wesleyan was going co-ed. They had some of their first co-ed students, and I think I was a counselor for the orientation program a couple of summers. It was really an exciting time. It was a liberal arts college, quite different from MIT. I was a teaching assistant for some of the science classes as a graduate student, so I met some of the undergraduates who were pre-med. There were some very talented fellows who were there too.

That's a very good school and continues to be a very good school. Our son went there, so I'm very familiar with the school. I was very impressed with it, and still am. That house still exists and they still use it the same way, for the most part, as I understand. That was about four years ago. At the "college night" at my daughter's high school, I always go to the Wesleyan table and think, "Just say hello to whoever is there." The fellow who was there last was a Latino guy and he was saying that Fay Boulware had dropped by recently. She was a faculty person for a while and her son had gone to school during that time.

So you left there and went where?

When I left Wesleyan, that's when I went to New Jersey for medical school.

Now, who played a big role other than yourself to make that kind of move?

Well, as I mentioned, I took a year off and I went to the Malcolm X Liberation University. It started in Durham basically as an offshoot of the Duke University Black Student Organization. All of this happened after 1968, when Martin Luther King was assassinated. At MIT also, Shirley and I got

together and founded the Black Students Union as a response to Martin Luther King's assassination. We wanted to form some kind of group for black students on campus, so we could get together and do positive things.

I'm glad you mentioned that.

Yes. Just to backtrack, we forget about the kind of militancy I was getting into at MIT. I did venture off campus a few times and I remember going into Roxbury to hear LeRoi Jones give a presentation that was sort of poetry with a political message, kind of a dramatic presentation, getting the audience involved in it. I remember the line he always said about how they started picking up the black station on the radio as they drove up from Newark, and he says, "Ah, we're approaching civilization." They closed all the doors and they didn't want whites in the room.

Another time I was over in Roxbury somewhere listening to Stokely Carmichael speak while I was a student. That might have been about the time I got my afro. It was my senior year when Martin Luther King was assassinated. Malcolm had been killed my freshman year at MIT. That was in 1965. Then Martin was killed in '68. That was all during my college years. In between, my first trip to New York City was with the big anti-war rally, probably in 1967. We had a whole contingent of buses from New England. It was my first experience demonstrating in the streets, wall-to-wall people filling the UN Plaza. That was part of that whole anti-war era. Much of it got me a little bit politicized in that era. Vietnam for the Vietnamese and, later on, South Africa for the South Africans.

In any case, I left MIT right after all of that. I went to Wesleyan and they too were developing a black student organization. They had the Afro-American Institute already. We took over a building for a day and a half or so, and made certain demands that the administration capitulated on and gained some understanding of Ujumaa, we called it, the student organization on campus. Some of the students from Wesleyan had been down to Malcolm X Liberation University and had told us about it. That's who told me and that's how I found about it, that it existed. Another student from Holyoke College who was graduating a year behind me in school, a biology major, she was also going there. So we decided to go down there.

I took a year off from school, a leave of absence. I got funding to do that. It was a very interesting experience. As I mentioned, we had kind of a curriculum. We were trying to develop a school to teach skills to the community. We were trying to teach biology and chemistry to the students. A pharmacist came in and he was teaching pharmacy. I really got interested in that, the chemical applications of these pharmaceutical drugs in certain medical conditions and so on. The pharmacist was very, very nice and very supportive.

Where did he come from?

He was a pharmacist at a local pharmacy in Greensboro.

That experience was very, very invaluable to you in that period.

It was also my first experience in the South, North Carolina.

Exactly. When you look at your career, you had been in Illinois, Boston, Middletown, then North Carolina. Give some kind of assessment of the contrast between those places.

North Carolina was the first time I had been some place where I could go all day and all night and just see black folks. You go to the K-Mart and you'd be checking out behind somebody who sounded just like Gomer Pyle. It was like, "I can't believe it. He sounded just like Gomer Pyle." Basically, you just function all day long and, unless you went downtown, you really didn't come into contact with any whites. I said, "Now I see what they're talking about." It was really interesting.

It's very interesting, because I come from North Carolina, so I know during that period of time exactly what you're talking about. Did I hear you say that this pharmacist came down and talked about all of the different kinds of chemicals and formulations and all of that? Did that kind of spur you on to not only go in further with medicine, but actually to sort of specialize in something?

It didn't tell me what to specialize in. It was sort of like when I was at MIT. I didn't know what I was going to do with what I was learning there. Similarly, when I was in medical school I couldn't figure out what I should go into at all and I kind of fell into that. Otisa Barr was the student from Holyoke who was with us. We were the students, the pharmacist was the teacher. We were taking a pharmacy class. I really enjoyed it and I did well enough, you know. I think the pharmacist was

very impressed. In fact, Otisa and I are both physicians. She's a pediatrician. She's back in Washington, DC, which is her home town. I did adult medicine.

Again, I had a hard time trying to decide which specialty area of medicine to go into because I liked everything. As it turns out, the area that I applied for was one you had to apply for a year earlier than the others. I didn't realize it was a more competitive and lucrative field, gastroenterology. I didn't know that. I just applied because I knew I had to apply a year earlier and, when I got in, I went into it. We had some black faculty members at my school. A world-famous liver specialist named Carroll Moton Leevy, at the University of Medicine and Dentistry of New Jersey, was the department chairman whom I trained under. There were several others. Dr. Frank Smith and other people were in the liver section. We saw a lot of liver disease in Newark—a lot of liver disease, various kinds. I was always fascinated by that. I moved to the gastroenterology division. I applied, I was accepted, and that's how I ended up in gastroenterology. I haven't regretted it. I really enjoy the field.

I noticed that you've actually sort of stayed in that arena too—that is, in the New Jersey area.

That's not unusual. Apparently, one-third of people end up practicing in the vicinity where they're trained. Even when I came to MIT, I never met a person from New Jersey I didn't like. I liked the people. They were so friendly and open and honest and frank, just fun people. New Jersey is an interesting place. If you're not from New Jersey, you don't mind. People from New Jersey, a lot of them try to get away from New Jersey. But I was away from some place, away from Peoria and the negative memories I had about the racism. When I go back it's like going backwards in time, not just crossing the miles. Culturally, once I came East it was very difficult to go back. It's kind of a culturally less stimulating area, politically less stimulating. In the urban areas, you have to deal with a lot of other nonsense, violence and crime and so on. But you have a lot of gifted, talented, accomplished black professionals you can get to meet and interact with, and that makes up for it.

So I go back to see my folks, but I haven't yet decided to go back there to live. New Jersey will do. Then Shirley ended up in New Jersey, too.

That's amazing, that both of you ended up in New Jersey. You're in a field in medicine that clearly is a very important one, and I only know one other person who is in that field. He is at Hampton University. His name is George J. Brown. He just became a general in the army. Well actually, he was at Walter Reed Hospital. He was the physician for Chadwick. Remember the black Air Force general who died a few years back? I think his name was James Chadwick. Anyway, I understand that the training is very, very intense. Is that right?

Well, I must say that after doing biochemistry at MIT in the very beginning, I was broken in. Then, having to do a lot of those courses again in grad school before I switched to medical school, by the time I got to medical school it was the third time around for me. I got honors and I would always get the top scores in the class on the biochemistry test. Everybody thought it was so terrific. But this was the third time around for me. Again, as I mentioned, they had a very aggressive recruitment program, they had some very talented people. I think, even still, my particular class had the largest number of minority students of any class before or after. They did a good job of recruiting. They had a number of people who had done other things before they came to medical school. A mechanical engineer—he had been at MIT for a while. He was sent by his company for some training. A microbiologist and some other Ph.D's were in the class, and some other very talented people who had done some other things who weren't just out of college. We had quite a fascinating group and we were in a summer program together before we started. I had a terrific time in medical school. I enjoyed it thoroughly. I really thought it was great fun. I had to work hard once we got to internship, but I thoroughly enjoyed it. I was definitely in my element when I was in medical school. I don't regret it at all, and really found that it was the kind of field where I could be in contact with people, felt I was doing something.

There's another thing I want to talk about. The whole time I was at MIT I was on a constant guilt trip because I felt torn between leaving the campus and going out into the black community. What I wanted to do I wasn't sure, but I wanted to be involved, I wanted to be in touch, I wanted to be of service, I wanted to find out what was happening politically. I was always torn between getting involved with those things and trying to do my work, which was clearly always challenging. I

remember being down for the reunion a few years back and having one of the other people mention that he was counseling a student. The student wanted to be involved in the community, but he didn't quite know what to do. He said, "The best thing you can do for yourself and for your people right now is do a good job in these courses." It's true, but it's still very difficult to constantly be torn between wanting to take your limited energies and resources and talents, to defer that kind of involvement to immerse yourself in the black community, while you're trying to stay in your dorm and stay in the library and do your studies and work in the lab—whatever—and constantly be isolated from that source of energy and your base. Finally ending up in the medical field gives me the best of both worlds because I'm in contact with people and I get immediate gratification when I'm able to do something to help someone. The vast majority of my patients are black—African-American, Latino-American, and a small number are of Caucasian extraction. I think that worked out well for me.

Well, you know it's really important that you said that. I couldn't help but think about a young lady, just this year. I would love for her to hear your comments. She is an awfully bright young lady from Brooklyn. Her father, I think, is black, and her mother is Asian. She came and talked about exactly what you were just saying. After spending a year at MIT having to work so hard and concentrate just on her work, she was concerned that she was not going to make a commitment to her community where she felt they needed so much from her. This education in this way—all of the science and all of the math, physics, chemistry—didn't quite click with her. She was torn. We have begun to try to get her involved in some other things along with doing her work, but she's made the same identical comment that you just made. When you're going through it, evidently it's not easy to just say, "Well, I know this will eventually make a difference." That's what I hear you saying.

It's not really even enough. I understood what the person was telling that student about stressing that you do well in this subject. That's true, because you're generating that foundation for the future, you're generating your own academic record that's going to be used to limit or open up opportunities for you later. But if there were some way that people could concentrate on their schoolwork and then have some time where they felt they were in

touch with each other doing some collective political analysis of things on campus and working for some cause or having a project that they could put some effort into on the weekend or have a summer job that would allow them to do that, I think that would help round them out a little better and give them a little bit more of a purpose while they're meeting other needs at the same time.

When you really look back and you do a summary and an analysis of your perspective of the MIT experience, indicate whether that perspective evolved over the years and over time. At the present time, when you look back on it, how do you come down on that experience in terms of the value?

Well, I know that any school or college is always trying to figure out what they want to provide their graduates with, and you can't always keep up with the latest work environment or demands. What I understood from them was that they wanted to teach us how to approach a new experience, how to approach a new problem. I think they did that for me. I definitely had to be adaptable during those years. Every year I got better at it and every year the challenge was more difficult, so I continued to have to get better at it. By the time I was finished, by the time I graduated, I really think I was at my academic peak in terms of being able to handle whatever you threw at me. At that time, I had certain basic sciences and my life sciences and I had done some art history, I had done some photography, I had done a foreign language—a new foreign language. I really felt like I could have handled just about anything you threw at me at that point. I think they did that for me, to give me enough fundamental skills that are current enough in the field that I could go out and just really adapt to things. I've had to adapt a lot more, many more times during my life, and I'm adapting even now—trying to adjust to new demands in my field and trying to rise to the moment. I'm getting new skills and new credentials even now, at age fifty. I think that's what I came away with.

Based on your experience at MIT and your experience and rise so far in your career, is there any advice you might offer to any other black students, the young Jennifers coming through, beginning to come through MIT?

Well, I would say take advantage of and sample all the different things that are available for you to

experience or see or learn. Be a little bit introspective and see what it is you think you would enjoy doing. Keep an open mind.

Do you want to talk a little bit about some of the support services?

Yes, because those were really key to my MIT memories. In particular, I remember they had a program for the incoming freshman women. They had an upper-class person sort of be like your sister. Edie Goldenberg was my sophomore sister. I don't remember what Edie majored in. I won't even venture to guess right now, but she was my upper-class sister and she was also in the dorm when we came in our freshman year. I remember very importantly our two tutors, our two dorm tutors. Our physics dorm tutor was Margaret MacVicar and our math tutor was Harriet Fell. I don't know if you know Harriet. She was from New York City. She was the first person I ever heard describing a curve as "getting bitchy." She said, "Don't worry about that. After that, it gets bitchy." I said, "Oh my goodness. We're in college and you're using these curse words. Oh my goodness." She was funny, but she got right down to the nitty-gritty.

That was very critical, coming from a public high school and meeting students who had a lot of the same material at the same depth in high school, having the dorm tutors help us out, and having a whole lot of other company and having them take us by the hand and really go over some basics with us and being there and being available. I know Scottie MacVicar went on to be a very important figure in the Institute, and she also has passed on.

Yes, she has.

She was always there for support for those of us who had problems with our physics courses.

It sounds just like her. As you know, there's a fellowship, a professorship named after her for outstanding teaching, which is very appropriate.

Very appropriate. I lived in McCormick Hall my freshman year. Sophomore year, we kind of outgrew McCormick. That was before their next tower, I guess, would open. They put a few of us up in what had been a dean's home on Memorial Drive—Moore House, it was called. I think later on it became a frat, but that year they had, I forget, about fourteen or so women there. I had

roommates who weren't in my class, but they were chemistry majors. I remember them being very helpful to me when I had to drop organic chemistry and still had my lab course. At Moore House, the students were very supportive also and helped me get through chemistry. Then my third year on campus, I lived in Westgate. Again, we were outgrowing the facilities and they gave us a floor in Westgate. My roommate was Natalie Weiss. What a phenomenal individual Natalie was. From Natalie I learned how to be disciplined. Natalie was a very disciplined person. Some of my other classmates who did well academically always made sure they got eight hours of sleep, but Natalie would stay up all night if she had to. She would get her work done.

Did that rub off on you?

That definitely was a positive role model for me. I said, "Well, I'm just going to do what Natalie does. I'm going to stick with it. I'm going to keep at it until I get it done." Natalie graduated after her third year. She was so organized. She was looking forward to enjoying her senior year, but her parents said, "Oh no. We're not paying tuition for you to go just for fun." She did so well that she met all of the requirements for graduation after three years.

Was she black or white?

She was European, Jewish extraction. She was from Maryland and her father, I think, was a scientist. I forget what her mother did.

Did you ever talk to her later?

Yes. Natalie had to leave, she had to graduate. Her parents said, "You can't stay here and just play the viola now." She went to the University of Chicago, I believe, did a Ph.D. there. She said she was never going to get married, but the next time I met her was in New Jersey with her husband whom she met in Chicago. She had two little children, so we used to get together on the weekends and take the kids to the zoo. I had a daughter by then. I got together with her until they both got their degrees. That's when I knew how difficult it was for Ph.D.'s to find work. They both managed to get faculty appointments, I believe, at Duke University in North Carolina. They left New Jersey for there. I think her husband's parents were from New Jersey and that's why they settled out there. We lived in the same town in New Jersey for a while.

Those were some of my really major supports in terms of helping me develop the academic discipline I needed to tackle tough courses.

What about the offices during your time, like Student Affairs and other kinds of offices that really were there for students? Do you recall any major support from that?

I remember the major support I got from that financial aid office. I remember picking up my check from that work-study program. Also, the Student Center opened up the year before I graduated. My senior year I worked at the twenty-four-hour-a-day reading room. That was where I was working. I really enjoyed that. We were at a great location on campus because we were near the auditorium where a lot of the things are held—at Kresge and the Student Center, where a lot of activities were held. Of course, my fourth year I lived off campus. I had my own apartment with one classmate and another woman who was working.

How tough is it for a woman to be in such a demanding field?

My daughter doesn't like it because it takes a lot of time away from her. Now she's sixteen so she thinks she's grown and she doesn't really need me around anymore, but when she was in elementary school, she resented the fact that I had to be away so often. I had at one point when I finished my training thought I would have been very happy working for something like an HMO, where I had a little more scheduled hours and scheduled times off. When you're off, you're really off, then take calls in turn so as to have other time off to spend. I didn't have that opportunity when I moved into private practice. I'm still in private practice, but I understand that the environment in which we work is changing and that's an unstable situation right now—the changes in the health-care industry, the move toward integrated networks and managed care system. That's what they're saying, so I'm not sure exactly where I'll end up. But we all know that we're not going to continue to do what we're doing for very much longer, the way we do it.

That would have a tremendous impact on the private practice, I would assume.

Right. We're said to be an obsolete entity, but as long as I can continue to do what I am doing, I will continue to do so. I know that the environment is changing. The market forces are making us adjust.

Is it really changing that rapidly for our people, particularly in black and Hispanic communities?

Yes. The people who are on state and federal health-care systems are being routed into HMO's now. So we have to be within the appropriate HMO network even to continue to care for the majority of the people who are on Medicaid and Medicare. The people who are on the commercial side are becoming more and more HMO-affiliated as opposed to just getting a guaranteed plan. Those are becoming unaffordable, so they go to an HMO system, of course, and make it more affordable. Consequently, you're bound to a certain provider network. If you're not in that provider network, you basically have to wave bye-bye to your patients whom you've been treating for ten, fifteen years. People are trying to adjust. It's hard to make strategic moves when you don't understand the system. We're floundering and we're trying to understand what's going on, what's happening to us, and trying to make decisions as they come up and trying to adjust and adapt. It's interesting and I'm pretty discouraged about the whole way things are going in that area. I have made the decision to try and stay in the field, another adaptation in the making.

That sounds like the typical MIT way.

Yes, right.

Well, are there any other comments you would like to make?

Yes, I have a bone to pick. Social life—let's deal with that social life aspect of things. I hope that's better these days.

Well, it's interesting. I have about three black young women who worked in my office, sort of connected with a class they took. Just this week, the three of them were talking about social life. I didn't get the total gist of it, but it appeared that they were not pleased with it.

Right, that was a problem. There were just a few other blacks in the class and we didn't really have any organization through which we got together and did things socially, to fraternize or get into the social aspect of things. "Fellowship" is the word I wanted. Shirley and Linda Sharpe had gotten involved in the Delta Sigma Theta sorority and brought me along with them for some of their occasions. It was positive to see some of the people they met through that, which was an all-Boston, all-citywide kind of organization. That was also good because you went to other campuses and met

students from other schools. Shirley, having been from DC, had some other schoolmates from her high school who were in the area. I remember Veta from BU coming over from time to time, and then being able to meet people through that mechanism. We were sort of living in isolation, and the few black fellows who were around were more interested in Caucasian women.

That was sort of like a negative aspect of my experience. You know, "What about me? I'm here." I dated Caucasian guys too, but you have to deal with major cross-cultural, social kinds of chasms, you know? It's one thing to be good buddies and good friends, but when you're supposed to be dating it's a little bit more. There are hurdles. That wasn't too good. I was spoiled. What's the ratio of men to women? I mean, what was it in those days? About fifteen to one?

Well, that's true.

So I guess I had more dates with different people than I did with one person. I did socialize in African circles and that was interesting—the music and the dance and everything. I always liked music and dance. Again, there was a big cultural difference and of course most of them are very accomplished, bright folks, but there are a few cultural gaps to deal with there.

That's an excellent issue that I know is still very much alive. I don't know what black women would actually say about what's going on now, but it certainly is an issue because I've heard it enough. I think the ratio now is probably more close to being even.

Amongst the minority students?

Yes, still probably a slight edge toward the men. I must say, just from a distance, on campus I do see more couples, black couples. Again, I would not dare say what the case is because I don't see enough, and the key would be what black women would say.

I really feel that I am capable of having the cross-cultural relationship. That's not the problem. But as I mentioned, at that young, naive stage of my life, being very vulnerable, and having a lot of insecurities and lack of self-confidence, it didn't help in that area. I got over that kind of thing that because I was Negro or black that I should be inferior. I got over that, but then the whole coming through adolescence and into your social life and then being ready to move on to a real relationship—that did not happen.

That's a very important topic, I think, that I'm going to make sure I talk about more with all of you in the different periods of time. It's something that even if people don't talk about it, it's on their minds.

Right, exactly. We were around enough to see some people—other students, not necessarily black students—get into relationships and get into marriage. Some of them, before our eyes, broke up. Some of them married. Then other people who we were used to seeing as a couple we would find out that they broke up. That was kind of discouraging. I think that there was a lot lacking in terms of some medium through which the black students could have fellowship. Even if you're not interested in someone romantically, you could use it to get together and do things together and fraternize.

Would that be one of the things that you would actually encourage to happen on our campus? Describe what you would recommend more of.

Well, I will tell you something that I enjoyed thoroughly when I came up for Alumni Week a few years ago. I really thought that the program sponsored by the black student organization was the most happening thing on campus that day. They had some fantastic forum going on—about blacks in science through the ages, with some really outstanding panelists. Mae Jemison, the first African-American astronaut, and Ron McNair's wife, Cheryl, and some other people were there that day. It was absolutely fantastic.

Who sponsored that, do you recall?

The black student organization, BAMIT.

Oh, BAMIT sponsored it. That's a great young man, Darian Hendricks, who's doing excellent work.

Yes. I really thought that was good, and that it bridged the gap between the alumni and the current undergraduates who were around. Also, at that particular forum I met a group of high school students from a science high school that was just started. I said, "Well, where is your high school?" I ran into one of the students and he said, "It's in Newark, New Jersey." I said, "Oh, that high school, I read about you." I met the principal that day and my daughter was finishing eighth grade. She applied and went to that school the next year. Mom was her link to find out about this high school, science high school. It's called Chad Science Academy.

That was a nice bridge, that sort of event, and whatever things they have during the school year that they might do periodically, regularly, social and otherwise. I'm not sure what their regular academic year schedule is like, or the events.

I think they offer things all year, but in general the undergraduate students—particularly the National Society of Black Engineers—I've heard that they have one of the most provocative programs or student groups in the country. And the MIT group outshines them. I mean, they do an exceedingly good job. They have excellent programs, outstanding leadership, people are very serious about who is elected as president. They really, over the years, have been just fantastic. I think the BSU, the Black Students' Union, depending on the leadership, sort of goes up and down. But the National Society of Black Engineers is always very good.

I must say that it's a pleasure, particularly when one looks at the significance of your contribution at MIT. As one of the first black, African-American women to graduate from MIT, you will definitely be noted in history.

YVONNE L. GITTENS

BA 1979 Lesley College, MEd 1980 Harvard University; clerk-typist, receptionist, and secretary, Office of Personnel Relations, MIT, 1965-1969; secretary, Opportunity Development Office, 1969-1972; administrative assistant, Department of Urban Studies and Planning, 1972-1979; assistant director, Student Financial Aid Office, 1980-1986; associate director, 1986- ; also served as financial aid advisor and consultant, Project REACH, Freedom House, Roxbury, Mass., 1988-1996; active with Association of Black Admissions and Financial Aid Officers in the Ivy League and Sister Schools; recipient, MIT President's Award for Community Service, 1994.

My grandparents are from Barbados, so we always considered ourselves West Indian. It was always a proud thing to be West Indian, still is. My mother had three sisters and four brothers. I am closer to my mother's family than to my father's family. My father's family were originally from the South and they all lived in Cambridge, grew up in Cambridge, born and raised in Cambridge. All of my grandmother's children were born in Cambridge, literally within walking distance to MIT—I mean, in that Central Square area. That's where most of them still live and that's where I still live. My parents separated when I was about eight years old. A lot of extended family stuff went on. We lived with my grandparents. Everybody in the family lived there at one point or another. I have one brother who's a year younger than me.

My mother always worked in factories until she came to work at MIT. She used to work in the ice cream cone factory, and I always remember that because we always had ice cream cones and very seldom had ice cream to put in them. So we often just ate ice cream cones. When we did have ice cream and the truck came, we went into the house to get ice cream on our cones and didn't buy them from the ice cream truck. That was always interesting. After that, she worked a lot in I guess what they would consider the electronics industry. She worked making speakers. She worked with the original KLH and then, when the K left KLH, she went with him.

So that was basically it. I went to public school in Cambridge straight through high school. When I finished high school, I had no intentions

of going to college. I just wanted to get a job, anything other than a factory job. So basically, that's how I ended up at MIT. I needed a job. I walked into Personnel one day and filled out an application. I didn't get hired right away. I think it was about a month later that somebody called me.

Do you remember about what year that was?

Yes, 1965. Either May 17 or May 18, 1965, is when I started work at MIT. I graduated from high school in '64, and for a year I worked at Lechmere and I worked at a couple of other places I can't even remember now.

So you never actually thought about going to college.

Never. It's interesting, though, because I always wanted to be a teacher. But the thought of anyone having money for college wasn't there. So if I was going to go, I would have to work days and go

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with Yvonne L. Gittens in Cambridge, Massachusetts, 28 March 1996.

nights. Once I started working at MIT it was like, why do I need to go to college? I've got a great job. I could go to Filene's Basement, buy clothes, and have my own money.

When you first applied for a job here, did you apply for a specific job?

No, I didn't. It's really interesting because I never thought of MIT. MIT and Harvard were not places that black folks in Cambridge would consider working for, because the word was you could only clean toilets or sweep up in the labs. I didn't know anyone who worked at either place. I'm trying to think, at the time there was someone on the City Council—I cannot think of his name—who was not black, but he was trying to get people to apply to places like MIT and Harvard. I got his name from somebody and so that was the reference point I used. I didn't know him, but I used his name as, "Who told you to come to MIT?" His first name was Tom and I can't remember his last name.

So I had no idea. I really didn't have any skills. I mean, I could type and I could take shorthand, but the thought of being hired as a black secretary at MIT I just knew was not going to happen. I knew it was not going to happen because there was just a perception out there in the community that they only hired people of color to do menial jobs. I wasn't going to do that. So when I did get called back for an interview, I was very surprised. I could not figure out what it was they were going to have me do. But I also needed a job, so I went. It's really strange because the person who I gave my application to was not a receptionist. She was one of the personnel officers who happened to be sitting at the reception desk. At that time, Personnel was in the basement of Building 11—where Graphic Arts is now, where the Quick Copy Center is. By the time she called me back, they had moved to Main Street. But she didn't tell me that. She just said, "Come in for an interview."

So I came here, back to Mass Ave, and I came real early, only to find a sign on the door with a map showing you how to get to Main Street. Well, I was not going to cut through this campus. It was just so frightening to me that I walked all the way back up to Central Square and went down Main Street. The map was just a map of buildings showing you how to walk, and I'm like, "No, I'm not walking through these buildings. Someone is

going to arrest me." It was just the fear of being a black person on this campus. You didn't see many. In fact, then most of the black students were international students. There were a lot of African students. There were not a lot of black American students.

So needless to say, I got there on time. But the weirdest thing about that, and I'll never forget to this day, across the street from the personnel building—where Personnel is now—was the old Daggetts Chocolate, I think it was Daggetts Chocolate. Brigham's used to make chocolates there, too. Across the street was Car Fasteners, and when we were seniors in high school, all of the kids who were not going on to college had a career day. You would go to different businesses, you would see what the business did, and then, if you were interested, you would apply for jobs there. When we were seniors in high school, my group went to Car Fasteners and, as we came out, they were working on what is now the personnel building, the Ford building. I said to the teacher who was in charge, "I want to work in that building." He said, "You don't even know what's going to be in that building." And we laughed about it because I knew I didn't want to work at Car Fasteners. The whole environment there for what the women were doing, it seemed like they were just sitting desk-to-desk and they weren't interacting with each other. People were writing and doing bookkeeping and stuff, and I thought, "This is not for me." And that's the building I worked in. That's where Personnel was, and that's still where it is now.

So when I walked down Main Street and saw that building, I just busted out laughing. I didn't know I was going to get a job in that building. But I started thinking, "I told someone I was going to work in this building." Sure enough, here I was. The person who interviewed me was Dotty Blair. She was a personnel officer. She hired me to work in Personnel in what they called their "records section." My first supervisor was Pat Langley, and I believe I was the first person of color ever hired in Personnel. I'm not a hundred percent sure, but I believe that I was. It was interesting. There was a Chinese girl, a girl from Germany, myself, an older woman, Bernice, and then there was another woman who was originally from Russia but had been here a while. We did all of the personnel action forms for people

who were newly hired to the Institute. Once they were hired, we would make sure their information got to Payroll so they could get paid on time. If anyone wanted to check on whether or not someone was employed there, they would call us and we would verify employment.

I worked in the records section maybe a year, a year and a half, or two years, and they had an opening for receptionist. I had the nerve to apply for it, only to be told that they had never had a receptionist without a college degree. My answer to that was, "Well, why do you need a college degree to tell people that you don't have any jobs open?" All the receptionist really did was keep the pencils sharpened, straighten up the magazines, hand out the applications, answer the phone, schedule medical appointments, time the typing tests. We did type some letters, but there wasn't a big deal.

So I said that and I got the job. There was no reason why this person needed a college degree. Then Doty became my immediate supervisor. She was really a very nice person. She had one bad habit, and that was that she would always call me "Sunshine." One day I blew up. I said, "I have a name and it is not Sunshine. I consider that derogatory. You can call me Honey, you can call me Sweetie, but do not call me Sunshine. I don't like it." After that, we got along fine.

Being a receptionist was very interesting. I got to see institutional racism at its best. Maybe because I was young, I didn't realize the effect of what I was seeing. I was only eighteen or nineteen years old.

You were young.

I graduated from high school at seventeen, so I took a year kind of finding myself. I was eighteen or nineteen. That's when I learned how to drink gin and tonic too, before I was of age. It was at all the Personnel parties. Did we have some parties? Whoa! But, funny things used to happen when people of color would apply for jobs. All of a sudden, jobs weren't available. So if you really wanted to get somebody hired, you really had to know who to see in Personnel. At that time, in my eyes, there were about five personnel officers who were not prejudiced. If you had friends whom you wanted to get hired, you would try to fix it so they could get interviewed by those people. You knew there was a sense of fairness about them, at least that's what I perceived.

So you really had to sort of direct your contacts.

Yes, you had to really play games. The other thing is that you got to know the people who were looking for people. They used to send in the job requisitions and you got to know people by talking to them on the phone. So you would call them and say, "I have a friend, would you give them special consideration?" At one time, there were a fair number of people of color coming through the door and getting jobs. They did not last. Included in that group was my brother, who blew it. He could probably still be here. He got an opportunity to work with someone in Project MAC—I can't even remember what that stands for now, but it was the old computer stuff over in Tech Square. They trained him and he could have used that. But a lot of the guys were young and stupid. I don't know what it was. Maybe it was a different level of racism they just felt once they got into the departments, I don't know.

But yes, you did. You saw a lot of stuff go on there, what I would consider illegal immigrants being hired—people who didn't have the right credentials, but they all got hired, in dining service and Physical Plant mostly. I used to laugh. I had a really good relationship with managers of the dining halls. But they would hire people without coming through Personnel. They would call and they would say, "Fix it up, fix it up." But they really looked out for the immigrants who were coming over, friends of friends. They had a real tight network and that's how a lot of people got in—you know, dish washers, pot washers, cooks, etc. They were able to move up through the system, and that didn't happen a lot for blacks.

When I first started in E19-E18—Physical Plant—there might have been, including the janitor, four blacks in that whole building, or five maybe. There were two in Graphic Arts. There was a Graphic Arts quick copy center in E19. They worked in there. I was in Personnel. Then a young man came to Physical Plant to do accounting stuff. There was the janitor. There was maybe one other woman in the Office of Sponsored Research. I used to just see her. Then after I had been in Personnel for a while, I think a woman came to the Registrar's Office. I don't remember what year she came. And one person came to the Bursar's Office. But there were not many people of color in that building.

When did Ken Hewitt come, in comparison to you?

Ken was already in Graphic Arts when I came. He came to Personnel after I had left Personnel.

What about role models and mentors?

Dotty Blair, I would say, was a role model, only because I think she was fascinated with this little black girl who didn't have a college degree. It was kind of like *My Fair Lady*. Can I turn her into a silk purse? I think that's what her fascination was, the fact that she and my mother were the same age. I think she became a role model by default. I don't think she ever intended to be.

I see. Is that to say that there was nobody else?

No, there was nobody.

Where did you get your strength from?

Where did I get my strength? From my mother and my grandmother, just the determination that you have to look out for yourself and you have to open the door a little bit wider for somebody else. They used to run pictures of me in the *Boston Banner*, sitting at the reception desk, "Come see me for a job." I would say, "Don't say that, because I can't give anybody a job. You can come see me to fill out an application, but don't give the impression that I'm going to get anybody hired because it doesn't work that way. You guys know that." You would have people come in and not want to take an application from me because I was black.

Or look past you, I suspect?

Look past you, or wait. We had two receptionists, and one of the women I still exchange Christmas cards with in Canada. They hired a lot of student wives too, but there were two from Canada who were very nice. One of them was sitting at the other desk, knee-deep in people and on the phone, and I would say, "Can I help you?" It would be like I was speaking a foreign language. Then my next response was, "Well, just stand there and wait, because it don't make me no difference." Then Dotty would come out and say, "Why aren't you helping?" I said, "Because they don't want to be helped by me. You've got to sign my paycheck if I just sit here all day and do nothing."

Or I would say, "We'll take your application, but nothing is available right now," and they wouldn't take my word for it. So I would just go around the corner and hang out for a few minutes and come back and say, "I just showed this to so-

and-so and they'll be in touch." They would be happy and go away, and I hadn't talked to anybody. That kind of stuff.

There's kind of a timeframe in terms of your tenure. You were there in Personnel. Give us a rundown of your sequence of jobs.

I left the reception area to take a job in the benefits section of Personnel, and I worked with John Carley. John was probably a role model. In fact, when I got the first presidential award, he sent me a nice little note. He still lives out in Lincoln. At that time, the Benefits Office was kind of divided into two sections. They had people working with retirement and health insurance and stuff, and then John, Sandy, and I were working on tuition reimbursement. The blood drive, we had a lot to do with the blood drive. It was not a student-run thing. And the community service fund was all out of the Benefits Office. The Benefits Office was the office that began the whole issue of child care, child care for MIT employees. We bought child-care spaces at KLH. I worked with this woman named Sandy. We actually developed that whole thing. We did the orientation for new employees and I used to bake cookies at home for the new employee orientation. But John Carley, Sandy,—I can't think of Sandy's last name—myself, and there was one other person, worked out a plan with KLH where we bought spaces and MIT subsidized part of the day care. I can't think of all the people who came through and used them, but we were the forerunner of the Child Care Office.

I'm going to digress a little here because, after I left Personnel, by this time the Child Care Office was formed and was no longer a part of Personnel Benefits. At one point, when I was working in the urban studies department and had almost finished my bachelor's degree, they had an opening in that office. My bachelor's degree was in child care from Lesley. I applied for a job in the Child Care Office and was told by that personnel rep, who was in Personnel at the time, that I didn't have a degree and I didn't have a real commitment to the Institute. I had only been here since 1965 and this was now 1979. I had like one semester left to complete my degree. I had been working on it ten years at nights, and I didn't have a real commitment? I didn't even get an interview for the job. That was the message. I had worked with the formalization of child care at MIT. And I bet you

those records are nowhere and, if they are, my name's not on them, I'm sure, because I was only a secretary back then.

But we did site visits, we visited KLH, we visited a lot of child care sites in the area, and we settled on KLH as the site that we thought would serve the needs of the people who were looking for child care. But anyway, I stayed in Benefits for a while.

Let's stick with that a minute, though. You're saying that you were working on your degree in child care, and you lacked one semester, and you applied for this job at that time.

Right. The qualifications were a bachelor's degree. They did want someone with a bachelor's degree in child care, but I figured one semester shy after ten years of continually working on a degree and you could have asked for my transcript, you could have looked at the tuition benefits that I was getting from the Institute to see that I had been chipping away at this. And I was told that there was no real commitment to the Institute. I don't know. I had already done some fifteen years, right? I didn't have the right credentials. I never followed up to see who was hired. I was just real angry. And whether she knows it or not—and of course she wouldn't because I'd never tell her, I wouldn't give her credit for that—that pushed me to get my master's.

This was the personnel rep.

Yes. She works around here somewhere. It's real ironic because I did a financial aid workshop at Brookline High and she was there. This was last year or the year before, I can't even remember. And of course she came up to me afterwards, "Do you remember me?" "Yeah." "I'd love to come by your office and talk to you about these things." I should have told her to kiss ass, but I didn't, and she came by my office and talked to me about financial aid. People need to realize that people they're stepping on and disrespecting, you may need them some day. I could have been a real bitch. I could have said, "Forget you."

That was something, you said, that pushed you on to get your degree.

If you're not going to take me seriously with a bachelor's, then I must have a master's. There are other things, and we'll get to those.

I left there to go work for Jim Allison in what MIT called the Opportunity Development Office,

which is the forerunner to Affirmative Action, that's what I keep saying. One of the things we did in the Opportunity Development Office was the head count. We wrote MIT's affirmative action plan. I use that "we" loosely. That office was given the duty of writing the MIT affirmative action plan. The other thing that that office did was we worked a lot—and Jack Newcomb, I think, worked on this too—with the prison release program, helping prisoners get reoriented. And they would be hired.

Here?

Here at MIT.

That's admirable.

Joe Lynch worked on that. Another employee was having problems in his job, so they put him to work on that program too. They would go out and visit the prison sites and see what kind of skills the guys were learning. A few people came—not a whole lot, but a few people. I think the commitment died pretty much. Dr. Foster had space in there too. He ran the program the Institute just got rid of, MIT's Lowell Institute. It's now gone to Northeastern. Doc Foster had a secretary who worked in another building, but he had space in there. I did a little bit of typing for him. He was a real nice guy.

But I worked for Jim Allison. The other thing that happened out of Jim's office was that the Institute had a commitment to hire minority subcontractors. There are classrooms on the first floor in Building 8 with the moon-shaped windows. Those, and on the second floor too, were done by a black construction company. I can't remember all of them, but I remember that one specifically. The black contractors would use our office sort of as headquarters. If they needed to get phone calls during the day, they would come into that office and I would see that they got their messages and stuff like that. People who had complaints didn't really come to that office too much because there weren't enough people here to complain. If you felt you were being discriminated against, you just left. You didn't feel like you had anywhere you could go and complain. There were union grievances, but those were handled through Personnel and others.

About what year was that?

This was prior to my having Nicole. Nicole was born in '72, so this was from '68 or '69 to '72.

When I started working for Jim, I also started going to Northeastern nights. I had decided that being a secretary was like working in a factory. I was going to get a degree. I was going to be somebody. I didn't know what I was going to be, but I was going to be somebody. At the same time, there was a special black summer program here. I don't know if it was Interphase, I don't know what it was.

It was essentially Project Interphase, but they called it something else initially.

It had a different name. I affectionately would call Jim "the Paul Bunyan of the Institute," because when anything went wrong with the black students he would step in. The president would be on the phone calling Jim. When the students took over the Faculty Club, Jim to the rescue; when the students assaulted an administrator, Jim to the rescue; when they tried to barricade the President's Office or even had a sit-in out here, it was Jim to the rescue. They just used his bigness to come to the rescue all the time.

I worked with him and then I left on maternity leave. A friend of mine, who is not black, filled in while I was on maternity leave. She and I were really good friends. We used to hang out together. She and I had worked in Personnel together. She called me one day when I was about to come back and said, "Jim doesn't want you back here. He has trumped up all kinds of shit about you and told stuff to Personnel." I thanked her very kindly. I did shortly after that get a letter from him saying that my services were no longer needed by his office. I was angry. I thought this would be a good time to sabotage him by spilling my guts on everything I knew that had gone on in that office. But I got the letter on Friday and I had all weekend to think about it.

I said that I would never take anyone down. My grandmother used to have a saying that God will take care of you. You don't have to do a thing. I can remember when he left here, life goes on. It was interesting because I had another friend who worked in Personnel and she had called and said the same thing, that he had been maligning my character. I said, "That's okay, he'll get his in the end."

I ended up taking a leave and coming back. Well, Nicki was born in March and I didn't come back to MIT until September, so after I got his letter I just took a leave and spent time with my new baby. When I did come back, Personnel wanted to

know about things that had gone on in that office. I said, "I don't know, what are you talking about?" What had happened must have happened, I said, while I was on leave. The woman who replaced me spilled her guts on what she knew. I said, "Fine, let her do it." So I said, "I have no idea," and just left it at that.

So when I came back, I interviewed in the departments of physics and urban studies. I decided urban studies. I liked the field of urban studies. There were lots of people who looked like me out there—students, faculty, not any administrators, but support staff. The place was alive with color. It just felt like this was the place I wanted to be. It did not feel like MIT. That was a good experience.

So you went there as—?

As a secretary for the Department of Urban Studies and Planning, with the HUD program. That was a program with HUD, the Department of Housing and Urban Development, funding graduate students. People, my people—black, Mexican-American, Puerto Rican, Native American—were getting money to get a degree from MIT. They were getting their master's and their Ph.D's in urban studies and architecture.

Sounds like you enjoyed it.

I loved that. It was the best experience. I'm not saying I liked everybody. There were some students who had to be reminded every once in a while that this was not the land of milk and honey and that they were still black. There were some faculty up there who were extremely racist, and they're still there. There were some who were very sexist, and they're still there. But the students, I have made some of the most lasting relationships with those students. They were my age. They were having kids at the same time I was having my kids. The kids used to hang out together. We used to hang out together. There was the Community Fellows Program.

Who ran the Community Fellows Program?

They were over in E40, and it was Mel King and Frank Jones. We didn't see them a lot, but the students would go back and forth. But in the HUD program, the director was Bill Davis. Other professors had office space in there. One professor, who was not minority, got quite an education from having his office there. I basically typed for the director and the other two professors, and kept the stuff straight on the HUD program. Then after Bill

left, Phil Clay became the director of the HUD program. After Phil left, Frank Jones became director of the HUD program. At one point I was not only doing the HUD program, but I was also doing the Ph.D. program under Bob Fogelson. I can't remember. The heads of the programs changed a lot, so I can't remember.

I did like coming to work. I did enjoy that department. There were people up there who I wouldn't piss on if they were on fire. Some of the faculty, they were racist. They were, as I said, sexist. There were some secretaries I really felt sorry for because they didn't know how to handle people who made rude remarks and all the stuff you hear that goes on around here. There was a lot of sleeping around. That's the first time I really became aware of the fact. I was a little bit aware of it when I worked for Jim Allison, that the way you might want to promote your career around here is to sleep with somebody. That, I know, is still going on.

I had not heard that until one distinguished black faculty member told me this in my early years here. Do you think people understand that?

I don't think they do, I don't think they do. I think they think this is academia and that that wouldn't happen here, that it happens out in the sleazy corporate world where people are crawling all over, sleeping all over each other to get somewhere. It happens here. The sad part about it is, I don't think it's worth it. I really don't think it's worth it because I think the people who have climbed by that can never go anywhere else because they don't have the credentials. They got where they are because somebody stroked them or whatever.

When I was in urban studies, there was a lot of sleeping around between professors and students, and then when grade time came, people would be angry as hell. We secretaries would just laugh. The secretaries would just say, "Well, he graded you on what you were doing in bed, honey, not what you were doing in the books. You should have known better. You should have waited until after the grades were given out." But a lot of that happened, and people were devastated. There were students and support staff having affairs. Some of the students said, "It looks like a harem." They got carried away with it.

One thing happened when I was in urban studies, when I was working for the then director. Now, mind you, I'm married at this time with two

kids, going to school nights still, still hadn't quite gotten a bachelor's degree yet. The director was trying to promote me from support staff to that exempt category which no longer exists. He came up against a brick wall. The question that was asked of him was, basically, what else was I doing for him? He didn't understand what the question was. And he wasn't a naive person. So he called me and he said, "I'm having a hard time." At this time, it was a black woman in Personnel who asked him this question. And I thought, "What a bitch. Has anybody questioned who she's been sleeping with lately?" He said, "I don't know how to put this." And I said, "They think we're sleeping together, huh?" He said, "What?" I said, "It's everywhere. Don't they realize I have a husband?" And at that time there were no problems in my marriage. I'm not saying there were zero problems, everybody has problems, but there was no evidence that we were heading for a divorce. I had two kids. I said, "I go to school two nights a week and I work full-time." I didn't have time, nor did I need an extra-marital affair. I thought, "Can't people just believe that I'm good at what I do administratively?" He finally laughed it off and said, "Oh."

I did get the promotion and I did get the raise, but it bothered me to think that somebody would say that. And not only did they say it to him, they asked other people around the institution who knew me. "Well, how's her married life? How are things between them?" See, people knew my husband was running around before I knew he was running around. They always say the wife is the last to know, but it's hard to keep up when you're working full-time, raising two kids, going to school nights, and trying to be involved in the kids' activities. I was also on the board at the Cambridge Community Center, so I was involved in the community as well.

Was working in the HUD program the best of your experiences, when you think about MIT?

That was my best experience. If you ask me about a mentor, Frank Jones was my mentor. He did say to me at some point, "Look, you're not going to be the director of the HUD program. No, you cannot have my job. Go back to school." So I did. I applied to Harvard. I was scared as could be. You've got to remember, I had been working there since 1965. Except for two maternity leaves, I had not been anywhere. I had only been going to school

nights, so I didn't know what it was like to be a real, full-time student.

I started at Northeastern and transferred to Lesley. I cannot tell you anything about anybody in the classes with me at Lesley. All I know is that I graduated from Lesley in August of 1979 to start Harvard in September of 1979. Harvard admitted me in April without completing my degree. Of course, my acceptance was really contingent upon completing the degree. I think I had two weeks between the time I finished my degree and the time I started at Harvard. One other woman just happened to finish the same time I did. I can't even remember her name, but we were there, the first time Lesley had a summer commencement. It was at one of those big old churches up in Harvard Square. We didn't even wear caps and gowns. We had decided we weren't going to do that. She looked at me and I looked at her and said, "We were in classes together, huh?" And we both laughed. She said, "You know, this doesn't feel like a graduation because usually you're sitting with people whom you can reminisce with—remember this freshman year, remember this, remember that?" And I said, "I'm just so glad to be through."

The interesting thing about that was that when we graduated from Lesley, the person who handed us our diplomas was Catherine Stratton. And I have a picture. I've got to look for it now because that's in a Lesley publication—you know how they send you out those alumni things? In the next alumni thing that came out—it wasn't highlighted, but mentioning that first summer graduation—there was a picture of me accepting my degree from Catherine Stratton. Of all the people who graduated that night and all the pictures that were taken, why was that one picture in the book? She didn't know me and I didn't know her. I didn't know she was on the board at Lesley. Yet I have worked here, I began working here before they opened the student center which is named after her husband. It's strange the way things happen, strange the way things happen. I've got to look for that picture.

I remember that period. The thing that I always thought was so interesting is that you had some inner strength to continue on for your master's, given the family responsibilities and all the other stuff that was happening. We were trying to also get our friend to do some things. In fact, didn't Chuck Willie help?

Chuck was my advisor at Harvard. I guess if Chuck had had it his way, I would have gone on for my doctorate, and I'm sorry I didn't. It's not too late. I just don't feel like it now. The strength is now going in other directions. It's more into my kids and their goals. One of the people I interviewed with was Chuck, and I interviewed with Belinda Wilson. I guess I should have latched onto her star.

I'm the only one in my family with a master's degree on my mother's side or my father's side, the only one. I think a cousin on my father's side may have a master's degree, but I'm not sure. But there aren't a lot of us. I have cousins forever, cousins forever, and I think we can count on one hand the cousins with bachelor's degrees. I have four cousins with bachelor's degrees. Even when I look at the kids, the cousins, my oldest daughter's generation, she's the first of the grandchildren. And she's not the oldest. My cousins have kids older than her. They have not gone to college. She is the only one. On her father's side, she is the oldest grandchild. She is the third oldest cousin. If the Gittens cousins of her generation were to all get together, two of them have degrees, two are currently in college, and the rest are out in the world.

How did you do it?

Part stubbornness, part I'll show them, part just wanting something better for myself. That's a hard question to answer. I've always been, "Don't tell me I can't do it, because I will if I want to." If I don't want to, I don't care about it, I don't give a shit. But I've always been determined.

My grandmother said that I walked at nine months. There was something about me that made her feel I was going to go the furthest of the grandchildren. It's interesting, because I always feel her presence and my grandfather's presence. I feel like I'm never alone because they're always right with me, and my grandfather died when I was in high school. My grandmother just died in the '80s. So my kids were lucky. They had two great-grandmothers whom they got to know, really got to know. Kendra, my youngest, will tell you she doesn't remember them, but she was five or six when my grandmother died. She just has selective amnesia.

But in urban studies, there was definitely a sense of togetherness. If somebody needed something, there was somebody there for them. I have

no idea what it's like now. I don't even think they get the numbers of minority students. I just got a call from a former student who is living in St. Croix. In fact, he called me a while ago and we've been talking back and forth. The number of invitations, "Come visit when you're in town, see me." I could literally go out of town to any of these meetings I go to and not go to a meeting, for keeping up or catching up with all the alumni. Every time students come into town, they stop by to see me. People just jump in and see me. I get calls from undergraduates, "You don't remember me, but I've got a friend who's coming," or a sister or a brother or somebody, and I say, "I do remember you."

Before we go to that piece that I know is very much related to a number of people who you added on after you left urban studies—that is, the financial aid area—I want to stick with this point about you. I've watched it and I want to get your feeling about this, because you have a personality which has been consistent.

I know. I tell my minister that all the time. Every time we get a new minister, I say, "When you're ready to bury me, there's one thing you've got to say, that I was consistent."

Tell us a little bit about that consistency and how people have reacted to it.

I think it's gotten me in more trouble than not. Maybe it's because I don't like people who are phony. I don't know how to put it. I can think back to being in fourth grade and quitting school because the teacher was messing with me. My mother went to the school the next day and said, "Look, I work in a factory. I get paid by the hour. The hours I'm not there, I don't get paid. I'm not coming back up to this school again. Don't be messing with my daughter."

I see a lot of me in both of my girls, especially my youngest daughter. I think it's going to get her in trouble because people are not tolerant anymore of outspoken black women. The mood of the '60s and '70s is gone. It is time for us to be quiet and be good little negroes, and I cannot do that. I know there's a book entitled *The Good Negro*. I might have to go buy it and read it and see what it's all about.

A lot of people don't like my directness. It's interesting. When they were considering me for the position in financial aid, I had had several run-ins with one of the aid officers, when I was in

urban studies. She used to just mess with the students. She made them jump through hoops for money. I would say, "Black people need money. Students need money. Don't play games with them. If you're playing games, then you're not helping." So one of the questions they asked my former boss was, "Well, you know she's got a temper." He said, "If that was a white male, it would be considered arrogance and it would be good. If she has an issue with somebody, she's going to bring it out and usually she's right about it." If I'm wrong, I'll tell you I'm wrong. But if I'm right, it's like a dog with a bone: I'm not going to let go until I get my point across. And I think I've mellowed. (You don't think I've mellowed. Okay, I haven't mellowed—I went through a mellowing process.)

I do remember in urban studies when I had my own personnel rep, separate from the one everyone else had, because I threatened the other one. She was messing with me, okay? I was trying to work on a degree. There were two classes I needed. I'm in summer school. I was going to school around the clock. I did not have the luxury of taking the summers off. One of the classes met in the morning at eight o'clock, so I had cleared it with the Department of Urban Studies that I would take this eight o'clock class. It was an hour class. That meant I would probably get to work by nine-thirty, but I would stay an extra half-hour or I would give up a half-hour and have a half-hour lunch. She's going to tell me, "You can't do that." I said, "Excuse me? Tell you what, you come over here to Building 7 and tell me to my face I can't do that, and your ass is going over the railing. That's not a threat, that's a promise."

So they had to get another person to be my personnel rep. "Who can you get along with over there?" But the woman was messing with me. I had been at MIT all these years. I wasn't trying to stiff anyone. The course was required. The only time it was going to meet was in the morning. I was going to have to wait another whole summer to see even if it was offered and if it was going to be offered at the end of the day. The next summer, I'm taking courses that start at five and not getting home until nine-thirty. Did I ask anybody for anything special?

So that kind of stuff just bothered me. She said, "You're going to set a precedent." Did anyone else in urban studies get a degree while I was up there? Did anybody else even care? Did anyone

have to do my work? If the professors were coming and saying this was interfering, then I could understand. But it's the summer. How many students are around during the summer? A handful. It's not the academic year. That kind of stuff.

But I think I've mellowed. I don't threaten bodily harm anymore. I'd think about it, but I don't threaten it. It's just the injustices I see that bother me.

The kind of inconsistencies that have probably touched you and get to you more than anything else over a long period of time—having been here for a long time—could you talk a little bit about some that you have seen in the institution where we have spent pretty much our whole career?

Okay. How can someone who's working in Personnel be allowed to physically slap another employee and not be terminated, but be found another job somewhere until things cool down? That person is still working in the Institute now. I can't even begin to remember all of them because, after a while, you just throw them out. You don't even remember them, you just throw them out.

But there are just so many things you see. You know the games they play. "You don't like working for someone, so we'll go stick you over here for a few months. I think it's the basement of Hayden Library where they've got all that extra space. You just sit there until something comes up in the *Tech Talk* that you like and we'll try to get you in there." And all the while you are still getting paid.

Do you think qualifications play any role in employment of blacks here at the Institute?

Yes, the qualifications. You have to be much more qualified to get a job. I think some of the people of color who work in Personnel have been gatekeepers. I had it out with a couple of people. When I was trying to hire somebody, "Well, I don't think that person is qualified." I said, "Wait a minute. I want that person to work for me. If it doesn't work out, I'll get rid of him and we'll get somebody else. Let's give the person a chance, let's give the person a chance." I think they do that much more for white folks than they do for blacks.

Only two folks in the office have master's degrees, okay? It doesn't mean anything. I would be willing to bet you if you were to lay out the salaries, I'm not the highest paid next to the director. I should be. I've got a master's. I've been in the

Institute longer than anybody. I can tell you right now who the highest paid in that office is. Why? Because to buy him back, somebody cut a deal. So we have to make less than him? Because he's male? Because he left and came back? Because he thinks he knows more? And I'm not saying this to be vicious. I like him. He's one of the few people in the Student Financial Aid Office and the Institute that I like. I can be honest with him. We feel the same way about the things we see being done to minority students. Whenever you bring it up, "Well, can you keep statistics so we can prove it?" Simple, when you say this is a black student who wants an un-cosigned loan as opposed to saying this is a student who wants a cosigned loan.

You bring up the issue. That job there is something that maybe we could talk a little about, because that's the one that you have been in the longest.

Yes. Let's see, I started there in '80, so it will be sixteen years in August.

Sixteen years. That is a lot of time and experience in that area. How has that been? You've seen a lot of directors, a lot of things, and have dealt with many if not all the students of color who have come through this place.

It's been up and down, it's been interesting. A couple of us went to visit a sick colleague the other day. He's not doing well, health-wise. I respect him, but it's interesting because I'm not sure where he falls in terms of minority students. I think part of it was that he tried to father everybody, or grandfather everybody, but I know a couple of the run-ins that I had with him were around the issue of minority students, where I think I'm fair. I think if I see a student who obviously needs to be made to toe the line, I'm going to do it, where some folks won't do it because it may be interpreted as racism or whatever. There have been minority students he's handled who have gotten to the point where it was beyond repair, and then he would dump it in my lap and say, "Can you fix this?" Then you end up with it, even though you might not have been in on it in the beginning, and everyone is looking at you.

One of the hardest things for me was when I was a freshman advisor and I had one young lady in particular—very, very difficult. She should not have been here. She was too young. She was going through a lot in terms of medication for depression and stuff, and had gotten some bad advice from her dad once about not taking her medicine

anymore and all that. She had gone through Interphase. By October, Columbus Day weekend, I was on the phone calling her father saying, "Come and get her. Take her home. Get her out of here." There were three—at least two, maybe three—black women on the staff here who accused me of being a gatekeeper, and that I was no better than the rest of the people asking that young lady to leave. She eventually got her degree from here, but she did not need to be here that year. She had just turned seventeen. She was too young. She had a lot of problems she needed to iron out. She came back to visit me last year. She's now got a graduate degree and is now working.

She's in DC, you said?

Yes. But she put me through my paces when she was here. It was at the time I was going through my divorce. She was very, very needy, to the point that every day I had to say, "Did you bathe, did you eat, did you comb your hair, did you, did you, did you?" She went through being, "I think I'm lesbian—no, I think I'm not. I think I want to marry this African prince who already told me he has at least two other wives," who was a graduate student here whose neck I was ready to wring. Nobody came to me and said, "You're not trained as a counselor," but nobody else wanted to touch it. I later found out—I guess back then Interphase used to make the selection on who to have advise the minority students—that I was basically set up. It was said, "Yes, give this one to Yvonne because she's going to be a pain in the butt." Okay. What can I say?

You know, what bothers me in that office is that people will not admit to being racist. I think all of us have to admit there is a bit of racism in all of us, be it color-racism, religion-racism, age-racism, whatever it is. What I've become more and more aware of is how treacherous white women are toward one another. If they're going to be that treacherous toward one another, I know I don't stand a chance. What interests me is the way they're able to pull the wool over the director's eyes. I guess I'm very vocal. At one point I said to him, "Can't you see the bullshit?" "Well, you'll have to let me know when it's coming." "Hello?" It's amazing. Is it because they don't want to see it or they really just don't see it?

And that's what I ask myself a lot. I go through days when I say, "Lord, help me to act

more white." Then I say, "No, no, no, I'm only kidding." Be careful what you pray for. My grandmother used to always say, "You've got to learn how to bite your tongue," but it hurts. I had an aunt who used to say, "Your mouth has no cover." I'd be like, "Yeah, right, it doesn't." I can't think of too many things that I've said that I've regretted. Maybe the way I've said them could have been said differently, but the bottom line is they were the truth. That's what really hurts. People don't want to hear the truth. So how do you learn to get your point across without hurting anyone's feelings and still be truthful? Some days I do a better job of it than others, but it's a constant, constant, constant battle.

I'm constantly teaching Nicole and Kendra how to be strong black women, but not to the point where you can't advance in white America, because that's all there is for you.

Well, it's a tough one.

And Kendra is going to have a real hard time. Nicole's beginning to see it. I think working in Purchasing here at MIT opened her eyes.

Is Kendra more like you?

Yes. They both have me, but Kendra's mouth is mine. She'll take on anybody. I know pretty much my limits, but just recently she had a verbal tête-à-tête with a state trooper on the highway in New York or Connecticut. I can't remember where she was because I wasn't with her. It was a car full of kids, college students, and she said, "Mom, he went to cuff me and brushed my butt. You know it was all over. 'You touched my backside, you dirty old man! You pervert!'" "You want to go?" He let her go. And she'll tell you in a minute, "My father's a cop. I know my rights."

She's much like a kid learning to walk. They'll walk off the edge of the pool because they have no fear. I don't know what it's going to take, but I constantly talk to her about it. One of these days, someone is just going to say, "Pow! Now tell your dad."

Well, you know, I have more and more appreciation. People who are like that pay the price.

Oh, yes.

On the other hand, though, they help others.

Well, I won't have ulcers, that's for sure. I don't suffer from high blood pressure. So maybe health-wise, I'll end up okay.

The thing about it, which is hard and I think that's not said enough to people like you, is that you say what most of us think.

Well, that's what I say to people even in the office. I say, "You're all thinking it. You just don't have the balls to say it." So I'm constantly out there on my own. It's not unusual to come back from a staff meeting and somebody would say, "I'm so glad you said that because I was thinking it." And I say, "Well, speak up. All you have to say is, 'Gee, I feel the same way Yvonne does.' You don't have to say the words. I've already said them. If you don't have the balls to say it in the staff meeting, send the director a note, a little e-mail."

They won't do it.

They won't. Oh, I know they won't. I had a woman come to me the other day, because we had a reengineering thing, and I said, "This is what I heard." And someone else said, "Oh, you didn't hear that. I don't know where that's coming from." This is the director, now. He said, "Okay." We get back to the office and she said, "I heard the same thing you did." I said, "No you didn't, because you didn't have the heart to speak up." She walked out of my office and I don't care. I said, "Don't come to me and tell me you heard it. Tell him you heard it."

That's not new to you, I'm sure, because you've heard it all your life. But it's one of those things that I don't think is going to change any time soon.

It won't. It's too bad, though. This is 1996 and no one could have told me when I came here in 1965 that we would be as far back. We're back to where we were then.

That's a good point. Spend a minute or two talking about that. If you look at the '70s and all the way up to the '90s here, what has been your experience in terms of progress and where we stand now?

There has been very little progress. There may have been some progress on the student side, in terms of the number of students we're admitting. But when I look at the number of support staff and professional staff and faculty, we've gone backwards. We've gone backwards. People joke and say, "So goes California, so goes the rest of the world—or the rest of the country." I think the anti-affirmative action thing has already latched on, we just haven't talked about it. California had the balls to say out loud what the rest of the country has been doing.

Sometimes people really realize that you have to get beyond. One officer in the office would say, "Well, some of them are Jewish," and I'd say, "When I look at a group of white women, I don't say she's Greek, she's Italian, she's Jewish, she's Polish, she's Catholic. I see white women. When you look at a group of black women, you don't stop to think she may be Nigerian, she may be Trinidadian. All you see are black women and, even more than that, you see niggers. That's all you see. So you can't count yourself. Once in a while, I may look at someone and say, 'Gee, based on that nose, she could be Jewish.' But I can't really tell the difference sometimes between Greek and Italian. I really can't. I'm not just saying that, unless they were to start speaking in their native language."

We were talking the other day and a colleague was saying how when you see a guy with dreadlocks, even if he's got a suit on, he's going to get a bad rap because that hairstyle creates a fear. I said, "Yeah, but I feel the same way. I'm saying that when I see a guy with dreadlocks, it conjures up images for me as a black woman too. That's everybody's problem. But the same way, if you see a punk rocker with spiked hair, don't you get the same feelings I get?" He said, "Yes, you're right." Yes, I'm going to clutch my pocketbook just as hard. I'm going to clutch it harder going by the punk rocker than I am a rasta in a suit. Now you get a rasta in street clothes and a punk rocker in street clothes, I'm going to clutch the bag hard for both of them.

Based on all of your experiences here—and they're so extensive, I think it's a very important question to raise before we get to the end—what advice would you offer to other blacks who would be coming or applying to MIT as employees, a staff person, or even as support staff?

You know what I'd like to see us do—and we did this when we were in Jim Allison's office—is have a picnic. We did it out at the Blue Hills. I remember driving my own car, but I think we supplied school buses. There were hot dogs and hamburgers, and you could bring whatever you wanted. The funny thing about it was that we sent out an invitation to all black employees and we got a call from a couple of people. At that time, it was basically black employees. We didn't have a whole bunch of Hispanics and others, but this could be all-inclusive. Some people called and wanted to know how did we know they were black. One of

them happened to be married to a distant cousin of mine—not that distant, but anyway—and I said, “Oh, so you’re not so-and-so’s wife and you’re not black anymore? Well, wait till I tell his mother.” She went off on me and I was like, “Don’t worry, don’t come to our picnic then.”

I would love to see us have a day of unity. I know the Institute would frown on that. They would be very uncomfortable with that. But I’m not saying other groups couldn’t have their day of unity either. I would love to see us do a picnic, roller-skating party, Christmas party. I think the Christmas party used to be really great. I know OME tries to do a get-together of everyone in September, but it doesn’t feel right. I don’t know. I would love to see a day so that when new employees came, they got some sort of thing like what Nelson used to organize—a way for people to just, “If you feel like it, this is what’s happening,” get together.

I think the Kwanzaa celebration is geared towards students. There’s really nothing geared towards employees, and I think we need it. I think we need something exclusive from the students because the students are going to knit together around courses, around athletics. But we don’t really have anything that we can knit together around. I’d love to see something like that happen.

That is, for all the employees.

All employees, but mostly service and support staff came. That’s the way that picnic worked. I’m sure I didn’t meet half the people who were there that day, but we just kind of took over Houghton’s Pond.

Where did you have it?

Houghton’s Pond, up in the Blue Hills.

That was a good distance from here.

Yes. We provided school buses that left from either West Garage or Albany Garage or somewhere, and we provided directions. (Oh, be still my heart! I just thought of someone I used to have a crush on who worked here. We went to that picnic together. Oh, my God. I wonder where he is.) You’ll get people who don’t want to come, but you’ll get people who will come and will enjoy it and will say, “When are we going to do it again?”

Talbot House is too far. We used to do it in urban studies, go up to Talbot House. But that was more a student-oriented thing. We did a couple of

things out at Endicott House in Dedham, but it’s got to be away from MIT.

That’s very true. We need maybe to get back to that.

Like I said, the Institute will question the whole issue of why you are going to need a day to be on your own. And there will be some people who will say, “I wouldn’t come because I don’t want a day when it’s just all minorities.” But the invitation is out there, take it or leave it.

Hopefully, we can have some help in getting that done, possibly. Any other topic you’d like to mention before we stop?

Other than, where is MIT’s real commitment to affirmative action? When are they going to do something about it? When are they going to hire? And I’m not talking about that watered-down job description that Personnel keeps putting in *Tech Talk*. I don’t think the vice president for human resources, as that person stands now, is qualified to be the affirmative action officer. I don’t think she’s qualified to be the vice president for human resources, but that’s neither here nor there. She can have that job if that’s what she wants. We need a real affirmative action officer reporting directly to the president and not to the vice president for human resources, and let that person decide what kind of staff they need—if this Institute is serious about affirmative action. And then they’re going to have to kick butt with the faculty, because that’s where the biggest problem lies. That’s where the biggest problem lies.

LLOYD RODWIN

b. 1919, d. 1999, BSS 1939 City College of New York, MA 1945 University of Wisconsin, MPA 1946 (public administration) and PhD 1949 (economics) Harvard University; joined the MIT staff in 1946 as a research associate in city and regional planning; appointed to the faculty in 1947; professor of land economics, 1959–1973; Ford professor of international affairs, 1973–1987; emeritus, 1987; chair, faculty committee, Joint Center for Urban Studies, 1959–1969; founder and director, Special Program for Urban and Regional Studies of Developing Areas (SPURS), 1967–1988; head, Department of Urban Studies and Planning, 1969–1973; president, Regional Science Association, 1986–1987; Distinguished Planning Educator Award, Association of Collegiate Schools of Planning, 1998.

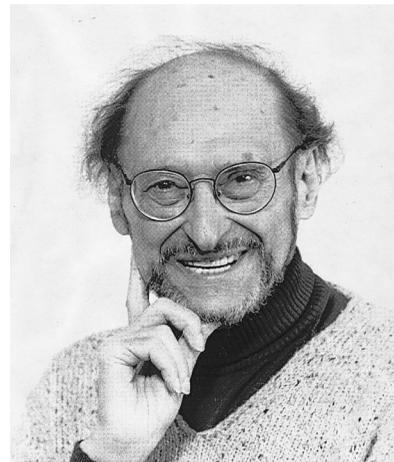

I grew up in New York City—in Brooklyn, to be more precise—and came from a working-class family. I had a father who was not well educated but an intelligent person, very strongly left-wing in his points of view. I was brought up in the belief that everybody was equal, and that one of the big sins in this world was to operate on a different kind of philosophy. That was a very important part of my upbringing.

I went to the College of the City New York. A free college, it left me with a permanent recognition of how important it was for people to get opportunities for education. One of the great problems of underprivileged groups is that they don't have a sense of how the world operates and how to manipulate the system. That was my situation when I was young. It was a great revelation to me to find out how people got things done, how people got ahead, why people are blocked, and so on. One of my cardinal beliefs is that everything that we can do to help young people generally—and underprivileged people in particular—to understand the world they live in, how it operates, how to negotiate the terrain, is critical for opening opportunities for them.

I originally was very interested in history and philosophy, and decided to go into teaching, since I was very “risk-averse” in that period (1935–1939). I planned to become a history teacher in the secondary school system. I cracked A's in practically all of the history courses I took, then had a terrible experience. To get into the school system one had to take an exam, given every two or three years. I took it and flunked. That was hard to

believe. So I checked on what went wrong and discovered that I was flunked on the grounds that I didn't know how to write English. At that time I was very much influenced by the writing of Laurence Sterne and his book *Tristram Shandy*. Sterne put a dash after every sentence instead of a period, and I put dashes at the end of my sentences instead of periods. Ergo, I flunked.

Now had I known how to negotiate the system, I could have raised holy hell—all the more so because the fellow who got the highest mark on the exam, I discovered, was a friend of mine, and I was convinced I did better than he did. I checked my score with his, and I was about twenty-five points higher. I had, in effect, the highest score in the city, but was flunked on this rather silly notion that if you don't put periods at the end of a sentence, you don't know how to write English.

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with Lloyd Rodwin in Cambridge, Massachusetts, 10 December 1996.

Anyhow, while I tried to figure out my next move I did chores during the summer in the garment district. Then I decided to take courses at the New School for Social Research. Since my resources were limited, I picked the cheapest subjects—one for ten dollars and the other for fifteen. One was a course in housing and the other a course in city and regional planning. I ended up with A's in both. One of the professors, Charlie Abrams, a famous housing expert, asked me to help him with a book that he was writing on the future of housing.

That experience changed my life. I ended up in Washington, for a period of time, in one of the defense housing agencies. Later, when I got out of the Army, I got a research assistantship at the University of Wisconsin, where my French girlfriend and future wife was a teaching assistant. I wrote two papers for two of my Wisconsin professors, which they liked sufficiently to arrange for their publication. One of the papers caught the attention of two prominent people in the field. One was Catherine Bauer, the other was Lewis Mumford. They thought it important enough to criticize at great length. For a while I feared I was in great trouble, but my professors said that on the contrary, I hit the jackpot. The controversy went on in the journal for some time and I ended up getting a fellowship at Harvard University, and eventually a Ph.D. I got to be close friends with both Lewis Mumford and Catherine Bauer. She was teaching at Harvard when I came, and her husband, Bill Wurster, a famous architect on the West Coast, was dean of the School of Architecture at MIT. Even before I did my thesis, I was invited to consider a possible appointment in the planning department at MIT.

At first we had no intention of staying here. My wife and I thought Madison, Wisconsin, was Shangri-La, and we intended to go to the Midwest, or even West. Boston not only had a climate that left much to be desired, but was in the economic doldrums. It was constantly compared to the South or Appalachia. But for lack of a better alternative, we thought we might as well exploit the opportunities here. It didn't take long to appreciate the intellectual richness, sparkle, and challenge of the MIT environment. We fell in love with the place, and when the opportunity came to go out West, we never considered it seriously.

I came to MIT about 1946 and became professor emeritus in '86. I've been on the faculty forty years and around here for fifty-plus. From time to time, I still give special seminars. I gave one a few years ago, a special seminar for the faculty, and edited a book with Don Schon entitled *Rethinking the Development Experience*. I've been asked to give another seminar next fall on "the profession of city planning." It will deal with the big issues in the field and the way they have changed over the past half century.

I have done still other things in the School. In 1959, I set up the Joint Center for Urban Studies at MIT and Harvard University, together with Harvard's Professor Martin Meyerson, and I was head of the Joint Center's Faculty Policy Committee for the next decade. We had a considerable impact in spurring research at MIT and Harvard in urban studies.

Then Jerry Wiesner and Lawrence Anderson asked me to consider becoming head of the department. I deemed this a great opportunity, if I could get backing to do some things that needed to be done. I wanted more resources put into the urban field. The former department heads Fred Adams and Jack Howard were good people, but far too gentle. They never pressed the decision makers hard enough to increase significantly the resources in the field or to do other things that were necessary. Of course, the administration tended to say, "We don't like to be pressed into doing things with a gun to our head." But the old adage is also true, that the wheel that squeaks gets the grease. Back then our wheel wasn't squeaking enough.

Unless I got backing to really correct some things, it didn't seem to me a position worth taking. I liked teaching, writing books, doing research, and a certain amount of consulting. But I had just finished a rather exciting period in which the Joint Center helped to plan and build and write books about one of the biggest "new" cities in the world. This was Ciudad Guayana, Venezuela. It now has close to a million people, maybe more. It was a major enterprise—a national, regional, and local development strategy, with vast economic, social, and political implications. I had been in charge of this activity for the Joint Center and I was all the more ambitious as to what I thought the department ought to be doing.

Jerry Wiesner asked me to write a memo spelling out what I thought was necessary. I did, on

January 27, 1970. Among the things I asked for was a doubling or tripling of the faculty. I wanted more research, and especially opportunities for minorities—for the black population, in particular—to a much greater extent than in the past. I also wanted to increase opportunities for women, and a vast increase of funds for students, for our library, and for computers, and so on. I was pretty aggressive, perhaps presumptuous.

But Jerry Wiesner said that was where the Institute should be going and I was only pointing out particular ways to make the right things happen. With regard to blacks and other minority students, I had something very specific in mind. I had developed earlier a program based on my experience in Latin America and third world countries. One of the things I had done in the past was to spend a lot of time as an advisor to various organizations not only in this country but abroad, particularly in third world countries.

Maybe I should mention an amusing story on how I got involved in these activities. Some students asked me in the early 1950s to teach a course dealing with urban problems in third world countries. I said, "It's a great idea, except that it's not at all possible." They said, "Why not?" I replied, "I don't know anything about it. I've never been to such countries, so it would be silly of me to do that." They left and then they came back, saying they'd checked around and nobody else was able to do it, and they pressed me to reconsider. I did and said, "I couldn't really teach a course, but I'll do something else. I'll run an informal seminar at my home and we'll study the subject together. I just don't see how I could in good conscience presume to give a formal course on a subject I know so little about." They accepted and we met regularly for a year every Wednesday evening. I learned a hell of a lot just by talking with them and reading a lot. Later on, these students went back to their different countries, became important in their fields, and kept inviting me to help them cope with their problems.

So inadvertently, I had developed a specialty. And this may help to explain my notion that we ought to have a seminar and opportunities for people from poorer countries to come to MIT at least for a year. They could take particular courses here, subjects that would serve their interests. Or they could take very few subjects but spend their time in the libraries—which we had and they

didn't—maybe on a project or working with an organization. The idea was to have a program tailored to the interests and needs of these people.

I asked myself, "What would I want if I were from one of these countries? Well, I'd like an opportunity to be free to do what I wanted to do, not to take a prescribed program." I thought most of our prescribed courses were not too relevant and our target should be people with rich experience. Why worry whether they had formal qualifications—particularly prerequisites, undergraduate or advanced degrees? The main thing was whether they were mature, had experience, and could profit from what we had to offer. Our job would be to identify the most capable people. If we got good people, they could go back and use that background in all sorts of ways. It would be a great opportunity for them, and a great opportunity also for their countries to get some of their first-rate people into a very special, privileged environment and tap it for all it's worth.

I devised a program for this purpose called SPURS, the Special Program for Urban and Regional Studies of Developing Countries. It still is in existence. I set it up before I became the head of the department. First, I got some money from Max Millikan, then director of the Center for International Studies. Then I got more money from David Bell at the Ford Foundation. I served on one of his advisory committees when he was the head of the Agency for International Development (AID). With these funds, we set the SPURS program up on an experimental basis for two or three years. Then we incorporated it into our program at the school. It was easy to do so because I was the head of the department.

The main point I want to make is that SPURS was the model for the Community Fellows Program. My thought was that the SPURS formula had broader applications. Very able people who are underprivileged ought somehow to be able to get into the Institute without prerequisites. Why not have them come here and take courses that would serve their purpose? We wouldn't necessarily develop special subjects for them, except maybe a seminar that they could all take advantage of and share their experiences. I had no doubts that we could serve people in diverse ways—people who had the potential for being leaders in their communities.

Many of these ideas were in the memo I wrote to Jerry Wiesner. And he agreed. Then it seemed critical to get the right person to guide the program. So I spoke to several important black leaders. I felt strongly that whatever else we do, we shouldn't turn our backs on our home community, Boston. I preferred someone from Boston, but I especially wanted someone who would not be regarded as an Uncle Tom. He or she had to be known as a fighter, a person highly respected by the black community.

One fellow stood out. That was Mel King. It was not easy to persuade him at first. He was very resistant to the idea. I remember my going down there with one of my black students and being rebuffed by him. Mel can be very sweet, but he can also be very tough and rough. Mel was scornful, skeptical, perhaps even rather hostile. I understand—or think I understand—why blacks, for all sorts of reasons, are and even should be skeptical and hostile to whites. Mel didn't know who I was or where I hoped the program might go. I paid no attention to his rebuffs, and it was a darn good thing I didn't, because he came and did a first-rate job.

When I proposed Mel King to the administration, they were very skeptical. Mel had a reputation then of being a very difficult character. They asked, "Are you familiar with this guy and his behavior?" Most of them felt I didn't know what I was getting into, and that the whole enterprise would blow up in my face. They warned me against it. But I thought it was a risk worth taking because if it worked, it would work very well indeed.

Let me tell another story by way of illustration. When Mel and I came to our first meeting with the Institute's administrative council, Mel was asked to spell out some of his ideas. This was before the appointment was formally approved. And he said, "The first question we have to resolve is the question of power." Well, you could see the faces of those present blanch. A few of them asked curtly, "Well, what do you mean by power?" I jumped in and said I didn't think that this would be a fruitful discussion, that we ought to come back when we could explain in detail how the proposed program would work. Jerry promptly agreed. We were invited to come back in two weeks—which we did, spelling out some of our ideas and avoiding an explosive confrontation.

This experience, of course, didn't make it easier to get approval. But we did. Jerry's role was critical. We couldn't have gotten it through without him, that's for sure. When eventually we had the appointment approved, Jerry turned to us and said, "Before we end this session, there's one thing which I want clear—we won't back away from this decision. I don't want anyone in the future to say, 'I told you so.' We all know there's a real risk, but we're going to back this to the hilt." And we all nodded.

Jerry had guts enough to say that, though.

Right. He was willing to take that responsibility. I must say that on almost every important issue laid out in my memorandum, he backed me. We increased the resources in the department by a factor of three—the financial resources and the faculty. I doubt if any department around the country had such an increase in so short a period of time. We got the money we wanted for the fellowships, for research, for the library, and for other programs.

During the first year, I met weekly or more often with Mel King and with Frank Jones, who was a Ford Professor. Frank came to our program from civil engineering. He was not too happy there. He wanted to be with us because the things he wanted I was ready to support. So Frank, Mel, and I spent the first year shaping the Community Fellows Program. Mel, of course, played the principal role. I was there primarily because Jerry felt, rightly I think, that Mel had no real knowledge of how universities worked or about MIT in particular, and that it was important for someone knowledgeable to work closely with him.

This almost created a bad relation with Mel during that period. Mel felt, rightly from his point of view, that this was a program for blacks and other minorities run by blacks, and that I shouldn't be there. Much as I agreed with him, Jerry wanted me there to be sure the program worked. My aim was to be as helpful as possible, no more. Most of the initiatives were taken by Mel and Frank. Every now and then I would suggest it would be hard to do this, or it's easier to do it another way or something of that sort. But I shared the view that it was Mel's program—and the quicker I got out, the better.

You were head of the department at that time.

Yes. Mel originally thought this program should not be linked to any particular department or

school, and I said, “Fine, if you can work it out. Where would you go? Who else wants you? Here you have a base where you’ll be appreciated. If at any point you identify another place in the Institute where you’d prefer to be, where you are wanted, I will never stand in your way. But for now you need a base and backing, and I at least can guarantee that you’ll get it here.” Mel never tried to go elsewhere.

The Community Fellows Program, I noted, was modeled on the SPURS program. That is still true, although the themes of the program have been changed and deepened. Mel is a charismatic personality and has raised money and attracted key Fellows of quality—vigorous leaders or potential leaders from Boston and around the country. I’m biased, of course, but in retrospect my impression is that what we did worked. It’s one of the things I’m kind of proud of, as former head of the department.

In terms of what has happened over the years relative to the presence of blacks and other minority folks here, could you outline what you have liked best and what you have least liked about MIT’s efforts in this arena?

As you know, MIT is a big and complex place. You say “MIT,” but you know there are a lot of different fiefdoms around here run by different groups. From time to time, there’s brilliance in one part and mediocrity in another, there may be very progressive attitudes in some areas and less progressive attitudes in others. My sense, in the period since I got closer to the administration, is that there is a heck of a lot of good will here, of wanting to do the right thing. Sometimes it came from the top. Sometimes it came from below, and the administration supported those initiatives.

Paul Gray was superb in this respect. Over the years, he handled these issues imaginatively at the Institute. A good deal also depends upon opportunities. That more blacks ought to be here, I am sure. But there’s a difference—in different fields—as to, say, the number of blacks who have the right background to qualify. The Institute, for understandable reasons, wants to attract top people in every field. People are right when they say it was in a number of ways easier for us to make these changes than for other parts of the Institute.

That’s not the whole story. A lot depends on how aggressively the people in charge search to provide opportunities. I can’t speak for other pro-

grams around here. My feeling—I could be wrong—is that much more can and should be done.

On November 24, 1970, you wrote a memo to Al Hill entitled “Minority Lecturers and Related Matters.” One of the things you wrote was, “We are also initiating a new program, described in the accompanying memorandum, intended to serve Community Fellows of minority background, mainly but not entirely blacks. The general intentions are spelled out in the accompanying memorandum. The program has just received start-up funds and will be initiated next fall.” And you cc’d Paul Gray. You said a lot of other things about what the department was trying to do, and you put it in writing.

I have no recollection of that memorandum. Maybe if I saw it, I would. But in any case, it sounds right.

The point I’m making is that what you’ve said to me very much reflects what you have in writing about things that you believed very strongly in. You didn’t just talk it, you actually went out and worked on it. What we see now, in the Community Fellows and SPURS programs and so forth in that department, happened only because some person believed that it was important to do it. That is what I think is very much missing in many of the other twenty-three departments.

I would qualify just a little bit what you’re saying, although I share your view. First, yes, I held these views strongly. These are basic values for me. But there were other people in the department, like Kevin Lynch, who shared these views. You’ve got to have not just a leader but other first-rate people around who lend support. As you know, some departments are benevolent despotisms and sometimes they are genuine group endeavors. Much depends on having at least a small core of people who feel these changes are important and push for them vigorously. It’s almost hopeless if you’re pushing from the bottom and many of your colleagues and/or your chief don’t share your views.

By the way, I just thought of something else you might want to know about. It has to do with the title that Mel got, adjunct professor. Mel felt and still feels—I think I’m reporting his views—that there was a certain amount of discrimination involved in his getting the title of adjunct. The explanation I gave never persuaded him. Either that or he didn’t want to be persuaded on this score, it’s hard to tell. But to bring up Mel King’s name for a professorship—given the criteria used,

articles produced and other credentials—would never have passed muster. I discovered this was a problem also in management and engineering. There were a lot of people with superb experience whom they wanted, who could contribute to their programs, and who could never get through the credentials screen.

So we invented or adopted the term “adjunct professor.” But we had a heck of a time getting it through the general faculty. There was terrific criticism. Many of my colleagues felt we were introducing a bad precedent. The term “scab” was used. It was said that people who didn’t have the qualifications would be slipping through a back door. People as eminent and as liberal as Professor Salvador Luria led the opposition, saying this was a dangerous and wrong thing to do. It almost looked as if we wouldn’t get it through. If you know anything about faculty meetings, they are dull affairs and when you get twenty or thirty people there, you’re doing very well. But these were meetings in Room 10-250, completely crowded, with people standing in the aisles. And we did get the damn motion passed.

If I understand you correctly on this, are you saying that as head of the department—and with other department heads—you helped to introduce the concept of adjunct professorship here?

Yes, but not without furious debates at the general faculty meetings. If I recall correctly, at least three departments pushed hard for it—management, civil engineering, and urban studies and planning. Each of the departments insisted they needed people with rich experience in the field and they had to have an appropriate title for them. We talked in terms of an extendable rolling appointment, say, for three or four or five years, with the possibility of extension beyond the initial period. That innovation enabled us to bring people here with valuable non-academic experience.

I bring that issue to your attention for a reason. You’re probably familiar with what has happened recently on the leadership succession for the Community Fellows Program. I tried to persuade Mel King he was making a mistake in fighting the department on this score. I did not succeed. I was on the search committee for a successor to Mel, even though I was an emeritus professor. Mel wanted me on that committee and so did Bish Sanyal, the department head. It was the depart-

ment’s view that the main candidate, recommended lukewarmly by the search committee, would never get through. Key people wouldn’t write a letter for him. They said if they wrote, the letter would not be favorable. And they were friends of the Community Fellows Program. There was a question, too, about the quality of the candidate’s publications. The department was willing, albeit reluctantly, to consider a non-tenured appointment, but they knew the candidate would not give up his existing tenured position. The department, too, was loathe to back something that would be shot down upstairs.

We had some evidence of that likelihood. The chair of the MIT faculty had attended the meeting where the candidate talked. He thought the candidate was competent, but clearly not one of the ablest guys around. By the same token, the question for the department was—if you want this program to succeed, it has to get a director who will be very highly respected. It has to get an equivalent of a Mel King, or the professional equivalent of the distinguished black scholars you have at the Harvard program. Anything less and the program will surely die or languish. If the Institute has to cut budgets, as they will from time to time, they’re going to cut the things they don’t consider first-rate. The only way CFP can maintain viability is to have a first-rate director, someone who would attract the highest quality Fellows.

Reasonable people may differ with the decision of the department, but that was an honest decision made to enhance, not to kill the program. Mel and the Community Fellows alumni, in my view, have made a serious misjudgment in saying that they’re going to fight the decision no matter what, saying this is another example of Institute racism. It is anything but. Mel wanted this candidate and the department wanted to take another year to find someone much better.

Maybe one good thing came out of the protest. Mel and the CFP alumni made enough of a fuss that we now have a top-level commitment to appoint a director for the Community Fellows Program who is also a distinguished black professional and/or scholar. We had that commitment in effect previously, and now it is explicit.

We wanted to keep this disagreement quiet, because we didn’t want to say in public what was wrong with the candidate. That would be a disservice to him. The department has plenty of nega-

tive evidence. The fact is, he was turned down previously by the political science department here at MIT, not able to stay on at Harvard, and not considered outstanding for substantial reasons by senior faculty members who strongly backed the Community Fellows Program.

Can you reflect on the nature of your relationship with black professionals in the field? You've had a lot of connections, but can you talk a little bit about your experience in that arena? If you were advising a young black scholar coming into the field today, what would you advise him or her to consider as very important issues that he or she should really make sure to deal with?

You're talking about MIT or elsewhere?

Primarily here at the Institute, yes, and particularly in that department.

It's the sort of question that one really ought to ponder. I can and will give you an off-the-cuff answer, but one ought to think about it a little bit more. Maybe we might have another meeting sometime.

First, we live in a racist society. All of us, including blacks and other minorities, are racist in different ways. Yet I think MIT is one of the less racist environments I'm familiar with. We've built up our department with concern for minorities and underprivileged people. That's a very high priority in our values and goals. Most of the professors here, I believe, think of themselves in part as advocates for this group—that this is one of their key roles. It is a very important tradition developed in the last generation. I hope it can be maintained for a long period of time.

But it's very hard, it seems to me, for a person who is a member of an underprivileged minority to forget the way they've been treated over time. A friend of mine, Ely Goldston—now deceased—and I once discussed that. Head of a major Boston corporation, Ely was an extraordinarily dedicated person and head of the Community Fund for a period. Mel King once dropped garbage on the head table the evening Ely and the Community Fund were celebrating the successful end of a year-long fund raising campaign. Thinking of this, Ely said, somewhat bitterly, "Even a dog knows how to distinguish between a kick and a stumble." But his son shook his head. "That's true, Dad," he said, "but when that dog has been kicked a hell of a long period of time, you can understand why even

a dog may misjudge the situation." There was a brief silence, then Ely said, "I take it back."

It's important—especially in this society, such as it is—to recognize where you have friends, in contrast to others you have to be very careful about. My view is—I may be kidding myself—that there's a genuine concern for minorities of all kinds in the little subculture we've built up in our department. And I think many key parts of MIT share these values. And we can augment and spread them.

But there's a greater danger than I suspected: that things done with decent intentions can be misinterpreted, not always for good reasons. I'm distressed that the decision regarding the Community Fellows Program has been attributed to racism. People have different views that need to be argued, but to call the department's decision racism is not just wrong, but unwise—it misjudges the environment, strikes below the belt, and alienates genuine friends. I am Jewish. I know what it means to be subject to discrimination, and to react to it from your guts. But it's important that the coalition that blacks and other groups have built up over time should be reinforced and nourished. One of the things that's worrisome, that I would remind your young black scholar, is that this coalition could break up, and none of us would benefit from that.

LINDA C. SHARPE

SB 1969 (political science) MIT, later a doctoral candidate in political science; research analyst, Boston Model Cities Administration, 1969-1970, and Raytheon, 1974-1975; research associate, Joint Center for Urban Studies of MIT and Harvard University, 1975-1977; program consultant in planning and proposal writing, 1978-1979; senior researcher, Center for Community Economic Development, 1979-1980; instructor in urban politics, Northeastern University, 1980-1981; from senior analyst to transportation analysis group manager, Unisys Corp., 1985-1997; section manager and task leader, Cambridge Systematics Inc., 1997- ; recipient, achievement awards, Volpe National Transportation Systems Center, 1987 and 1996; member, MIT Corporation, 2000- .

I was born in Brooklyn, New York. My parents were immigrants to this country, from West Indian backgrounds. My mother was from Panama and my father was from St. Vincent, British West Indies. My mother was a housewife and my father worked in the New York City subways as a conductor. The conductor is the person who opens and closes the doors and is in charge of the over-all safety of the train. My father owned a home in Bedford-Stuyvesant even before he met my mother. We stayed in Bedford-Stuyvesant, although many of our neighbors ended up leaving for Queens and Long Island.

I was educated in the New York City public schools. When it came time for me to go to school, my parents considered many different options. They did not want me to go to the neighborhood school in Bed-Stuy. They considered parochial and other private schools, but settled on a public school that was two districts away, in a neighborhood that was changing ethnically but had not changed totally at the time that I went to school. In elementary school, I received your basic public school education. I think it was a good school. We had good teachers, but the classes were large. There was a certain amount of ethnic rivalry between blacks and the exiting whites, but the students in my classroom remained largely the same from kindergarten through sixth grade.

When I was in the sixth grade, I had the opportunity to take an entrance examination for Hunter College High School. You had to be invited to take the exam; it was a major success to

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with Linda C. Sharpe in Cambridge, Massachusetts, 9 March 1999.

be invited to take it. I certainly knew very little about the school beforehand. It turns out that four girls from our elementary school took the exam. Hunter was an all-girls school, with grades seven through twelve. Four girls from our school took the exam—two black, two white—and two of us made it, myself and a white student.

My black classmate who took the exam and didn't make it had a cousin who went to the school and had access to the school newspaper. All the exam takers attended a little party at the home of the other girl who had made it. I remember I was invited to lie on the chaise in her living room. Then the girls showed me an article from the school newspaper, reporting the top scores on the exam. I had the third highest score. Fifteen-hundred girls took the exam and three hundred were admitted to the school.

That's quite an achievement.

I feel very confident in examinations. There were about 180 girls in my class, of whom ethnically about five or six were black, maybe two or three were Japanese-Americans and two Chinese-Americans. There were no Hispanic-Americans that I recall in our class at that time. It was a challenging environment, but I did pretty well. Throughout high school, I was a class officer. I performed well enough that everyone thought I graduated in the top ten. In fact, I didn't.

I concentrated on math and science. I really enjoyed the sciences. However, because it was an all-girls school, the prime departments were English, social studies, arts, and drama. I was involved in lots of socially conscious activities. This being New York City, there were many liberal, leftist intellectual types among the parents in our school. I was involved on the periphery of fundraising for SNCC and other liberal causes in the early '60s. Even before college, when the American public became more familiar with the civil rights struggle and with the anti-Vietnam and ban-the-bomb movements, I was tagging along to some fund-raisers and attending demonstrations. I can't say I was heavily involved. I didn't go to Selma. I asked, but my parents said no.

When it was time for me to apply for college, I knew I was interested in math, science, and engineering, but I still had my other interests in social and political movements. My high school counselors all wanted me to go to their alma maters: Smith, Wellesley, or Radcliffe—one of "the seven sisters," as they were known back then. But the summer after my junior year in high school, I attended an advanced placement physics course at Cornell University and became enamored of Cornell. It had a beautiful campus. I met some wonderful people and really enjoyed being there.

I was really determined to go to Cornell. Originally I had wanted to apply to Cornell's engineering school, but while I was there I interviewed with an admissions officer at the engineering school who told me, for reasons I'm sure you can imagine, that I would not be happy there. They had nine hundred students and only two women. I doubt they had any African-American students. He was very negative about my going there, so my feeling was, "Well, I won't go there, then." But I did apply to Cornell in arts and sciences as my first choice.

In order to mollify my guidance counselors, I applied to MIT because I did not want to apply to any of the "seven sisters," or to Swarthmore or any of the more artsy, liberal arts schools. Hunter, being an all-girls school, had very few students go on to MIT. So that choice really made people stand up and take notice. There were actually a couple of other girls who applied and attended. I'm still in regular touch with one. She works in Kendall Square for Lotus and her husband is a professor at MIT.

So I did apply to MIT. I scared myself by doing that. I took the AP math exam and my SAT's in my junior year of high school, and I was sure then that I would apply to MIT. I remember being very nervous during the SAT's. When I got my scores back, my math SAT was much lower than I expected. I had a very long session in the guidance counselor's office because I was hysterical about the score. The teachers were trying to console me by saying, "Well, it's a very good score—it's in the eightieth percentile and it's really nothing to be ashamed of." But I retook the exam and improved my score by one hundred points. It was just pure nervousness the first time. That's the kind of effect MIT has on an aspiring student!

I also remember an old friend of my father's saying that my father just couldn't believe I had decided to attend MIT. He would tell friends, "My daughter thinks she's going to MIT." He was delighted and a bit scared at the same time. When I actually got in, I still really wanted to go to Cornell. Of all the schools to which I applied, MIT delivered the least financial aid. The other schools offered full scholarships. My parents wouldn't have had to contribute anything at the other schools, but MIT was asking for a substantial contribution. My dad said, "Well, I'm going to be paying the bills and you're going. You're not going to get into MIT and not go." That was in 1965.

Parenthetically, there is something that's really changed about this society. In 1965, the Ford Foundation awarded National Achievement Scholarships for worthy black students. I was one of the first group to win the scholarship. The New York winners were reported in all of the New York daily newspapers—the *Daily News*, the *Times*, and the *Post*. When I look back through the clippings, they published your full name, full address, and your picture in the newspaper. That is just too dangerous to do in 1999. Many people don't list their

phone numbers anymore, and major metropolitan papers do not publish addresses of scholarship winners. The level of perceived threat is so much higher.

I won a scholarship, but my parents still had to make a substantial contribution to my education. MIT was a whole new school to me. I had not visited before I applied, so I came as a freshman never having seen the campus. One of the reasons I was excited about applying was because the political science department had been newly formed—in 1964, I believe—and had a well-known faculty. I came to the Institute with the intention of perhaps doing a double major, or at least knowing I was going to take political science classes.

Did you know at that time that regardless of what discipline you decided to go into at MIT, you had to take the same basic science and math core courses that every student had to take before going into a major?

The problem was that MIT did not place me out of freshman science and mathematics. At the other schools to which I applied, I would have gone in as a sophomore. I would have placed out of all of their freshman requirements and some of their sophomore requirements in science and math, based on my AP exam results. MIT was the only school that didn't allow that. They gave me only one semester in math.

That says a lot in terms of how advanced you were.

I was very well prepared. That was a problem when I got here, because I was too cocky about it. I should have taken some more basic math courses to improve my skills outside of calculus, which I knew well.

Talk a little bit about your first impressions of MIT. You mentioned that you had not come up here until you actually came as a freshman.

Having gone to Cornell the previous summer, I knew about thirty kids from that program who were also in my freshman class at MIT. So I already knew many people by sight. I didn't know them well, but I knew their names and their faces. That helped the transition. In addition, this was the late '60s and there were many new and radical changes in attitudes, music, and dress. There was a huge transition going on in Boston that had already started in New York; I had run into dress code problems, for example, in high school. My parents

were always very supportive about going down to the high school if I got into some trouble from time to time—nothing major, but trouble nonetheless.

You did speak your mind, right?

Yes, I stood up to authority occasionally. So when I got to MIT, I remember being really worried about who my roommates were going to be. I'd have two roommates and I was worried about compatibility. But that worked out well. I became very good friends with one of them. There was just a lot of exploration of the campus. Students were always excitedly talking about the latest album that had just come out—Bob Dylan or The Temptations.

And I was meeting other black students on campus. Frankly, I didn't expect to see many because of my experience in an elite high school and other selective programs. As I recall, in my freshman class there were three African-Americans and maybe one or two other people of African descent from the West Indies and South America, and a couple of people from Africa. I have to say I wasn't surprised, but on the other hand I don't think I expected there to be quite so few. So after the upperclassmen returned to campus, I started finding where the other black students were and who they were. I was just trying to figure out what courses to take, what Boston was about, where Harvard Square was, and where I should get my hair done.

You've had a chance now to reflect a great deal about your undergraduate education. Identify what you would consider of special significance in your academic and collegiate relationships. When you look back on that experience on the undergraduate level, what would you consider very special or significant?

I think it was the opportunity to meet students who were serious about a wide range of subjects, some of which may not have seemed serious at first glance but which engaged students deeply. People were involved with a whole range of activities, the gamut from tiddly-winks to social change and social revolution. Beyond that, there was the opportunity on campus to really come into contact with a wide range of very influential people and a wide range of artists and performers. "Cannonball" Adderley was part of the Stratton Student Center opening ceremonies. Some of these artists were very avant garde, like the Living

Theater and Charles Lloyd. Ravi Shankar was also a performer I remember seeing then. There were many cutting-edge artists who actually spent time on campus.

Then there was the opportunity to work with extraordinary people like Shirley Jackson, Fred Johnson, and Charlie Kidwell. The intense discussions and strategy sessions we had were an important part of my education.

What would you say was best about your experience, and what would you say was worst?

The best thing about the experience was the people and the lifelong relationships I formed. I think there is an MIT way of thinking. I feel comfortable working with people from MIT.

The worst thing was that it was hard to connect with some of the professors. It wasn't as if anyone was hostile; I can say that the faculty was very encouraging to me, they mentored me and fostered my career. But there was still a distance that existed between me and many of my professors that was difficult to bridge.

At the time you were here on the undergraduate level, do you recall whether there were any black professors here? Willard Johnson was here.

Willard was here. Was there anybody else that you recall, while you were on campus?

Jim Williams was in graduate school and about to become a professor. I don't remember whether he actually joined the faculty when I was still an undergraduate, but it was right in that time-frame.

But Willard was the only faculty member that you're fairly sure of. There was a fellow by the name of Hayward Henry.

He was after my undergraduate years at MIT; he was more involved with black students when I was in graduate school. He was at the center of a group of students. I was not part of that circle. I was an undergraduate before that time and a graduate student during that time, but I was not part of that circle.

You're talking about 1965 to 1969. How would you classify the quality and availability of services for you as a student?

I don't think MIT has changed all that much. I think there are services available if you take advantage of them, but many students choose not to. There were some people from whom I sought

help from time to time. I did run into some roadblocks. I was interested in many disparate activities and there was a lot of schoolwork that didn't get done when it should have. I had to really pull things together as a senior in order to graduate. I was able to mobilize some resources that did, in fact, help me. The wife of one of the faculty residents of the dorm system helped do this for students. I'd schedule time to go to the faculty resident's apartment, his wife would feed me tea, cookies, and encouragement, and I'd write my papers. It was kind of designated time where I had a mom substitute. I could get some work done and complete the work on a schedule.

Although I did find support as an undergraduate, I was a little too arrogant and headstrong. I did not take advantage of the resources that were available. They were available, though difficult to find on campus.

It sounds like you were very active on campus, is that fair to say? You got into a lot of things, and it wasn't just book work for you.

Right, absolutely.

It wasn't that way in high school.

It's still not that way. I like to be engaged in a wide variety of activities.

That has a lot to do with being tired of it and wanting to go on to something else, maybe that's what it is. But talk a little bit about some of the things you really got involved in as a student.

When I came to MIT, I tried to continue with some of the traditional student government activities that I had been involved in during high school. But I ran up against a group of people who weren't interested in working with me. I wasn't very interested in working with them either, so that ended quickly. I was a freshman class officer. I was also involved in Dramashop, and actually spent quite a bit of time doing that. I love being on stage, the smell of the greasepaint and all that. The theater was an interest that I carried through from high school. I was involved with some community activities, particularly when I was a sophomore. At that time I decided that even though there were lots of good things happening on campus, I really needed to get out into the community.

As a freshman, I took a freshman seminar. At that time, colleges would get together and have intercollegiate conferences on various topics.

MIT hosted a conference called “The Urban Challenge,” on urban affairs. Students in the seminar staffed the conference. From this activity, I gained a lifelong career interest in urban studies. While doing work for that class, I got to interview various key community leaders in Boston—Ruth Batson, Chuck Turner, and Mel King. That was before Mel came to campus, actually. My coursework was a vehicle for me to learn more about what was going on in the community. At that time, there was a lot happening—for example, the formation of the Metco program to offer suburban school slots to black inner-city students.

In my sophomore year, I decided to apply to Delta Sigma Theta so that I could meet black students from other Boston-area campuses. I was following in the footsteps of Shirley Jackson. When I came to MIT, a friend of our family’s had told me, “You’ve got to pledge Delta.” My reply was, “Sorority? Not a chance!” The Deltas had been inviting me to things when I was a freshman, and I didn’t want to have any part of it. But when Shirley pledged, and she told me a little bit about what they were doing and who everybody was, then I thought, “Okay, I can do this.” It was a great way to meet other black students and see what was going on at other campuses, to get involved in some community activities, and to gain lifelong friends.

Then, of course, in 1968 there was so much upheaval in the nation and in the world. There were protests on the MIT campus. There was a sanctuary for an AWOL soldier in which I participated. In fact, I recruited my friends from other out-of-town colleges to come and join us. I was upset that more black students weren’t involved with anti-war activities at that time. After Dr. King was assassinated, there was a series of meetings held on campus and I was involved in helping to bridge the gap between white students and black students. Then we started the activities that led to the beginning of the Black Students Union.

You were clearly one of the leaders who helped to build some of the activities that we still have on campus, including the BSU. As an undergraduate, you were not a person who stands by. You were out there in the thick of things.

Yes, in my own way. I don’t know that I was out front, but I was always there. I was always a body that could be counted on to get some work done.

I was there and trying to encourage other people to get involved.

Well, that shows. You didn’t mention what you majored in and how you actually got into that particular area, what you focused on academically on the undergraduate level. Share a little bit about that, and about what you decided to do after you graduated.

I majored in political science. I decided finally to major in it because it had the least requirements of any course of study, besides an unspecified degree. I was able to take courses in electrical engineering, economics, urban studies, mathematics, and civil engineering, a wide range of courses. I constructed a course of study that revolved around using computers to model complex social systems. I call it “a liberal technical education.”

How does that relate to what you’re doing now?

After I graduated, I worked for a year in Roxbury on a study of the public welfare system. Then I came back to graduate school at MIT and continued what I had studied as an undergraduate. I did not finish my Ph.D. That’s an issue, I guess, but with a small “i.” Over time, I have worked in social policy research. I am currently straddling research analysis and the computer system development in support of research. I currently develop computer systems that are used by transportation-related agencies to formulate and evaluate regulatory policy for transportation safety.

You’ve stayed connected with the Institute in several ways over the years—particularly, I guess, through BAMIT. Talk a little bit about some of your work in that. There aren’t a lot of you who have been as consistent as you have been in terms of being connected with the Institute. By the late ’70s, there was a critical mass of black graduates. People who were recent or relatively recent grads at that time, namely Kenny Armstead and Lorna Giles, spent a tremendous amount of effort to form BAMIT. Having been involved with the groups that founded BSU and the BGSA, I was there with BAMIT, too. BAMIT was an avenue for black graduates to build an ongoing relationship with an institution that had been bruising to most. It was very important for us to start the McNair scholarship fund and to have a vehicle for black graduates to stay connected. In the beginning, there was a very strong need for BAMIT to be independent of the Alumni Association in many real and symbolic ways. Now I think that’s changed.

When you were a graduate student, had it not been for you, I wouldn't be here. You had a tremendous amount to do with selecting me to be the first black dean in the Graduate School office. You were part of that powerful group of students who kind of told the institution what we needed. Could you talk just a little bit about that era, in terms of some of the things that that group of you were involved in?

Black graduate students recognized the value of having a black assistant or associate dean in the Graduate School office to address the barriers for black graduate students Institute-wide. Because all the departments act independently, there needed to be leadership from the dean's office in order to have a chance of increasing the number of black students at the institution, and of retaining them. So without a voice in the dean's office, someone who works there and who has power, there wouldn't be a way for that to happen. I think the Institute agreed.

You helped them to agree, right?

They agreed with that point of view. Then, when choosing candidates and coming down to the final cut, one of the issues was, "Well, if someone's going to be successful at MIT, they need a technical degree. They need a Ph.D., and at least a bachelor's degree in a technical field. Otherwise, there's no way they can be effective here."

Then how did I get that job?

We had a long discussion about why it was really important to consider a range of people and a range of degrees. Otherwise, there would not have been a pool of candidates to choose from. That was the next hurdle. Once we got a pool and evaluated candidates, the issues arose again. The students said, "We think Clarence is the person," but it took further discussion to convince the Institute that you should be hired without having a technical degree and, in fact, having a degree in a discipline that none of the MIT administrators recognized.

I think you made a very large impression on us in the interview. In fact, I have my notes. I looked at them recently. I think you just came across as someone who would have the fortitude to deal with the Institute. You were polished, quiet, and persistent, and would be able to make a difference—which you have.

I have never heard quite that version. It was done behind closed doors. I was really impressed with all of you. I had

never seen a group of students quite like all of you.

If you were giving advice to a young Linda getting ready to come to MIT, what kind of advice would you give her? What kind of advice would you give to a black student coming to MIT today? Even though we're talking about cross generations to a certain extent, your knowledge of this place since the '60s is very important. There are a tremendous number of resources here, and some of them are hard to find. Just ferret them all out. Take advantage of all the expertise, all the different disciplines, and all of the activities that are here. You're not likely again to find such a concentration of innovation, diverse interests, and frighteningly intense colleagues. At the same time, I think it's important to get off campus and contribute in the community. Boston has a wealth of cultures and resources. Meeting local residents in any context—church, volunteering, politics, civic and recreational activities—puts your stay here in a real-world context.

It goes without saying that you've got to work hard. Don't be put off by the competitive nature of the place or the fact that someone else is that much more well prepared than you are. No matter where you stand, there's always going to be that person who's more well prepared than you are. Even if you're the best prepared student when you get in here, you'll meet someone who is two years younger than you who is as well prepared. So the thing is just to get in there and not let the competition bother you. Just get in the arena with everyone else.

If I understand you correctly, are you saying that the chance of being at a place like MIT is once in a lifetime? It's the time of life when you're a university student and you have chances to do things that you wouldn't otherwise have. The thing about MIT is that there is a pressure to narrow your interests early in your academic career. I resisted that, and that's why I majored in political science—so that I didn't have to get narrow early. But if you're majoring in an engineering discipline, you're taking four engineering classes the last two years here in that discipline each semester. As you go through life and through your career, you're going to get even more narrow. You're going to focus in an area, you're going to get expertise in that area, and that's going to be your competitive advantage. You're not going to have as much opportunity to get breadth, or you'll have to work harder to get it.

At the Institute, the breadth is all around you—either the expertise of a student who lives next door to you, various lecturers who come through, performers, professors who are available, or extracurricular activities. But as you go through your career, it's not as possible to do that.

If you were to make any suggestions to the administration of ways you think the Institute could improve or enhance the experience of blacks at MIT, what kinds of things would you recommend?

We do have a cadre of black administrators and a lot of programs in place, but I think there needs to be a look at their effectiveness and how they can be improved over time, especially in relationship to the changing needs of black students. I think it's probably a mistake to regard black students, as few as we are, as being monolithic. Students come in as individuals and they're from somewhat different experiences and backgrounds. In an effort to help them all to success, I think it's important not to think that there's a one-size-fits-all approach.

I think numbers help. If the numbers can be increased, I think that can increase the success rate. That way people can see more different kinds of black people around on campus. I also think there needs to be more black faculty members. That's really a key deficiency at this time, in terms of helping more black students succeed. And I think there just needs to be a range of options open for black students in terms of living arrangements and academic help if needed.

Is there any other topic or issue that comes to mind as you reflect on your own experience and on the experience of other blacks at MIT?

I guess my experience at MIT was not typical. It was not typical of a black student, a black graduate student, and it was not typical of MIT graduates in general. But I think it was an experience that could only have happened at MIT. I think it was very good. To grow up with people like Shirley and Jennifer Rudd was great. I just wish MIT had admitted more of us so that there had been others in our cohort. I don't know if you're aware of this, but after Shirley and Jennifer were both admitted, for each of the succeeding three years, MIT admitted one black woman. I don't think it was, frankly, a coincidence that they admitted two that first year.

That was not an accident—just two, right?

Two, and only two. Then in each of the succeeding years, there was just one.

Of course, they were admitted in '64 and you came in in '65. Are you saying in '66 there was one?

Right, and she ended up not graduating. In '67, there was one.

There were so few of you, you had to be tough.

DANIEL T. LANGDALE

b. 1937, AB 1959 Ohio University; from lieutenant to captain, US Army, 1960-1964, serving with the US Army Signal Corps in Germany and at the Army Pictorial Center, New York City; staff, General Telephone Company, Fort Wayne, Indiana, 1965-1966; assistant to director of student aid, MIT, 1966-1968; director of student employment, 1968-1972; associate director of financial aid, 1972-1977, 1991-1996; associate director of admissions, 1977-1988; assistant dean, Graduate Education Office, 1996-1997; served as director of admissions, California Institute of Technology, 1988-1991, where he developed strategies to diversify the student body, including admission of more women and racial minorities; admissions and financial aid consultant, 1994-

I'm now assistant dean of the graduate education office, formerly associate director of both admissions and financial aid. And, as you know, I was the director of admissions at Caltech for three years.

How many years have you been at MIT?

I've been here for about twenty-eight years, I guess. I went out to Caltech in '88. Actually, I think I had a fairly significant impact on affirmative action out there, which I understand has been sustained. When I got out there in the fall of '88, they had no black kids in the freshman class, would you believe? And that was 1988.

They had none?

None, but it's a small school. We had, I think, about sixteen blacks in the class the next year, maybe twelve. There are only two hundred freshmen in all.

They bring in only two hundred freshmen at Caltech?

Yes. The approach we used was making calls and being nice to these young people when they contacted us. It was that simple. Honestly, that's fundamentally all I feel like I've done here in the last thirty years—just be a good administrator and a friendly human being. Then I've benefited from the friendship of you and John Mims and Ben Moultrie. I consider that I have the rough equivalent of a Ph.D. in interracial relations. I understood early on something about what it was like to be black in white America. I read *Black Rage*, I read the book called *Black in White America*.

I had never been taught about race. I was born and raised in Cincinnati by a father who had lived in the inner city and had friends who were

black and so forth. I never saw them as a youth, because by that time we had moved out to the suburbs. But at least I never had the experience of having any racist language or any kind of an attitude expressed by either of my parents.

I spent five years in the Army, where I worked with black people. While I was at Ohio University also, there were some black guys who were in my dorm. I began to realize that there were other people of color in the United States. It's not easy to learn that when you live in a white suburb. One of the attributes about the world, of course, is that twelve or fourteen percent of the population is a relatively small proportion of the people. And when they're isolated for all the social reasons that we know, people like me can get to be eighteen or nineteen without having really spent much time in the company of a black person. But when I got

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with Daniel T. Langdale in Cambridge, Massachusetts, 22 January 1997.

into the Army, I had black guys working for me and on relatively infrequent occasions, I'd be working for a black person. I was a lieutenant and captain in the Army, so it was only occasionally that anybody outranked me who was black, even in the '60s.

So after I got here to MIT, I think I've always been a good deal more comfortable. I haven't been one of those suburbanites in America who somehow were nervous around people of color, thinking that somehow the difference was really dramatic. Of course, John Mims and I picked up this fantastic friendship when he first hit the ground here. We hung out.

Now, you were working in the Admissions Office when he first came here?

I was in financial aid when Roland Greeley hired John Mims in the fall of '69. From that time on, John and his wife and Sharry and I just hung out constantly. We'd get pizza or something three or four nights a week. We really adopted each other. I think that a distinct part of the attraction was the fun of intercultural comparison. It was kind of fun to recognize what the similarities and the differences were in our youth. I'm always too much of a Pollyanna, I think, in this respect because I keep wanting to highlight the similarities. John and I would recognize that in his youth, whatever the cultural attitude was in this regard, his day-to-day experience wasn't really markedly different than mine.

And Sharry and his wife, who both came from sort of impecunious backgrounds, also had shared experiences. I remember one night at the Faculty Club, the two of them walked up to this table full of hors d'oeuvres and found these pickled pigs' feet. Of course, they had eaten those parts of the pig when they were little kids because that was basically what their parents could afford to buy. So the two of them were getting hysterical about the fact that here were these two women—one from Chicago and the other from South Dakota—recognizing this cultural similarity that was then contrary to the major culture, which thought that pigs' feet was some kind of a delicacy.

Anyway, we had a good time because we were thirty-something and enjoyed each other's company. But during the course of that time, I think that I benefited from John having illuminated me about what life was like if you had to

continue to face doors that might be slammed in your face because of your skin color.

So my enterprise here has always been to make sure that no black kid—and, of course, Mexican-American kids came along later, and the occasional Puerto Rican and Native American—was ever rebuffed. I never ever wanted a kid to either be in my office or to leave it scratching his head and wondering whether some behavior on my part had been a product of his or her skin color. So basically, all I've ever done in my own humble view is treat these kids at least as well as I ever treated a white kid. It's been my kind of rule of thumb. I've always treated white kids the way I wanted my own children to be treated. So I'm just a nice guy.

Of course, back in the early days at the Institute, people started to work on this environment—thanks to Paul Gray and Al Hill and Jerry Wiesner and others, with the instigation of people like Shirley Jackson and Fred Johnson and Michael Von Sawyer and Richard Prather. I remember these kids like it was yesterday. All this energy was there, and the Institute—through my boss, Jack Frailey—was endorsing the idea of people like me, a financial aid officer, being helpful. We had the resources, and we had the will and the way and every intention. As best we could during those revolutionary days, we continued to try to keep pitching hay, so to speak, to this energetic thing that was happening.

You mention your and John's relationship, which I think is very unique. It emerged out of this environment, really. This is not a fluke—I mean, this has been going on for years. I know that you are extremely close. Obviously, you have learned a lot from him and he has learned a lot from you. Talk a little bit about what you have learned about being black at MIT, or about being black in America, that you think is unique.

It's an interesting question and I have pondered this. Of course, I've come to a much better understanding of various facets of what racism implies during this thirty-year period, thanks to you and John and other people. It's one of the realities. Just to return to the enterprise, the Institute, of course, was appropriately and pointedly recruiting, hiring, and admitting some of the best people—black, white, and brown—that there were. And I was thinking, how is it that all these people—John Mims and John Mack and Ben Moultrie and Brad

Haley and Nelson Armstrong and Eddie Grado and Margo Tyler and Ike Colbert—became pretty much who I consider really close personal friends? And John is my best friend. He and I definitely bonded.

I think one of the reasons is because these are superior human beings. So in some ways, in part the answer to your question is that having the opportunity to associate, to benefit from the company of these excellent human beings, I began easily and quickly to understand that the burden that was formed as a product of three hundred years of bondage was a burden that I would never really understand and that I would always give the benefit of the doubt to. In other words, some kids seem to some as being sort of disabled. Some black kid comes in and, let's say, is using Ebonics, or some attribute in this regard that seems not to sort of align with the cultural norm in the United States. I'm perfectly comfortable about accepting the fact that he's different because he's a product of a very different, long-term cultural experience.

I can easily accept the fact that in 1997, the impact of slavery still pertains. I actually believe that a good deal of that impact is upbeat and positive. The black people I know have a certain humility—call it “soul,” to coin a term, right? There's some sort of an accommodating attitude about difference, about having to get along, and about dealing with the exigencies of life that just strikes me—and this is probably racist on my part—as being born out of a gene pool that has somehow survived three hundred years of terror, really.

I don't think the nation has remotely come close to acknowledging the reality of three hundred years of slavery. There's a great deal of cultural cover-up that's been going on in this country since the Civil War, with all the pictures of little children dancing in dust and old black men playing the violin and that sort of thing down by the slave cabins. I know that these people were working sixteen hours a day and being fed table scraps and being clothed in castoffs—and contemplating, from time to time, poisoning their owners. It was an ugly damn business, really, and I don't have to explain this to you.

So surviving that is an incredible accomplishment. I'm not suggesting that somehow genetically the current black population has been winnowed out, but I just think that there's a shared

awareness of having to somehow make your way in life that has yielded a behavioral pattern that is admirable. I'd see it in these kids who somehow persevered, sort of survived the MIT experience, which of itself is a very demanding one. The experience overloaded them, and they were carried down further by the prospect of thinking maybe the C that they earned in 8.02 was a product of their skin color.

I just had such respect for all these kids I ran into. Most of them were excellent students. I think again that you and John Turner were important influences on my perspective. I could go on for quite a while naming names of people who in some significant or day-to-day basis were illuminating my awareness of what it was like to be black in white America.

You have a lot of knowledge about the experience here—much more so than others, I think. There are very few whites at this Institute who over the years have engaged in the whole issue of really connecting with blacks the way that you have, in my opinion. So you also see the part of us that suggests we may be a little off in our thinking about the white world. Where do you see some things that you think in general perhaps we can improve on, based on your assessment of how we have seen the situation? That is, we may term things racist when they may not be, or we may be too hard on a situation because we didn't look at it in another way. Do you follow what I'm saying?

Yes. I think that's part of the burden of being a minority, of being black. I don't actually see that impacting in the same way either with the Mexican-American, Native American, or Puerto Rican kids. I think that the movement sort of, in an understandable way, combines those four sort of gene pools. But I think in any kind of sociological cultural analysis, you definitely would want to separate them out. A black person, I think, is constantly compelled to raise up this filter, “Is this other person's behavior in my direction a product of his humanity? Is he just an ugly, evil SOB? Or, is he a white person who generally speaking is a nice guy, but he's got this attitude because I'm black?”

This is one of the reasons that I have such spirited affection just for somebody who makes their way in life being black. Blacks have this double demand to understand the larger culture and then to understand how to get along with it, being

a sort of picked-upon minority. Sharry you probably remember as a student, now a professor of human development. I think it might have been Howard Ramseur who wrote the paper that I would refer to about the necessity to instruct black children in this sort of double culture. You have to teach them how to be human and, at the same time, you have to teach them how to respond to a predictable racism.

That's one aspect of being black, just that constant vigilance. The intelligence required I can't comprehend. I mean, you've got to have some superior intelligence to be able to keep all of these discrepant feelings somehow in proper balance. I'd go across the street and I'd start to get on the bus. If some bus driver, let's say a white bus driver, shuts the door in my face and pulls away, I call him an SOB. But if that happens to John Mims, he's got to figure this happened because he's black.

I remember one time we were walking over to the Faculty Club. This is an interesting story that I think illuminates my appreciation. We were late for this meeting we were going to. We each had a briefcase of papers and I said, "We'd better run." Then I thought for a second and said, "John, we'd better make damn sure that we are exactly neck and neck. If you're behind me, some police are going to come by in a car and think you're chasing me to steal my briefcase. If you're in front of me, they're going to think you stole my briefcase and I'm chasing you to get it back." It's sort of a representation of the fact that it's essentially a no-win situation, whereas here I am, in effect enjoying all these benefits of being a white, middle-class American. Somehow it's the demand for fair play, it seems to me, that always has been present in my own outlook and attitude about any difference.

But it's what life is like in this country, even in this era. I guess that the answer to your question is that I think a lot of times a black person, friends of mine, have been compelled to see racism where it may not, strictly speaking, have existed. It turns out that the bus driver really was just an SOB or the cop comes by in a patrol car and wouldn't necessarily have assumed that someone had either stolen or was going to steal something. But I think that guard that you have to keep up is what is so demanding of energy. I think of the kind of psychic energy that must be drained off, understanding all this and keeping it in balance if you're black.

That's why when some black freshman came in and said he was struggling with his curriculum, I thought, "Man, if we could illuminate these racist realities, this kid might win the Nobel Prize in six years. I mean, here he is making B's at MIT, while he's carrying not only the typical load but also the load of being probably poorly taught in the third grade, all those kinds of things that one can trace." I see people who all too often don't understand. I shouldn't pick on them. This is, of course, proping me up as the only one who understands how all that works. But I keep thinking, "Isn't it amusing that we all understand the reality of racism in the abstract, but somehow converting it to dealing with a nineteen-year-old who himself is a product of one of these cultural realities, somehow that conversion—making that exchange—seems to be so difficult for some people?" I think it's what I'm always working on and why I think I'm always so inclined to be forgiving. I'm inclined to suppose that the Euro-American culture that came in here and trampled on all kinds of sensibilities, whether it's Native American or Mexican-American or the enslavement of black people, I just think—never mind whether it's a debt—that there's an obligation that each of us as individuals is compelled to pick up and respond to, especially when it doesn't cost us anything.

I was saying to Sharry yesterday that I'm a little uncomfortable about being identified potentially as a white ally, because I've not been in the street. I haven't really done anything that costs me anything. I've sort of done MIT's business for it the way I think the Institute wanted me to do it, and I've been a friend to students and to staff. But it isn't like either financially or somehow psychically I've made some big kind of investment here. I mean, I look at people who have made a big psychic investment—at you and John, for example, whose personal lives are used to some great extent. I go home at five o'clock, put my feet up, and have a beer, while John would be in here till seventy-three holding the hand of some black kid and wondering if we really should have admitted him—"Why not let him go to Howard and have a nice life?" I mean, this is the kind of stress that the black administrators here have felt for years.

There's another area that I'd like to have you focus on. One is related to the whole area of trying to bring more blacks into the administration and faculty. You've watched

this for almost three decades. First of all, are we where you thought we would be, say, during the Mims era? If not, what's your diagnosis as to why we are not where we should be relative to the increase of black administrators and faculty, as well as where those people are placed in terms of positions of some authority?

It does look like we just haven't been able to tap the pipeline, so to speak. It's easy, maybe too easy, to say that this begins in the first grade when the white suburbanite majority is elbowing black people away from the table. This happens as a product—maybe again not in any racist way, but just as this kind of human tendency to advance one's own best interests. So everybody is elbowing hard, but the white people have gotten more advantage in this. They get more of the books, they get more of the goods. By the time kids are fourteen, you can begin to see the fallout. That's the way I explain why even thirty years later now, twenty-five years later, the representation of black kids in the freshman classes still may be half of what they represent in the population at large. An even worse statistical reality is what's true for staff and faculty. I guess I don't think we're coming close to doing the job in those elementary years, to use the school system as a way of defining the chronology. We're not empowering these kids somehow. We're not giving them the tools.

I actually heard a thing about the decline of affirmative action in California which strikes some chord with me someplace. The joking line about it is, "It isn't that white people don't believe in affirmative action, they just don't believe in it for black people." It's like—we white people, we've been affirmatively sort of advancing our own gene pool, if you will, which I think continues this racist attitude and has continued to be at the root of the problem. So you get black administrators in here and black faculty, but when it comes time to make a department head or a director, damn few directors around here have been black in the thirty years I've been here. In fact, I'd be pressed to be able to name any. For vice presidents and so forth, it's like that old line back in the '60s and '70s—when it comes time to replace yourself, you're inclined to get something that looks like what you've been shaving every day. That typically doesn't include women and it doesn't include black people.

I think you have made the point very clear about some of the issues related to increasing the number of black

students, particularly on the undergraduate level. Maybe you can help me have some insight on the graduate level, particularly now that you are in that arena. But let's focus too on the administrators and the faculty. You've watched that process, at least from a distance if not closer. During the '70s, especially, we were able to bring in a few blacks in different areas—the early '70s especially in your area, financial aid and admissions. John Mims came in '68 or '69. During the '70s and early '80s, we came up to maybe thirty or thirty-five black faculty and administrators throughout the Institute. The fact is, if you look again at the '70s and look now at the present, these people basically are either gone or in the same areas and the same places, with very few exceptions. The person may have changed, but the positions are the same. What's your diagnosis relative to why we have not been able to have, say, a black person who may be the director of admissions?

I know exactly what you mean. I am constantly in this mode of self-deprecation—not really putting myself down, but I have relatively little confidence in advancing my point of view. But I think that the answer to your question is that it's got to do with what I was talking about, that we don't believe in affirmative action for black people. In effect, we're willing to be forgiving of ourselves, ourselves being this white population. We know we have shortcomings, but we'll go ahead and hire this guy as a director of communications: I use that example because there's no such person at MIT. We know that he's sort of got these shortcomings and these weaknesses, but we're not going to have to face our constituency, being accused of making the obvious mistake of promoting somebody, putting somebody in that job who was black with these kinds of shortcomings.

It's the ultimate racist inclination, the ability to defend a decision. That's my explanation—that people, when push comes to shove, are unwilling to take that little step. Instead, they say, "Okay, everybody's got strengths and weaknesses and we're going to put this person in here with his or her strengths and weaknesses. But we're not going to risk having somebody be able to criticize us for doing this stupid thing of putting somebody in there who everybody knows wouldn't be adequate to the job, because they're black."

I'm not sure I'm making myself clear. In other words, the black is at least as competent as the white person, but all of their little flaws can then be sort of put down into the column that says,

“Well, this is what you would expect from a black person.” So if you’ve got a white guy in there who screws up the job and you’re his boss, you can shrug and say, “Well, how was I to know that this guy was a nitwit?” But since the whole country in the main is committed still to the proposition that somehow black people are diminished as a general rule, it’s easier to explain away the shortcomings of white people.

I remember the stories about Washington, DC. If you were a Nigerian diplomat in 1840, you were paid a certain amount of respect and dealt with like any citizen would be. But to be a black shoemaker who comes into the city, even if you’re a free man, there’s this attitude that pertains. I never really have understood that. It’s just something that has never aligned, has never harmonized with my view of the way the world works. But it’s easy for me to explain why it is that somebody can’t quite break the glass ceiling or get put into this position of authority.

Now, of course, it does happen around the country very occasionally—and, as often as not, it seems to me, with a considerable amount of success. Who was the man who just died a few years ago, the black guy who ran General Foods or one of these humongous corporations? And the president of TIAA-CREF, until a year or so ago, was black. There have been a number of people who are black in these positions. You’d think that the system would say, “Geez, this does seem to work.” I don’t know, that’s the only way I can explain it.

I think the issue of risk is a very important piece to this whole issue of trying to move to another level. We didn’t do all that well in terms of bringing the numbers up the way I think we could have here at MIT in all of these categories. But now we’re at a point where even those who have been here for some reasonable period of time are now looking at why it is that we cannot, say, have some members climb into the higher level of the administration. One group of people will say, “We have a flat organization. There are not that many opportunities, so it’s difficult to do this.” It could be inside or outside, but again, we’ve made no change. My position is very clear on it—I think that we basically are not prepared to take the risk.

Yes. I may be one of the last people at the Institute who actually got promoted. In 1969, after I had been here three years, I got made director of student employment. It was just about the time that

the search committees were ordered. You could no longer merely promote a staff person, you had to have a search. And the purpose was to find women and people of color whom you could put into the pool. I think the Institute somehow has managed to do that up to some level. There have been damn few hires around here, whether they were white or black, when there weren’t people in that pool who were either female or minority.

I’m not sure it happens up at the vice-presidential and presidential level. I don’t see why it shouldn’t, especially with the senior jobs. There should definitely be a person of color on the short list, because this is MIT. John Slaughter is a friend of mine out at Occidental College. His wife worked for me when I was at Caltech. I thought he should have been on the list when they hired Chuck Vest. He had run the University of Maryland and he ran the NSF. Then we’ve got people on our corporation board, I guess.

I mean, here I am. I’m down there struggling in the trenches over the years and I wholeheartedly endorse the idea of a search, I don’t want to be misunderstood. But somehow why hasn’t the diversity idea sort of pervaded up at these upper echelons? You’ve got somebody in on each of the three-person or four-person short lists. I think twenty-five percent of the pool ought to be black, let’s say. Somebody at some point is going to have to make it happen, it seems to me. But yes, it’s the risk factor and, I think, a kind of hesitancy to hazard some corporate group being able to say, “Obviously, we should do this.”

There’s a little bit about your background that I think needs to be recorded, and that is your family. You’ve mentioned a little bit about it, but could you spend just a minute talking about where you grew up, and your family?

I grew up in Cincinnati. It’s on the cusp of the Confederacy, so to speak. Even when I was a kid, my grandmother would tell stories about her mother experiencing the Civil War. The reality of being black, the reality of ghettos, the reality of having a foot on your neck were clear to me when I was a kid.

Cincinnati was a pretty segregated city, really. But again, my father had grown up in the city and played ball with black guys, so somehow he had an innate respect and tolerance. He was a reasonably educated man—not a college graduate, but a

comptroller in a life insurance company. He was a respected member of the community, on the school board, and so forth. He had nothing but respect that I ever could see for people, period. I never heard either of my parents run down any group, whether it was religious or racial. That's why I don't really have all that much disaffection for people I consider to be racist. Sharry and I were talking about the line in *South Pacific*, about how you have to be taught to hate, people have to be taught to hate. And I wasn't. My mother would tell stories about being bounced on the lap of some black woman in her church when she was a little kid. She would use the "N" word from time to time, I regret to have to report, but I think really almost in more of a descriptive way rather than any kind of a slur. In those days, people did that.

I trundled off to Ohio University. It's interesting, because three black guys on my floor were in their own room. This is sort of the equivalent, I think, of Chocolate City, although I'm not sure how much of a legislation there was that made that happen. But these guys became friends of mine, and there were blacks with me in the Army. So I've had the benefit of that contact. I think a lot of us white middle-class Americans are not inclined to be exposed. A few years ago I sent you that little piece, I think, about the business of biking into work. White males have almost always got a tail wind, being bolstered and blown along. But I think if you're black in this country, often you're driving into a head wind.

I don't know, I wish that somehow more of my fellow Americans would be persuaded just by the sense of fair play and recompense. One of the things I keep expecting to happen is for some group of lawyers to get together and decide to take the United States to court for all the unrequited cost of the labor of three hundred years of black people building this country. Nobody pays much homage to the fact that black people—who represented eight or ten percent of the total population in 1840, thirty million people in the country and four million were black—built the country, contributed to its economic well being, and so forth. Can you imagine how much money you would personally get if some black lawyers sued the U.S. and won, with interest? I mean, it's a humongous number. And then this talk about the cost of welfare and affirmative action is just crazy.

There are not too many people I know here who are white who have the respect that you receive from a large percentage of blacks, so it's very important that you lay out what you want to say about certain things. You're one of those rare human beings. I'm sure John will agree with me on that.

All those years of abuse I took off of him. We used to laugh. Every once in a while John would just get to railing about what it was like here to fight and to be swimming upstream constantly. I'd say, "John—Jesus, you know, I'm the only white guy you know who will stand here and listen to this." Then he'd laugh. But basically, I think I just have been the beneficiary of a great institution. With all of its shortcomings and flaws, MIT is the tops. The people they've hired here have just taken the time to give me an education, both black people and white people.

Take somebody like Sam Jones. I won't go on about it, but here is a man raised in kind of a racist context in Oklahoma and Texas, yet with the vision, the sensibility, and the education really to recognize the need and contribute to my education about some of the specifics of the history of the country and so forth. There are people like that—not quite like Sam, but people willing to take the time to teach all over MIT. That John and you and all the other individuals of color would, despite their experience with so many white people, still have the forbearance to take the time and make the often painful effort to illuminate my view is quite remarkable. I believe that that teaching, and the willingness on the part of the majority to make the effort to learn, is the ultimate and the only hope.

JAMES J. BISHOP

BS 1958 (natural science) LeMoyne-Owen College, PhD 1969 (chemistry) MIT; research assistant, MIT, 1962-1963, 1964-1968; research associate, 1969-1970; assistant to the dean for student affairs, 1969-1970; assistant dean for student affairs, 1970-1973; associate dean, 1973-1978; dean of students, Amherst College, 1978-1983; vice-provost for university life, University of Pennsylvania, 1983-1987; special assistant to the provost, Ohio State University, 1987-1994; associate professor of science education, 1995-1998; assistant dean for research and external affairs, 1998- ; volunteer, Boston chapter, Congress of Racial Equality (CORE), 1960-1965; secretary of intergroup relations, Governor's Office, Commonwealth of Massachusetts, 1965-1967.

Part of my academic challenge was understanding both intellectually and practically what some issues of math and analytical thinking really meant. I was pretty much a disciplined student coming into MIT, and that I can attribute very much to my undergraduate education at LeMoyne College, now LeMoyne-Owen College, Memphis, Tennessee. That part was just a really amazing challenge. The other challenge, once I got involved in the civil rights movement at that time, was wanting to continue in the civil rights movement to help the cause, wanting to get my academic work done, wanting to deal with a young marriage, and wanting to keep in touch with people. There were just so many demands I was trying to balance at that time with little support.

I mentioned desegregation and how in some ways naive and shocking it was for me to come to the Boston area and not be able to find an apartment, but I also had no colleagues on that front with whom I could talk. The white friends in my inorganic chemistry unit—and as a graduate student you function pretty much in a unit—were going through the same issues of getting married, getting an apartment, and getting on with their degree work. None of them could or would talk about my not being able to find an apartment. In one apartment search case, since I knew people could file complaints, I went through the complaint process. Every time we changed houses, which was about every year, we went through the process. Massachusetts passed some laws against discrimination in housing. You could file complaints, but you needed a “tester” for a good case

Edited and excerpted from oral history interviews conducted by Clarence G. Williams with James J. Bishop in Boston, Massachusetts, and by telephone from Columbus, Ohio, 5 March 1998 and 20 July 1999.

to be made. To be able to file, you needed a white person to go and apply for the place and get it. I remember calling up one Sunday morning a white friend of mine and asking him—a colleague—if he would just call the apartment or go by the apartment. He wouldn't do it. He had never thought about doing it before, but he wouldn't. So in that sense I was isolated, I was alone.

I think you could probably find more and more black students at MIT prior to the 1970s, and maybe even into the '80s, speaking of the loneliness of dealing with very special issues. Some of the faculty members I had knew about that issue and were sympathetic to it and were understanding. Some of the rest of them just didn't even want to hear about that issue. They just wanted to hear about the research and the academics. There was that fundamental challenge

that was very much going on with me as a graduate student.

Once I did some work in government and came back to grad school and decided that I didn't care what else happened, that I was going to complete my degree, I was able to put much of the other issue aside and cope with graduate school demands. But as is true of all of us who were of an age of consciousness when Dr. Martin Luther King, Jr., died, I remember that moment vividly. I remember I returned to the lab late one evening. I had gone home for supper. Upon entering the lab, a white colleague, another student, came to me and said, "I don't know how to tell you this, but there's a radio report that Dr. King has been shot." To this day, I don't remember what I said to him. I don't know if I thanked him. He did present it to me, I thought, very sensibly. Rich is his first name; I can't think of his last name now—Alcott, perhaps.

I essentially shut down my research bench. It meant shutting off the vacuum system or putting liquid nitrogen in it and stopping what I was doing, turning off all the heaters. I got my flashlight from my research bench which we used, got in my car, and I went to Roxbury. I knew that, like many of us, our youth were going to respond. We had had other riots around there, so I spent that evening out on Blue Hill Avenue with the organized parent and community group that helped with the busing back and forth to suburban areas. That office had a lot of other older black people trying to prevent our young people from being hurt as they expressed their anger in a violent fashion. We did that for two or three days till things sort of settled, at least right up until Dr. King was buried.

So that's over that period of time. Coming back to the Institute, interestingly enough, I had missed seeing any of the papers—the campus papers—about the kinds of steps that the black students on campus had done right around that same period. So I continued to miss those activities and sought to finish my degree. We're talking '68. In early '69, maybe April or so, I got the message from the dean of students inviting me to come in and talk to him about something. He and the executive secretary of the chemistry department made essentially two offers—a postdoctoral appointment and a position in the dean of students office.

Then another challenge came up. I decided not to work at that time with the man whom I deeply admired and who served as my Ph.D. advisor, Alan Davison. I wanted to work in a different field with research of a different style. I decided to work with Richard Holmes, who had been an older graduate student when I first arrived at MIT. I admired his work as a graduate student, so I was looking forward to working with him for a while.

The next challenge came, and this one was impossible. I just couldn't do both—I should have learned this from my earlier experience—half-time work in the administration and half-time work as a chemistry postdoctoral researcher. After trying that for several months, and enjoying very much and being challenged very much by my work in the dean's office, I accepted an offer to come and work in the dean's office full-time. I decided I would try that and if after a few years I decided I wanted to go back into chemistry, I would go back into chemistry in a research or teaching position. But, as you can see, I ended up for the most part staying in the administration and serving in administrative posts.

So there's really been a range of these challenges. Another challenge came as an administrator. As a black administrator, the students had certain expectations of me—some of which were valid, some of which were unrealistic, many of which needed to be met—and I had to struggle to figure out how to meet them. If students are demonstrating and if you're part of the administration, well, what role do you play in that? You can give some guidance to it. But at least I didn't feel I should be directly involved in demonstrations. I gave students a sufficient amount of information so they would know they were on the right track. When they're very militant, I might say, "Look, that's a good area for pushing, but maybe that's too extreme." So I went through those internal debates being a guider, a supporter, a counselor, an educator, a role model. I was going through all those matters and it was very, very tough.

It's kind of what I think was said in one of our conferences we had, in 1982. I think it was Shirley McBay, the dean for student affairs, who made the point about serving two masters, so to speak. The difficulty in working with students makes it even more extreme in terms of how you deal with it. You were among the first blacks in that arena, and that was a very difficult role.

It was extremely difficult. I think it became easier once there were more black administrators around, in two ways. One, we could share what our views were. We could all come out with kind of a group view of what was right and what was wrong for the group, although we as individuals might hold differences inside. It was in some ways both easier and challenging in another way. It was challenging because we black administrators had different views about issues, and those things got deeply interpersonal at times in ways that other people don't know. We got competitive in a way that African-Americans in small groups in large historically white institutions find themselves. Sometimes the competition was conscious and sometimes probably unconscious. It became difficult for us because students sometimes directly played upon that competition by saying, "So-and-So is supporting this group, how come you're not supporting that group?" But the relief came as we didn't have to feel that our individual decision was the only one affecting everybody. I didn't have to feel I was the only person speaking for the black community. That was in part a relief, as well as a challenge. I think as the black community grew—never large enough—within MIT, it became easier for all of us to work through and think through those issues.

So that became really a tough one. It also became a difficult one because, in addition to being an administrator of the programs, we were all in advising roles in which we wanted students to trust us openly and to share their views of what was going on. And they sometimes couldn't do it.

Another challenge was when we all looked at what's good in the long term and there arose a major discussion that was divisive about what the Office of Minority Affairs or Minority Education should do. One philosophy was that all issues pertaining to minority students, and even all minority employees, should be under that wing. Another view was that it should be supportive of the black community. When you look at it now, one can argue both sides. It shouldn't carry as much political weight, but it carried at that time enormous political and emotional weight within the black community because we all wanted to do what was best, but we also felt we had to be on the same voice on the same issue for all of us.

So regardless of which way one came down, it was that divisive part, I think, that made it hard.

I think it was harder for people in the administration who also had advising and counseling roles. I may be doing the faculty a disservice, but I don't think they were bothered by that quite as much. I may be wrong because I can remember some discussion with them. I can remember when a very brilliant faculty member and I, Jim Williams in mechanical engineering, had a fundamental debate in meetings about this issue. Then some years later over lunch we almost laughed with each other about how we got so riled up about that issue that it affected our relationship in which we both admired each other in many ways. There have been those wide ranges of challenges, I think, that have gone with each of us.

When I left MIT and went to Amherst College, I can tell you the same kind of issues still occurred. There I was in a senior position, actually making some decisions or recommending them to the administration or the board of trustees, and some of those same pressures and expectations continued both for me and for some of the more junior black faculty members who were there. They will go on, I think, for many a year, especially until there is a sufficient body of African-Americans within those communities. We have never reached that crucial size in which we can have sufficient diversity within our own group and support within our own group.

You mentioned a very important point about this whole issue of the importance of having a critical mass of blacks. I remember watching all the major work you were involved in as an associate dean for student affairs. Your qualifications were excellent, particularly for a technical institution, but still you never could get beyond that point to be the dean of students, for which you clearly had all the qualifications. How do you see that?

As you can see, I'm smiling now. There are times in my life I have not smiled and even at times today that I reflect on that matter without smiling. After I had worked in the dean of students office for a while, I came very much to see that that was one of my goals, to be the dean of students. MIT quite generously sent me to that wonderful Institute of Educational Management at Harvard, whose goal really is to prepare people for senior positions of responsibilities. So in that sense I felt ready for it, though I did not sense at the time in 1977 and '78 that such a position would be opening up at MIT. I hoped so and I said, "I either have

to sit here and wait and see whether one will open or take advantage of positions elsewhere.” I really loved MIT then and do now, and I loved Boston. I did not envision myself leaving the greater Boston area, but I was encouraged by Carola Eisenberg, who was the dean of students at that time, and others to apply for the position at Amherst College. I did and I loved the place from the first day I was there. I was delighted that they offered me the job, and I took on that deanship.

One of the challenges is, how does one avoid hating white people? I have to put that as bluntly as I can because I think that’s important. I said when I got to Boston and found all this housing discrimination, why didn’t I just turn and hate white people? Well, I was fortunate in that there was a group of whites in the Congress of Racial Equality who were “testing” and struggling with me in a different way. That helped during that time, although there were others who couldn’t relate to me.

It also helped when we had the debates at MIT meetings. I thought there were white people who were deeply committed to this issue. I still believe they’re deeply committed to it: Paul Gray, Ken Wadleigh, Jerry Wiesner, Howard Johnson, a wide range of faculty members such as Al Hill, and even people who didn’t have major administrative positions but sort of understood, I think, what was going on—Merton Kahne in psychiatry. And there was a large group of them. I think those individuals and discussions with them and people in the offices helped to keep some of my bitterness down.

Now, since that time, they did appoint an African-American woman in that, I think, very crucial position of dean for student affairs. There have not been a lot of other senior appointments of African-Americans around the Institute. That says a lot about a place that you and I admire. We know what it’s done at the student level. The other part that I watched over the years, and this happens when you’ve been around a place, is how MIT seemed to have mentored some people who moved up the ladder very well. From what I know of you and other African-American administrators, many of those people are as capable as or more capable than those who were mentored and appointed. But I’ve not seen MIT be able to find an African-American or two and mentor and support those people in that same way over a sustained period of time.

You were the closest who came to it, and you know what happened there.

That tells you some issues about the place. We have a number of people who have been at the heart of this institution. You’re one of them. You’re an administrator, you know what’s going on, you can see how that happens to nurture them and pick them up and go ahead with them. So although the place has done a lot, you can see how it has slacked off on that area.

I think the other area which has slacked off, as I look over the years, is that I’m not sure the dedicated personal involvement of the top administrators on affirmative action or equal opportunity, whatever you’re going to call these programs, exists now as it existed in the 1970s. Whether the students insisted upon it or whether the administration was committed, the results were that the president, the provost, the dean of students, and others spent time almost weekly at committee meetings wrestling with financial, educational, public relations, supportive measures to get more black students into MIT, to keep within MIT more black students, and to provide them with at least some levels of support. I don’t feel that exists at the place as one could have felt it then. Those are major losses there. We’ve both been there, we both are angered by that. I’m not sure we’re bitter about it.

I’m not bitter, but I have to agree with you. I’m very upset about it.

It would be instructive, it would be a metric—a word that MIT likes to use—to see what will happen to Phil Clay. He has certainly moved up that structure very well. He has been a tenured faculty member, he has been strong, he has played his hand in the right way as an outsider. He has been very, very successful, and what we need to see when those opportunities come up for lead jobs, academic leaders, is what will the institution feel regarding Phil Clay? Or will he have to find his opportunities elsewhere?

With all the experiences you’ve had in lots of places, what advice would you give to black students coming to a place like MIT, which is not that different from Penn and other places you’ve been, like Amherst, and also to young black administrators?

That’s a hard one. It’s a tough one, and I really never quite thought about it that way. I look at it differently now. I’m now sixty-one. I guess I look

at things very differently today than when I was in my thirties and forties. One strategy is for young black persons in deciding—“What do I want to do five, ten, fifteen years from now?”—to make sure whatever they’re doing is heading them toward that goal. That may mean at times not doing immediately some things for the black community and for young black people, but more for their own careers or families. In the long term, achieving those goals serves as a role model for younger blacks. It puts people in a position where they can do a lot more for younger blacks and do it on a kind of a timetable in which people feel, now, this person is just as skillful, just as accomplished as the non-blacks who are in those positions—though it’s very hard.

The next one is that I don’t care where they’re going in this predominantly white institution, they need to spend some time—I don’t mean a few months, but maybe a year—in a historically black, predominantly black institution, a college, university, or community in which the relationships, if they can be found in America anywhere, are a little bit closer to normality and in which the faculty and administration not only support black students but do it in a really nurturing, meaningful way throughout the community, including just the way of inviting folks over and eating, going to parties and dancing, doing all those things. But it also includes folks being able to tell people when they are right and when they are wrong, when they are behind in their work and when they are ahead of their work. I think this gives black students a realistic picture of what they need to do and where they are going. I think that’s very hard for most of us who are African-Americans in historically white institutions to always know, because people give us so many mixed signals and we’re not sure of it.

So those are the kinds of ideas I would really emphasize. The one I hope for most is that they can somehow figure out who they are very early. What are their guiding principles, intellectually, morally, politically? I have been and am a strong Democrat, though I did once work on a Republican governor’s staff as an independent. Part of that was because a number of people felt I could work with different groups and still hold to my political convictions. I have to tell you that working at that time for, I would say, even a modest middle-of-the-road conservative in Massachusetts, I, as a liberal, was in

a very different political climate than in the rest of the country, even in Massachusetts now. That opportunity gave me a chance to work with then Attorney General Ed Brooke, who was the first African-American elected to the U.S. Senate in this century—a marvelous, remarkable thing.

So those quality steps, I really think, are important—trying to find one’s self, getting in the middle of a historically black community and living there for a while, and never giving up one’s own personal long-term goals and aspirations, really just holding to all of those values.

The last advice for young African-Americans is to realize that this is still a racist world. It has changed in some ways, but one is going to find that it influences people we admire and work with, and it influences us with each other and with the rest of the world in trying to deal with racism.

People like Paul Gray and Jerry Wiesner, my colleague Mary Rowe, this whole group of people you could say are a little cut above a lot of the white people we deal with. But it seems like even the best tend to have something they don’t quite understand as to what we actually see.

We’re all victims of racism. It infects all of us. It infects the way you and I as black men interact with each other. It infects the way we interact with our white colleagues and friends and people on the street. When you get white people saying, “I see a black person, but I don’t see color,” we know that’s not true. But they say that. I’m not sure it’s any of the people you mentioned, but some of the most meaningful white people say that to you, and we know it’s just not true. Psychological studies, I think, show that that’s not true—white people see African-Americans as black people!

I don’t know whether our expectations of some of the people we talk about have been too high, too unrealistic. Sometimes our goals for ourselves and our fellow African-Americans have been too high. Although we’re all victims, I think we’re all still human and I hope—I sincerely hope I’m not bitter here—that we can still keep in mind from our Judeo-Christian backgrounds that we all have some errors, some shortcomings. We’re frail in some areas, we’re strong in others. I hope in the end we can push, be militant, but be reasonably forgiving as I think we can try to be with others.

To go back a little, I think one of the things that would be very helpful is if you could talk a little bit about your

childhood, your family, and your early education before coming to college.

I'm chuckling now when you say "early education." I just got back from a high school reunion, my forty-fifth. That made me think quite a bit about how much life has moved and changed over the years.

I grew up in Memphis, Tennessee, back when that part of the country was highly segregated. I grew up in a family in which my father did not finish high school, except by what we nowadays would call the GED, general equivalency exam. But both my mother's parents had gone to college—to Lane College, in fact. My father, who lived in Natchez, Mississippi, came to Memphis and was surprised to learn that in Memphis African-Americans could take the examination to be a postman. He took it and passed it, so through that we had a reasonable lifestyle, until he got sick. When he was sick, my mother had to work taking in laundry for awhile and then she served as a substitute teacher. She had to go back to college—she had finished LeMoyné College earlier—because her degree was not from what I guess you would call a recognized, accredited college at the time. So she went back and got another degree and then taught fourth grade for some twenty-odd years.

I went to kindergarten, and the thing I always joke about is that I was a kindergarten dropout. Apparently, I did not want to go to kindergarten. My sister, a fellow postman friend of my father's, and a lot of other people along the way would get me going from home and push me through the neighborhood as we walked to Mrs. Potts's kindergarten about a mile from our home. For some reason I didn't like that place, although all my memories of it are quite pleasant. At some point, I guess, my parents had a discussion in which Mrs. Potts and someone else said, "That boy Jimmy Joe ain't ready." So I dropped out of kindergarten.

Then I went to Lincoln Elementary School in Memphis, a relatively small elementary school compared to many of the others in Memphis. It was right in the heart of the very poor neighborhood where we lived, and where my mother, who is ninety-six, is still living. From Lincoln Elementary School, I went to Booker T. Washington High School. Booker Washington was one of about four or five high schools for "Negroes," as we were designated at that time, but it was in many ways one of the best—at least we thought so—and

one of the more progressive. It had as its principal a very distinguished gentleman, Reverend Blair T. Hunt, well known in Memphis and throughout the South because of his strength as a principal and his ethical and moral and intellectual leadership, but also for his effective political skills in getting things for his high school. When we're looking back on these years now, it looks shameful and people might not believe us, but Booker T. Washington was the first high school for blacks that had a lab and that had Latin. It had a number of things of that level, and part of it was Mr. Hunt's political skills in insisting that these things come into the high school.

How did you do in high school, academically?

I did well in both high school and elementary school. I was about second or third in elementary school. My high school class had over 450 people in the regular class, plus a night school, so I think we had over 500 people graduating. I was number 10. Except for kindergarten, which I don't remember anything negative about, I enjoyed school. I really wasn't an exceptionally serious student until I got to college, where I worked much, much harder.

How did you decide what college you would go to?

One of the fortunate parts in my family life was that my mother's aunt, my great-aunt, who had gone to Lane College and then out to Oklahoma to teach, provided some funds for us on a monthly basis for saving accounts. My mother's mother, my grandmother, who was working in Chicago, also did that. So from the very early stages in my life, my brother, my sister, and I—the former two a bit older than I am—all knew that we could go to college. That really made a big difference. We could aspire for occupations based on a college education. Although the money that was saved was not a tremendous amount, it was at least enough for all of us in our family to be confident that if we did our work—our academic work in school—then we would be able to go to college.

My late father and my mother had lots of friends around the city, as she does now. Included in that were some dentists who would clean our teeth regularly. When I was in maybe late elementary school, and certainly throughout high school, I wanted to be a dentist. As I looked at my high school annual year book, when I was down there at the reunion, I realized that that was one of my

ambitions. So my first year in college, I took what would have been the pre-dental course. Then a little later I decided I wanted to be a physician, a medical doctor. Then I firmly decided, after having been inspired by some of my science teachers and by enjoying some informal work equivalent to being a TA, that I wanted to teach chemistry.

That was my career aspiration progression through college. Because I wanted to go into science and had done fairly well in elementary school, I was grouped. Schools in those days “tracked” students. The students in high school who had the best grades from elementary school got into the 9 1-A, 2-A, 3-A, 4-A’s, and other students were in higher numbered grades. It wasn’t always handled exactly that way, but it was close to it. Some of the placement also had to do, as I later learned, with what kind of influence parents had, the extent to which they could say, “I want my child to be in this class.” And one other factor, which was present in those days and is probably present now, was that if one’s parents were doing well, the school officials insisted that their sons and daughters do well. So they placed me and such students in classes that were sometimes much more demanding.

One of the things that was a requirement at that time was for most young men to take mechanical drawing. But since I wanted to be a dentist, my mother and father insisted I take a class in general science, which was generally not taught to students in the lower numbered sections. They actually let me into what turned out to be a wonderful class. It was great to know that Mrs. Ingram at that time was ensuring that everybody in her class, whether they were in 9-8-A or 9-1-A, learned science very well. That gave me a different appreciation for it.

I’ll give you one episode about how those things worked together. What I enjoyed most about that class initially, when I sat in the back of the room, was some of the great jokes by the guys who seemed to be older, certainly more sophisticated and more worldly than I was. I took the first six weeks’ exam and got a low grade in it. It must have been a low B or maybe even a C. I remember to this day Mrs. Ingram giving me that paper and having a conversation with me—either right on the spot or afterwards, I don’t remember when it was—and saying, “You can do better than this.” She placed me up front, not because I was doing well

but because she knew I ought to be doing better. Then I started to get very serious in that class.

We had, I thought, very committed, very capable, and very demanding teachers on the whole. These reunions bring a lot back. We were thinking about Mrs. Gassaway, who taught the math classes. We were thinking about a man we called “Poppa” Lowe, who taught chemistry in a very, we thought, challenging but encouraging way. We can remember Mr. John Wesley McGhee, I think was his name, who taught Latin to us, and demanding. So we really had excellent classes.

Near the end of maybe our junior year, some of the high school teachers and counselors started to look at youngsters who were doing well, who they thought should go to college. Then they gave us some practice on standardized tests and on vocabulary drills. I took some of those and received scholarships. They weren’t full scholarships at that time. I had also been very active in the band, and I received, I think, a couple of band scholarships to colleges in Arkansas and Alabama. But because I wanted to go to dental school, I assumed and started very early thinking that I would go to college locally at what was then LeMoyné College, a historically black institution, and would go off for post-college work. I was very fortunate in that my grades and my work on examinations led me to receive a four-year full tuition scholarship to LeMoyné College.

LeMoyné was a wonderful experience. It was then a very small college, and is a small college now. I think we had about 406 students at LeMoyné when I was there. As I said earlier, my mother had attended it, my brother graduated from LeMoyné, and my sister, who graduated from Talladega College, I think, had taken one or two summer classes there for her teacher’s certificate or to make up some part of her diploma work at Talladega. So it was a school that has very much been in our family. It was at that time the only institution of higher education in Memphis that would enroll African-Americans. There was a public university there—Memphis State, now the University of Memphis—that did not admit African-Americans. There was a private, four-year college, Christian Brothers College—now Christian Brothers University—that at that time did not admit blacks. There was, I think, a small Catholic college that also did not. So if you were in Memphis and you planned to go to college, you

planned to go to LeMoyne College in Memphis or off to the historically black institutions, private and public, in the South, or to a very few private colleges and a slightly larger number of public institutions in Illinois, Iowa, Wisconsin, and California.

So LeMoyne was a very logical choice for me. I also think it was the right choice for me. I don't think I was psychologically or emotionally prepared to go off to college. I remember when we had to take the scholarship exam for Fisk University and make out some paperwork for that, I kept procrastinating and my parents really had to push me to do that. I have a feeling now I just didn't quite want to leave home at the time. I think one of the reasons for that was that my father had been ill—quite ill, deathly ill—during much of my elementary school days. When I was in high school he recovered, thanks to the miracles of better surgery and antibiotics like penicillin that got rid of the infections in his lungs. He was able to go back to work somewhat—not fully at the post office, but to do some work around the city. That was a very happy time to be home. I think I wanted to enjoy that experience, and indeed I did so by attending LeMoyne and staying in Memphis.

There were other ways in which LeMoyne, I felt, was wonderful. It gave me just great personal attention from the teachers who were there. The staff, obviously, at the high school was all African-American. The faculty and staff at the college was actually a mixture of African-Americans and whites, with one or two Asians. All students had black and white teachers. It became my first experience as a black person of interacting with whites who treated me with full dignity as a student and as a young man. When I worked in jobs at a dry goods store and picked cotton for a while and cut grasses, we were always treated on those occasions pretty much as second-class citizens. Those class distinctions were always out front, and if you looked as if you were crossing them, someone was clearly there to remind you of it. But that was not the case, for the most part, at LeMoyne-Owen College. The teachers were open, the teachers were direct. The white teachers and the black teachers lived on or near the campus. They invited students to their homes. We went with them out for activities. And the cultural climate changed. LeMoyne College's auditorium and later its gymnasium, a good size for a place that small, were

almost the only places in Memphis where integrated audiences heard plays, heard international speakers, heard internationally renowned musicians such as, I can recall now, Leontyne Price.

That, too, broadened my cultural and intellectual environment. Teachers at LeMoyne, as teachers did at Booker T. Washington High School, pushed me and stimulated me and helped me. I found myself in college being much more serious about my work, and it was there that I found myself developing what I thought were some fairly good study skills. My grades were quite good in college. I graduated from LeMoyne “with highest honors and distinction.” But I also got involved in student government there. I was at one point president or chair of our student council and interacted with a number of people.

Put some years on that, from elementary school up to college.

I finished elementary school in 1950. You can sort of work that back, I guess, to my starting around '42 or '43, which is another interesting phenomenon. I was going into elementary school as World War II was ongoing. Part of my high school experience was as the Korean conflict was taking place. I finished Washington High School in 1954 and went immediately to LeMoyne College. I finished there in '58 and went to MIT.

You really did come not only from a family with a very strong educational background, but also your surroundings, if I hear you correctly, were very inspirational to you as far as education was concerned.

There were a number of places that did that—the elementary school, the two churches in which I was involved, the high school, the college, and, I think, the general community. My father was strongly active—very vigorously active—in Morningview Baptist Church, which was on the street right behind our house. We could go through our back lot, where at one point we had chickens and at another point we had a little garden, to go to Sunday school. I went there every Sunday morning. At church there were activities for youth. We learned the verses, interpreted the lessons, delivered our speeches, and were involved in other issues there. Even in that church, really in a very poor neighborhood which has gotten even poorer since I left it, Morningview Baptist Church encouraged education in school, gave recognition to youth, and encouraged people who went on to

high school and to college. My mother's church, Centenary Methodist Church, did similarly, but I was not as active there in some activities as I had been in Morningview Baptist Church.

But I think a key feature, at least for me, is that although my mother had gone to college, my father in many ways was inspiration for us—my brother, sister, and me. He was the one who in a kind fashion kept us thinking about our academic work. He loved to read and he read often. While he was ill in a sickbed in the house, I had many discussions with him. In the days prior to TV, we would listen to the radio and talk about those programs. We would talk about some of the classwork that I had to do. I can remember a discussion I had with my father before he passed in '88, which I had almost forgotten. During the discussion, he triggered my memory. I had to write a paper once and he reminded me how he had asked me a number of questions to get me thinking about this paper. This was either the high school or elementary school, and I got a very good grade on that paper. The teacher actually raised questions about whether I had written it.

There were other things that my father did, which may say something about my personality and about his personality that my family always jokes about. When I was just learning to count, they would give me some coins—a lot of pennies for house chores and everything else—and he would ask me to count them. I would get up to a certain number and I would tell him what I thought it was, and he would say, "Are you sure?" And I would go back and count them again. I got a lot of practice, but I guess eventually I got a little confident that way. I have to tell you that one of the techniques I use in my classroom, when students give answers, I start by saying, "Are you sure? And what are the reasons for that?"

So those kinds of encouragements took place. The key one was having the support in the house and really having the confidence that finances would not be a burden in my going to college. That, I think, made a difference. That became so evident from this class reunion. Out of the nearly 500 people, we had around 60 or 70 people there. I was reflecting on my elementary classmates and what happened to them, and on who went to college. In my neighborhood, given that there were so few college graduates and given how poor the neighborhood was, not nearly as many of my ele-

mentary classmates went on to college as I would have thought. There were some, but the numbers dropped down tremendously. However, in some of the public housing institutions—which were closer to the high school, and in those days you still had, the way the arrangements were made, a fair number of African-American college graduates were living in public housing, even though they may have been teaching school and the like—there were more role models in some ways there than in some of our other low-income communities in the area. As one person talked about this past weekend at the reunion, when people moved from neighborhoods into public housing, it was clearly a step up in housing environment, in social setting, and in the availability of nearby institutions. The YMCA was near some of the housing projects. Again, these were all segregated. Swimming pools were near public housing projects, and they were not in some of our very rough neighborhoods. So quite a few things have changed there.

One of my high school mates, whom I didn't know very much in that large high school class but got to know very well in college, was Marion Barry. We were in high school together, graduated in the same class, and were very close together in college, both of us being chemistry students working together and both receiving assistantships to go to Fisk as graduate students. Marion elected to do that at the time and I chose to go to MIT.

He was quite active. He really got started with his activities in politics at LeMoyné, because an event that affected many of us occurred. We were still in the throes of trying to get rid of segregation. The city had a segregated bus system. There had been a suit against the city, led by the NAACP, against public segregation. The lawyer who defended the city was a trustee of our college. He said in his defense of the city's practices some things which we heard, since many people in our community, including our college, went down to this trial. He said some things that we thought were demeaning of Negroes, African-Americans, or blacks. Our local campus chapter of the NAACP, for which Barry was the president, sent—if you look at it now—a fairly mild, polite letter. I don't know if it went to the chair of the board of trustees or to the president of the college, but the letter essentially requested that this gentleman, if you wish to call him that, step down from the board of trustees of a historically black institution.

I have to tell you that all hell broke out when that letter was published in the student newspaper and then in one, if not both, of the city newspapers. I think Marion came close to being expelled, which I didn't realize until later, with people at the college trying to put him out of school. But the president of the college at that time, Hollis F. Price, a wonderful man, held to principles. Marion had not done anything wrong, he had exerted his rights as a student, he was a leader. And Marion stayed on in that school. That was a very good lesson for me and other students. Many of us were really worried. As another colleague said, Marion didn't have as much support at that time as he should have. As far as those of us on the student council in those days, I don't remember whether we passed a very explicit resolution endorsing the action by the NAACP. Those of us in the NAACP supported it, but our names weren't on the line, as Marion's was. He did very well, and without the public support from me and other students who had voted for the letter to be sent.

There were other parts of my LeMoyné days that I think were very, very helpful. In many of our classes—I can cite two examples—the faculty members raised, in subtle ways sometimes but in direct ways others, arguments to counter segregation and arguments to counter feelings of inferiority. Dr. Walter W. Gibson taught our zoology class. He was an international authority on spiders in the Tennessee Valley area. There were not a lot of jobs available for blacks with Ph.D.'s and for black scholars, except at the historically black institutions of the South. And I can remember, as we would be discussing various things, that he would say something relating to race. One time he pointed out—I'm not sure what the topic was—that apes have thin lips not thick lips, that apes have straight hair not curly hair. Throughout the South—in literature, in cartoons, in jokes, and all of that—folks were trying to make African-Americans be so closely identified with monkeys and apes, and whites be as separate from those animals as possible. So Dr. Gibson's just pointing out ways to build up our confidence, to allow us to fight off whatever feelings of inferiority might be within us, and to counter scientifically other arguments was one of those sustaining, enlightening and, I really think, growing experiences that African-Americans do not get in historically white institutions, predominantly white institu-

tions. They might, but I have a feeling people may say it's not needed or they may be uncertain about doing it. But they did it there at LeMoyné.

My American history teacher, Clifton Johnson, grew up in the hills of North Carolina and spoke with an extremely deep, white Southern accent. I speak of him, as I do of all my college professors, with affection and with admiration and with gratitude, so the comment I make to you now is more a physical characteristic. When Cliff Johnson would get really talking about history in his accent, his neck would actually redden. But if you'd know Cliff Johnson, he taught us more about what the Civil War was all about, about how the Ku Klux Klan got into power, and how blacks who had a good deal of federal positions right after the Civil War lost those as Northern whites and others compromised and then allowed resegregation, resuppression, and recolonization of African-Americans in the South to occur. So Johnson also taught us how to understand the Constitution.

And all of our teachers worked on our writing, our speaking, our science, our historical backgrounds. We felt we were doing very well at LeMoyné-Owen College, and I think the college did remarkably well in taking us from where we started to where we left. Nearly everybody at the college got a teacher's certificate, because those were the jobs that were available in the South. You could be a teacher or a preacher or go on to medical school, dental school, law school, or morticians' school. There were not many people going into business, as we have fortunately now so many African-Americans doing. So the job of choice, the job at least for support and security, was a teaching position, and most of my college schoolmates took some time to get their teaching certificates.

How did you happen to come to MIT after college? What kind of experience, as you recall it, were you exposed to here versus the kind of experience you had had in Tennessee?

Somewhere between my sophomore year and junior year, around that time, I decided I did not want to be a dentist and I did not want to be a physician. I really wanted to be a college faculty member working at a historically black institution. I knew from the role models and others in college by that time that that meant I needed a master's

degree and a Ph.D. During my senior year, we had some information about career counseling, but not really a lot there. I didn't quite know how to go about it. I had to apply to a lot of places. Also, I knew I needed some finances. We had saved some money in the family, but not as much for paying for a graduate program as I knew would be the case. What I did not know at the time was how common, at least in those days, it was for most chemistry students at major graduate schools to get a research assistantship or a teaching assistantship. I really didn't know that, because of the limited experience my peers had in going to graduate schools.

I applied, I think, to over twenty universities. I got books about these universities and I looked at their programs. I was interested in either radio-chemistry or inorganic chemistry, so I wanted to know, did they offer those programs? I did not know then that you really try to choose a graduate program in part on the basis of the research programs at those institutions and other factors. There were very few teachers at my institution who knew much about MIT, so I applied primarily to state institutions in the North. I applied to only one Southern institution, and that was Fisk University—Fisk College, I think it was called at the time—which had granted, actually, research or teaching fellowships to both Marion Barry and me. I applied for lots of those assistantships, which meant a lot of paperwork, a lot of essays, and a lot of letters of recommendation sent for me by members of the college.

People were extremely supportive of me. I applied to Stanford out West, MIT and Boston University in the Northeast, and the Carnegie Institute of Technology and Illinois Institute of Technology. I don't think I applied to Northwestern, but I did apply to the University of Pittsburgh. It was a wide range of these. As you look at those, you could see that here I was, a person who was almost using a shotgun effect in applying to all of these schools. I knew I needed money and I wasn't sure about the programs.

I was granted admission—and this is not being boastful, but my grades were good and the recommendations were good—to all of the institutions to which I applied. I received some form of financial aid, usually in the form of a research assistantship or teaching assistantship, from all but Stanford. At the same time, I had applied for a

Danforth Graduate Teaching Fellowship. That was for young men and women who wanted to be teachers, who had some religious convictions, who had moral convictions, and who were very much dedicated to returning after graduate work to teach somewhere in the United States. So after getting the Danforth fellowship, much to my surprise and delight, I was able to go to any college or university I wanted. The fellowship could be applied to all of them.

So that opened up where I might go. There were interesting debates at that time within the family, within the college, and obviously within me and within the woman I was dating at the time, about where I should go. The real question was—and it almost goes back to that question I said about kindergarten—"Is Bish ready for MIT?" (At that time they were calling me "Bish.") I had really narrowed it, I think, to MIT, Carnegie Institute of Technology, and one other institution. I can remember so well how many people would come up to me, including the president of the college and others, and talk about some institutions, but not MIT. A few others would talk about MIT and the other teachers would talk about the spectrum. Part of the issue for the college itself, I think for LeMoyné and its faculty, was how prepared were their best students for going to these other institutions? But the good part about it was that people were caring. They wanted me to succeed, they did not want me to fail. They had seen some graduates, as in the case of all colleges, go off and not make it. They also, I think, did not want any poor reflections on their own school.

There were two faculty members I can remember, maybe three, who had roles here. I believe Dr. Gibson was not directive in his advice. He talked about programs and he talked about what he thought I could do, but to this day I do not remember him saying which of the institutions I should go to. He mentioned all that were very good. He had done his work, I think, at Iowa or Illinois, one of the state schools there. But Clifton Johnson who taught me history, a white fellow, and an art teacher who left—Reginald, I can't remember his last name now, maybe Morris—were the ones who really pushed MIT. I recall one of their points was, "If you don't try it, you'll never know." And that, plus talking to others and reading and looking at MIT's program, convinced me to give it a try.

So I applied, was admitted, and made the decision maybe in April or May to go. And I'm glad I did. But it was a great jump—a quantum leap, as scientists would say—between LeMoyne-Owen College and MIT. After being admitted, I looked at our curriculum, I looked at the courses I had to take, and I looked back on the classes I had taken at LeMoyne in which I thought I was very good, and in which I thought I was very weak. I didn't think my physical chemistry background was very strong and I didn't think my inorganic experience was very strong. But MIT had qualifying exams that all doctoral students in chemistry had to take on the first few days you were there, before classes started. I had to take this battery of three exams. I had studied quite hard that summer. I went back to my organic chemistry book and covered chapters alone that we had not been able to cover in my class. Fortunately, the textbook—by Fieser and Fieser, a wonderful book—had the answers in the back, so I could study the questions, check the answers, and see if I was correct. I had pretty much given up on doing much in physical chemistry, because I thought my background there was just too weak, and I was going to retake that class.

As it turned out, the only one I passed was the organic chemistry class. The other two exams I flunked. Failing those exams, it turned out, was the first time I could recall failing anything in college or high school or elementary school. I had been an okay student. Life had gone well and I had worked on it. I cried. I really cried about that, but I stuck it out and stayed with it. My advisor, Frank Albert Cotton, told me the situation in what was in some ways not, I would say, reassuring, but he placed things in perspective for me from a racial and a personal point of view. There were also some white guys who failed and some of them also failed more than one—not a lot of them, but a few did.

There were very few African-American students in chemistry or in any subject at MIT at the time. In chemistry, in my entering class, there were two of us. There was John Hopps, who finished Morehouse College and had a strong and superb background. He went on to get his Ph.D., I think, in nuclear chemistry. I'm not sure what John is doing at this time.

He's supposed to be retiring from Morehouse College at the moment. He went down there as provost.

So John and I went through it. We had some classes together. We had a class in thermodynamics, which he did very well in. He had been taught by McBay, as you know, for whom a program at MIT was named. John had an excellent background in calculus. I had done alright in calculus, very well by LeMoyne standards; I got A's in college math classes; but I didn't understand it well. I didn't understand it conceptually. I didn't understand how to make applications of the science and the math that I had had before.

So MIT was a major transition for me. I did study hard that year. They said, "Go back and take some undergraduate class and be a TA in freshman chemistry." I learned an awful lot from those subjects. Here I was taking physical chemistry with undergraduate juniors and seniors at MIT. There were a few other graduate students in there, but that's when I really learned to study an awful lot more. Later in the year, I did pass those qualifying exams.

Then we had to take our orals. The first time, we had to select two research proposals. One of them I wrote well and answered the questions and passed it. Another one, I don't know how this happened, somehow I missed a research article. So what I was proposing had actually been done by someone. It was apparently alright, but it had already been done and therefore was not acceptable. I had to redo that and pass it. So the first year was a very strong sense of transition.

Later, I became close to some faculty members. Many of the older ones have passed. This included a gentleman, Charles Coryell, who died of cancer quite some time ago, and some who are still there now and others who left MIT and moved elsewhere. So I had a range of people whom I knew. One of the faculty who handled 5.01 and 5.02, I guess it was, the basic freshman chemistry class that all MIT students had to take at that point, was C. C. Stephenson. Somewhere in my first or second year, fairly early on, he told me that they had looked at my grades and they had never had anyone from my college attend MIT before. You know well that colleges like to compare applicants with folks who have come before. Since they didn't have anyone, they said, "Let's try him." So I tried MIT, MIT tried me, and I'm glad we both did that. For Morehouse, they had had experience with it and they knew how well Morehouse students could do.

Let me mention another experience that occurred when I went to MIT. I had been up North before. My grandmother and step-grandfather lived in Chicago, so we went up there some summers. There you could ride anywhere you wanted to in the bus, there weren't signs saying "water for colored" and "water for whites," and you could go to the movies and do the things that others had done. Although housing was still segregated in Chicago and there was major job discrimination, at least the public accommodations and transportation issues were not as evident there.

My trip to Boston involved another transition. In those days, we went by train or by bus. It was leaving segregated Memphis on a segregated train, getting to Washington, DC, and changing into what at that point would have been a desegregated change. A lot of people were applying for housing at MIT, and they didn't have much graduate housing. What is now Ashdown House was the Graduate House at that point. I applied for a room. There weren't enough and I didn't get in. So immediately getting off the train, taking a taxi across Back Bay to MIT and checking in, I had to apply for housing, didn't get it, and said, "Now, what do I do?" There was a housing office at MIT at the time. I think it was in Building 7. They gave me information about how to apply for rooms.

Well, I discovered that Boston, this cradle of liberty, was segregated in housing. I looked in Back Bay. There were no homes available for me, no apartments. I rented a room near MIT, just near Inman Square—a very small room, where I had to share a bath with the black family. There was really that important black connection right into the community, but it reminded me again of how our nation treats African-Americans and where those coming from the South find support. That aspect I somehow had not quite expected.

Within a week or two, or maybe it was within three weeks or so, an opening occurred at the Graduate House and I was able to move into it. I got a room assignment. The first two people who were assigned to live with me—they were white—moved out. And so did the third one later. One guy just came in the room and walked right out. I never saw him again. He said hello and I'm not even sure he introduced himself. Another fellow was sort of polite and courteous. He introduced himself, but then vanished. I saw them all again in the Graduate House. Another fellow came in and

stayed for a while. But I was getting up very early, studying for exams. He had had a background at Harvard and I guess he felt pretty comfortable about his background, so he could sleep in. My alarm clock woke him up a lot and we had one of those real roommate conflicts. I'm not sure, but I think he moved out because of that, not necessarily because of race. Then I was assigned an Indian roommate—from India, the nation—and he and I roomed together for a year.

So I learned quite a bit about Boston, about Cambridge, about myself, and about MIT in those first weeks at the place. John Hopps was in Graduate House. We did a little bit of homework together. There was one other African-American I remember—there may have been a few more, but there were not a lot of them—and that was James Mayo, who was in physics. Jim was very active in Graduate House as a leader and as a supporter of new students. So that realm was very, very helpful. But other than that, if you walked the corridors, if you went through Graduate House, if you went around the labs, there were almost no African-Americans to be seen or heard, except in the physical plant area.

On the graduate level, there were fewer than ten of you in the entire graduate program.

At that time, there were very, very few and we were all isolated. If we didn't link up in Graduate House or see each other and speak or something like that, they didn't pull you together. Graduate school being what it is, your connections are mostly with folks in your classes or in your research group, and you don't get a chance to link with quite as many people.

That's quite a different experience from Tennessee. You're talking about what year?

I came in 1958.

That's a major achievement for an African-American to be admitted to MIT in 1958 to the graduate program.

The good part about MIT's history is that a few faculty admission committees, not being pushed by law and not being pushed by the institution, said, "Let's try somebody." I'm assuming, though I don't know for certain, that they knew my race. Had the admissions committee in chemistry at that time not known my race, they might have just said, "Here's another small college from where we've never had anybody admitted." That, in fact,

might exactly have been what the case was. I don't know.

As I reflect now on that conversation I had with C. C. Stephenson, I don't think it had the racial element in it. I assume, given the huge amount of stuff that MIT asked for at that time and the pages from the catalog, that there was enough information in there for them to know that LeMoyné was an African-American or historically black institution. But it was years later—ten years later, with the death of Martin Luther King, Jr.—before a major push occurred at the graduate level and at the undergraduate level to get more African-Americans as students, followed by more African-Americans trying to work with those admitted students at MIT.

There were people—not only the faculty, but in the administration and in the student body, African-American students—who had a major impact on me personally, academically, professionally, and politically.

Give a brief summary and analysis of your perspective on the MIT experience.

I saw it obviously in different capacities, first as a young graduate student immediately out of college. Then, as you know, I took some time away—initially a year—and went and taught at Atlanta University. Then I returned to graduate school for about a full year, not quite that. Then I worked for two years on the governor's staff in Massachusetts. Then I came back to MIT and finished up my Ph.D. That gave me a view as a more mature graduate student. Then I was an administrator for a number of years and, finally, an alumnus doing some volunteer work on various committees at the place.

Overall, I think I've looked at it from different vantage points. From each of those points, you see some things of MIT that are the same. For example, one always sees it as a place with some very, very talented and accomplished people in all roles. With students and faculty, staff, administrators just across the line—from folks who work in housing and dining to the campus patrol, to the alumni, just at all levels—you see MIT as a place that does fantastic work by, on the whole, people who outwardly are very confident in their work. That's one view you see.

You also see it in some ways as a special place, as a place that because it is so centered around sci-

ence and mathematics and engineering, has a lingo and a style that I think is not common in many other institutions. To be successful and comfortable at MIT, you have to be able to participate in that. It doesn't mean that everyone needs to be a mathematician, but you at least need to know that if you're at MIT, people expect some quantitative data to support arguments, whether one is addressing an admissions policy, a financial aid policy, or a location of a building. You've been in with the president and worked with the chair of the Corporation. I'm sure you see that occurring at those levels as well as one would see it at the administrative or the counseling or the academic levels.

One also sees over those years, as I have seen in many other institutions, that it's a predominantly white place. That sea of white, for those of us who are African-American and black, puts it in a different perspective, regardless of our skills and whether or not we are comfortable with science and math. It requires other adjustments on a daily basis, other changes, other steps of always walking between—as Du Bois put it—"two worlds," the world of African-Americans or blacks, and the world of American whites.

Plus, MIT is a place that is enormously resourceful. Even in some of the tightest times I can remember at MIT about money and finances, when things were being cut way back, it still had so much more than all of the other institutions that I had attended as a student. It was even more resourceful in lots of ways than the University of Pennsylvania. Thus, when you are working at MIT or are a student at MIT, you can think pretty big in many ways. If you've got great ideas and you can persuade people that they're worth carrying out, you can gain a lot of support for them and they're apt to work. You just don't get into those hassles often on the lack of finances that stops talk and thought.

I enjoyed my days at MIT. There were some tough times as you know, having been there even a longer period than I have. But I enjoyed the challenges. I enjoyed the changes, which you and I and many other African-Americans at all levels participated in. I enjoyed meeting a range of people—students, faculty, staff, alumni, a few Corporation members, visitors who came there. I enjoyed going out into the cities for some short recruitment visits for MIT. So in that sense, I thought it was an enjoyable experience.

For me, it was also a very growing experience. I think I grew up intellectually, politically, and professionally at MIT. For that, I think I'm quite grateful. It has made a difference in what has happened in my career, in other places and at other times of my life. It was at MIT that I established some long-lasting, warm friendships with many people. So all of those are ways in which I look back upon it as really positive.

There's another part of my view of MIT which may seem cynical, but it seems to me that, as an African-American who was there as a student and particularly as an administrator, if we put together all of those resources, all of those talented people, all of the prestige and impact and weight that MIT and its members carry, it never fulfilled its potential and its promise to African-Americans. Although it started, and I think did a really fine job—ahead, as you know, of many other institutions in recruiting students—the Institute seems never to have reached, I think, even a modicum of success with faculty. I think the progress with minority students has been stellar at MIT. By minority students here, I clearly mean the collection of African-Americans, Hispanics, Native Americans, and other groups which until the '70s had been highly underrepresented, almost invisible at MIT. The numbers I have seen, as I've been on the Corporation visiting committee for undergraduate education and students, have shown me how much things have increased for Hispanics and, I think, for Native Americans in ways that one would probably not have expected earlier—and also for Asian-Americans. But for African-Americans, the progress started, it went up, and it seems that the numbers then leveled off and in some areas went down.

You're closer to those numbers than I am, but one would certainly think that by this time we would have a much more substantial cohort of African-American faculty members at MIT. One would have thought that if the Institute could not recruit them elsewhere, it could have grown them in-house. And as we look at African-American students who have done their undergraduate work there and those who have done their graduate work there—and some students have done both—one would have thought that in all of our fields there would be a higher fraction of African-Americans, a higher set of numbers of African-Americans within the tenured positions.

Now I've been out of the place, so I don't know what's been the actual pattern, but I believe we've had a number of African-Americans come in and not succeed in getting tenure at the Institute—or for other reasons decided it was not a healthy climate for them, and they left. So of all the positive things I can say about it, I still have this wish and this disappointment at the potential, at the promise, at the commitment that began really in the very late '60s and was reinforced in the '70s with programs, with people, and with resources that have not yielded the results we hoped for. The potential has not been fulfilled and the hope and promise have not come to be as we wanted it to be.

You have had high-level experiences at several of our major universities in the country, so you've also seen it from the top in terms of these particular institutions you have been a part of. Based on all the wealth of experiences you've had—not only at those institutions, but also here at MIT—what could you say that you think would be helpful to an administration here, relative to this whole issue of increasing the number of black and other minority faculty members in this day and time?

Two points on that. First, I have worked at other institutions across the country, both historically black institutions and white institutions. I was at Atlanta University for a short period of time and did my undergraduate work at LeMoyne College, where I'm now a member of the board of trustees. I was dean of students, as you know, at Amherst College, then vice provost for university life at the University of Pennsylvania, and then served in the provost's office here at Ohio State as a special assistant to the provost for a number of years. So first of all, I'd like to say that although MIT has not fulfilled that hope and promise that we all thought it would and we still believe it could, its record in many ways is still better than some of those other institutions. So what I say is, "If not MIT, where?"

There may be other institutions that have done a better job with faculty. Take Harvard University, for example, just up the road. One can right off the bat think of the names of very distinguished African-American scholars who have come into the various programs of that institution, whether you're speaking of law, African-American studies, or other areas. I'm not sure if its overall numbers are as high as that institution would like, or as we think it should be, or whether propor-

tionally it has more than MIT, but at least one can think of very notable African-Americans who have come into distinguished positions there at Harvard. Part of what they've done there—and this gets to the advice issue that we talked about a lot at MIT and other institutions—is that in order to be successful in recruiting and maintaining African-Americans, it seems as if a critical mass is needed, so that people have a sense, within the larger community, of an African-American community with sufficient numbers. People can thrive and work as they wish and as often as they need in both of those communities.

I think the other issue is a need for a permanent, lasting commitment at the very top of the university by the trustees, the president, the chairman of the Corporation, and all of the deans. Deans and department chairs are the ones who very much set the policy statements and the spirit of what's going to happen in the day-to-day functioning of those academic units. Just as we talked before about how much of a concerted effort there was to begin recruiting African-Americans, first undergraduate students and then graduate students, that same effort, I think—and I want to be fair on this—was not done as well with faculty. Some of it is a structural issue. You can have centralized recruiting of undergraduate students, you can have basically one office for undergraduate admissions and a financial aid office to support it. At the graduate level, because you've done this, you know you can do some recruiting, but at that level you also have to have the unit—the faculty in the academic unit—play equal parts in it. By the time you reach the faculty, you can do a little bit of recruiting centrally—not a great deal—but almost all of it goes back to focus on the deans, the department chairs, and distinguished section leaders. That's where I think the priorities have just simply not been steady for recruiting and for sustaining African-Americans.

Let me just come to one part of this. The one area where that perhaps could have been done was in developing and nourishing MIT's own graduate students as they moved up through the ranks. And similarly, perhaps, in some of the administrative levels. I think only recently Ike Colbert was appointed to the Academic Council as dean of graduate students. He's a member of that group. I don't know if at this time there are any other African-Americans on that Academic Council.

Yes, Phillip Clay as associate provost.

Those are two and that, as you know, has been a long time in the making. We're glad it's there and, after some twenty or almost thirty years now—thirty-one years, I believe, since a group of African-American students went to the administration following the death of Dr. Martin Luther King and said, "Let's make some changes here," and the administration responded positively to that—we're just at this stage reaching that point. I don't know how many African-Americans over the last two or three decades we've had as departmental chairpersons.

One—Phillip Clay.

Good! Phillip Clay again. So Phillip is in some ways setting a standard. He's one of the Institute's own graduates and that's quite good, but they need more of those. Other institutions have been successful, and MIT has too, in recruiting people it wanted from all parts of the world. There are distinguished African-Americans in numerous positions in all parts of the world, and one would hope that the Institute would have recruited those or would have grown and developed some of its own. And that, unfortunately, has not happened as well as it should.

The really sad part about it is that there ought to be sequels to your book. There ought to be some different chapters about the large numbers of African-Americans who will come into the place, either as students or as recruits from elsewhere in different parts, and will be in the leading spots, in influential places in the institution. Let's hope that that can still be possible. It will probably be the generation behind us. They will have to push a lot more to enable that to happen.

What advice might you offer to other black students, faculty members, or administrators who would be coming to a place like MIT?

The most obvious thing is that matters have changed in our country a lot since I first came to MIT as a student. Many African-Americans now attend high schools along with whites, and they have whites in their classes. I was coming to MIT from undergraduate and high school experiences in which all of my fellow students were African-American. At MIT very few were African-American and there were a lot more international students. That is one difference—one change, in fact—that many African-Americans would not

have experienced. On the other hand, so many of our high schools in this country are almost entirely African-American, so that students coming from those institutions are facing some of the same problems I had when I left LeMoyne College and, for a few years prior to that, Booker T. Washington High and coming north to an essentially all-white institution. That transition is still, I think, important for many people.

The second thing—and this, I think, pertains to us regardless of our race or our ethnicity—is that for nearly everyone who comes to MIT as a student, the place is a step higher and in many instances a large step or quantum leap or two or three steps above where one was before. That’s “above it all” in terms of the challenges, the demands, the skills, discipline, and hard work that are needed to succeed. But MIT is also a very competitive place where folks compete a lot. That’s the nature of science. Everyone wants to be successful at the place and many people want to be ahead. When I talk to students there, I realize how much of a drive folks have to be on top. Given that you have to be generally on top or nearly on top in order to get into MIT, you need to make an adjustment and say, “Hey, I’m not always going to be at the top. Being at this place, being average at MIT, still puts one in a pretty unique pool of folks.” The adjustment to that climate, the environment, is a very difficult one.

I remember quite well that once I took a vacation from MIT and went to California. One of the former MIT students I visited there was Nate Seely, who had done his undergraduate work in electrical engineering at MIT and then had moved to Stanford. I spent about an hour or maybe two hours with him on the campus. We talked and I think we had lunch together. He made a comparison between his life at MIT and his life at Stanford. I can remember this conversation quite well. He said he didn’t seem to work as hard at Stanford as he did at MIT, but he still got as much done and he was learning as much. He said he had time to go bicycling with his girlfriend, the kinds of things that at MIT he didn’t feel he had time to do.

So it’s that climate, that hard-working, being forever busy climate of MIT that’s not, I think, at some other very distinguished and highly successful institutions, Stanford being one of them. So when you come to MIT, I think, you have to be

prepared as a student or as a professor to work in that kind of almost grinding environment. I’m not saying that’s the way it should be. I think there needs to be time for more relaxation, a lot more reflection, a lot more introspection as opposed to production, at the place. So I think that is one element of advice that’s to be heeded.

Also, I came from a richly supportive African-American environment. For those African-Americans who come to MIT having been in an almost entirely white environment, they need some way to get away from MIT on a full-time basis and go to a historically black environment, where there’s a historically black or predominantly black college or neighborhood or work environment. I think it will increase their personal perspective on themselves, on America, and the rest of the people with whom they have to live and work, including African-Americans as well as whites. That can be very difficult to do at a place that has pretty well laid out a schedule of how you function as an undergraduate, as a graduate student, as a professor, and as an administrator. But somewhere, before one is too far along in his or her years or career development, my strongest advice—no matter how successful they have been or even how much they love what MIT is offering—is for our younger fellow African-Americans to take a leave from that special white world and come home again, or come home for the first time if they’ve not been there before. I would hope that, with that kind of a leave that MIT students can certainly take when they wish to take it, more students will be encouraged to do that.

I would hope students would be encouraged to realize that they’re going to get jobs in this day and age. That has generally not been a problem, I think, for quite a few years for MIT graduates. I’m not sure in any recent years that that has been a problem, even the last thirty years, at all for African-American graduates of MIT. It would be interesting to see what kind of employment difficulties, if any, African-American graduates of MIT have. I would be inclined to think not many. As I’ve met alumni, I don’t recall talking to many who were unemployed. They may not have achieved the exact jobs they wished in the areas they wished, but they all seem, once they’ve finished the place, to have been fairly successful in their life. Is that generally the pattern?

Virtually everybody I interviewed has been extremely successful.

That doesn't surprise me at all. That speaks well of the people who came as well as what they accomplished at MIT. But that break, that break from that white world of "MIT Lite" to a historically black institution, I think would be extremely helpful for people to take.

Other advice for them is to do something which we didn't have at MIT at the time, that we have now and that others created prior to our getting there, and that is to get linked up with the African-American community at MIT and in the surrounding communities. People can do that in a variety of ways. Some join fraternities and sororities, some join groups, some work in neighborhoods, some participate in churches, some get into theatrical, musical, or volunteer groups. But I think some connection would help. I think when I first came to MIT, my primary concerns were trying to succeed academically. Nothing else seemed to have been entering my mind. As I look back on it now, I wish the few of us who were around there had really built and strengthened those linkages earlier. But those resources are there now.

Other resources present now that weren't there at that time were ones that you and I participated in and you and I created. There now is a bank of African-American administrators and faculty and staff to which students, faculty, and staff can also link. One would hope that there would be more partnerships and more mentorships, more friendships, and more relationships—whether they're very intense or occasional—so that at least people will know about those, tap into those, and make the greatest use of them for survivability. All groups have their codes and their secrets and their patterns. They have their ways of passing on information and advice for survivability and for thriving to new members and to younger members. The African-American community, the black community at MIT, I think, has that resource and needs to share it more and more.

The other bit of advice, and this is a harder one for people to accept, is that they should realize that in some ways they represent the black community, but in other ways they are not carrying the full black community on their heads and shoulders. If they fail in some activities, and this we are all apt to do, it's an individual shortcoming—it is not a blow against the whole race and the whole

institution. Those of us of our age worried about that an enormous amount in those days when the numbers of us were so small at MIT and elsewhere. I'm hoping that that is less of an issue, less of a demand, less of a bad dream, less of an oppressive force on today's African-American students, faculty, and staff than it was so much on us, both consciously and unconsciously.

That's a very hard one, I think, to deal with. It's not something you say, "I'm going to go out and take this step." It requires some sort of intrinsic, internal adjustments. One way of that happening, though you can't do it always, is to try to recognize and try to get into places where one is not the only African-American. It gets back to that critical mass again. Sometimes the critical mass may be two in a room as opposed to one. I'm almost certain that most days in which you go to meetings, and the same is true for me, I can expect that most of the people—if not all of the people in the room except myself—would not be African-American. Unless it's a meeting dealing with issues of African-Americans, getting more than two or three in most of the meetings we go to just doesn't generally happen. You find yourself often alone.

I think one of the burdens, potentially, you have to carry when you're the only African-American in a room is that the whites expect you to speak for all African-Americans. Yet we don't, we can't. A faculty member at Amherst College—Dr. Andrea Rushing, I recall—made a wonderful point to young students. She was trained as an anthropologist and had grown up, I think, in the New York area. She said to people, "If folks ask you to represent the black community, tell about the black culture and all that, remind them that you're a student and you're not an anthropologist." She said she didn't know about her own community and many other communities until she had really studied those issues. It's an enormous burden for a youngster to get placed upon him to explain, to justify, and to describe all about the African-American culture. People need to be able to say, "Look, we are many people and here is my view. I speak for myself. In some ways I may be able to share views of the larger group, but not in others."

I guess the last bit of advice is on that point, that we as African-Americans have to realize that we have our different views and we can share our different views both with each other and in other climates. That becomes far more difficult to do

when the weight of decisions seems so important. Say we're speaking, for example, about what may be the best way of recruiting African-American faculty members. If you have one view and I have one view, the best way for us to look at that is that we've got two potentially good views out, not necessarily two competing views. One may be better than the other one, or they may be equally good depending on which one might fit the circumstances at that time. But we're often looking for kind of a unitary position for the African-American community to support. I think there's less of that now, and whenever there are more people, that certainly becomes less of an issue.

Talk about any topic or issue that comes to mind that reflects on your own experience and on the experience of other blacks at MIT and other institutions you have been a part of, that you think may help the next generation of people who have this same kind of issue to deal with.

Let me cover three areas. I want to talk about people—the people I admire, the people who had an impact upon me—and use that to encourage people very much to really reach out to others. When I first came to MIT, I think they had only one black faculty member, a fellow who was teaching German. I took that course my first year for passing my language examinations for the doctoral program. There were no African-American faculty members whatsoever in science. Yet I learned an awful lot from many of the white faculty members who were there. There were folks who are still alive now and some who have passed whom I greatly admired, and they had several features that I wanted to emulate as a scientist and as a science teacher.

I can remember Dr. Charles Coryell, who died around the time I was a graduate student from a raging cancer in many parts of his body. It probably came from his work on the Manhattan Project with a lot of radioactive materials. He was not only a distinguished leader in his field internationally, he was one of those faculty members who was enormously respected and loved. People enjoyed being around him. Charles Coryell had that quality about him.

There were some folks whose classes I took in physical chemistry—Isadore Amdur, who I think has also passed at this stage, and others who in their informal interactions with me when they bumped into me in a lab, or in the machine shop

when I was working on something, would just strike up a conversation, one, to get to know me, but also to give practical advice about the device and whatever else with which I was working. I had seen them in lecture classes being extremely well prepared. I had been in a recitation section with Isadore Amdur with about thirty students, and noticed how he asked questions and encouraged people. Those, as well as Frank A. Cotton in inorganic chemistry, who was an advisor of mine, all set a stage of professional competency in their field. And I said, "Boy, that's great." I really wanted to look at people at the top and come as close to that as I could.

So I think one of the things for young people to do is to try and find the very best folks around MIT, and there are many of them—learn from them, learn their qualities, get to know them, see how they are successful in their fields, ask them to be advisors and resources, get tips on big things and small things, and, in brief, just make the most of the place by reaching out to them. But as a young graduate student, I have to tell you I found that very, very hard to do. I was shy and intimidated. When I returned to grad school, after having worked in government for a while and taught for one year, I was much more secure, I think, in myself and in my abilities. Where I was not as secure about them, I think I felt I could still ask for help. So I think one needs to really reach out to folks, be able to raise a hand and say, "Assist me, help me, give me a hand, do something for me at this point," and not be embarrassed about it.

That's hard, particularly for MIT folks. All of us who have come there work so independently at times that it's hard to join with someone else because it may make us feel dependent as opposed to independent. People helped in that regard. I can go through a wide range of people there.

As I was finishing my graduate work, when I came back after one stop into teaching and another time to work in government, I had a sense of what I really wanted to do. First, I wanted a research project that was very likely at that point to be concluded in a particular number of years. I selected a project with Alan Davison. I got to know him and something about his work. He's a man I got to know enormously. I think he balanced well his personal life, his professional life, his teaching life, and his research life. These days he has been working on the thing that I guess all of us

often want to do in science—some work that has had a very practical usage in the everyday world of the health sciences.

Almost ten years ago now, I had to go to the hospital and take a test, a stress test. I had passed out and the doctors eventually found out it was a relatively minor problem, but we went through and did a lot of exercises and tests. At one point this physician injected a particular substance in me to see how my blood was circulating and to monitor some aspects of my heart. I was curious about the test and the background of it. He said, “I’ll give you a reference on it.” I was delighted to see that the reference on it was connected with work that Alan Davison had done. These were inorganic chemicals that now have this profound health benefit, and I was even a personal beneficiary of that. So that’s the sort of people I saw at MIT. I can go through a lot of them in the faculty.

The next group really had to do with administrators. When I first came there, there were just a few of us—a very small handful of black administrators. There was John Mims. John had been hired maybe in December of ’68 or very early in ’69 to recruit African-American students. I think it had been one of the commitments that the institution had made to the black students’ demands. I think they had a set of about ten or fifteen demands, I don’t remember the exact number of them. One really called for some full-time administrators to work on matters. John was hired to work on the admissions part.

I can remember the first time I saw John. It was not really even connected with any work at all. I was going through the “infinite corridor” down there, near where the office was. People sort of pass each other rapidly there. I must have been going over to the Coop or something, that end of the campus. I can just remember seeing him, a distinctive face, walking down the hall very thoughtful, almost stressed—a new face, because I hadn’t seen it much. We didn’t interact at that time at all. I just noted it. Then later I met John because the administration was very much seeking to hire another African-American, this time to work in the student affairs office doing two things. One was coordinating Project Interphase, a summer transitional program for African-American and other students, and the second was to provide some academic and perhaps personal connections with the African-American students.

I got a call one day from Dr. John Irvine, who was, I think, the executive director or executive chairperson—I’m not sure of his exact title then—of the chemistry department. He was another chemistry faculty member who had been on my examinations. I knew him well in that regard. When he was serving as the executive officer of the chemistry department, he worked on assistantships and things like that, so I got to know him well. We were not personally very close, but I just sort of knew him. He gave me a call one day and said the dean wanted to talk to me. I didn’t know who the dean of student affairs was at MIT. I knew about the dean from my undergraduate days at LeMoyné: You’d say, “My goodness, what is the dean calling me for? What have I done? What kind of trouble have I gotten into?” But in any event, he said he wanted to talk to me.

At that time, I was finishing up my Ph.D. successfully and was really trying to think about what I wanted to do. Having done some work in government and having taught, I wanted a mixture. I was thinking of going out West, I was thinking of moving down South, but I had come to really love the greater Boston area for many reasons. I enjoyed skiing, enjoyed the seacoast, enjoyed the city of Boston, and enjoyed the climate—a lot more temperate in some ways than the very hot weather which you and I grew up in down South.

So in brief, I got this invitation to go down and speak with Ken Wadleigh. Ken was a very direct guy. His training was in mechanical engineering. He asked a few questions and got immediately to the point of what he wanted. He wanted me to come in and work on this program. The interesting thing about it—this was in ’69—was that a small group of African-American students, undergraduates and graduate students, had visited the administration and made these demands. I wasn’t part of this group. I knew very little about them. They may have been written up in *Tech Talk*, but I frankly don’t remember. But there certainly were not running through the chemistry department a lot of discussions about the demands. They were not mentioned in the ranks of inorganic chemistry. I probably saw very, very little of issues in my daily work as a chemistry student.

At that time, I was active in the civil rights movement in the community, but on the campus issues I had not spent much time dealing with

those at all. So Dean Wadleigh, in part, was bringing me up to date on things other African-American MIT students had done. The very first part of it was, here I was being offered a job growing out of insistent requests—demands, really—of African-American students also on campus with whom I had very little contact. I don't know if Jim Mayo was in that group or not. They were a younger group of students. At that time, I was living off-campus in an apartment. I did my chemistry work and did some volunteer work for the Congress of Racial Equality, but not much on campus beyond that.

So I learned a little bit about the job, and it seemed interesting. The part of it that seemed most interesting to me is that it would give me a chance, if I accepted it, to work in the administration and to continue some work in chemistry as a postdoctoral student. So between John Irvine's efforts and Ken Wadleigh's efforts, a job offer was put together and I accepted it. It was only right after accepting that job and saying, "Now, how does one carry it out, who are the people involved in it?" that I got to meet John Mims. I asked Wadleigh who were the people involved and he listed Mims. Mims and I met and talked. We had to figure out what were we working on and doing here. One of our first chores was to be involved in admitting the next crop—in fact, one of the largest crops—of African-American students. I think John and others had made many decisions. I had a chance to look at some students in connection with Interphase, as it was coming together.

It was through that, then—as I said, I wanted to meet with some of the students—that I got to meet Shirley Jackson and Jim Turner, who I think were the key leaders of that group at that time, and a young freshman, Fred Johnson, from Texas. I think he came in in '68 as part of a very small group, maybe ten to twenty African-American students. I got to meet that group. They didn't know me and I didn't know most of them. I think over the years we had to develop a working relationship. Part of it is, what do people expect of black administrators and what do black students expect of black administrators? This is an issue that comes to all African-American administrators. You've got to say, "What do people want of you? Whom are you serving? Which way do you serve your community, your own needs, and your institution's needs?"

Anyway, it was through the preparation by directing Interphase that I slowly got to meet this collection of people. Some faculty I knew very much from the chemistry department, but there was a whole new set of faculty and administrators around the institution about whom I knew very little. There was a larger group—still not huge numbers, but certainly a larger group—of African-American students, all of whom were pretty much active. So I got to meet Ken Wadleigh and Paul Gray, who I think might have been assistant dean for student affairs, and shortly after that I think he became the associate dean. Paul ran the freshman advisory program at the time. Alice Seelinger was in that group. Slowly, I met more people in the Medical Department and a group of folks in financial aid.

Financial aid was the one administrative office with which I had had some contact. When I stopped graduate school at one point, I was working for the state government and they didn't take money out of my check. When I came back to MIT, having dropped out of graduate school twice, I did not get an assistantship. They wanted to be sure I was going to stay for a while, so I had to use some of the money I had saved to pay for my tuition and not pay the federal government for taxes. At some point, the federal government came knocking—not quite literally, that would have occurred next, but they at least sent a letter. I got worried about what I would do about it. Then I found out how easy it was to get a loan from the institution. I only had to sign a card. I think it was \$1,400 that I owed the federal government, and I paid it back over the year. That was one of those ways of saying, "Wow, this is a resourceful place—it's a place where help is available if you reach it early enough." And it was a place in which the white folks even provided that level of help.

So I met John Mims and then shortly after that, maybe later the next year, I think, Benjamin Franklin Moultrie came into the Financial Aid office. It wouldn't have been too many more months after that that you came into the Graduate School office. Do you remember what year that was?

That was 1972.

So three years later. We didn't have anyone full-time, I guess, in the Graduate School office. They began hiring a number of other people. Don

Palmer was hired in the Medical Department as a psychiatrist. Then they started bringing back to the institution folks to be either hired or brought in as visiting faculty. James Young in physics, a very distinguished fellow, came back. Myra Rodrigues was then hired, I think, in the social work department. So around '72 or '73, we began to have, not large numbers but at least a core, of black administrators and professionals in different areas who could work with each other, talk with each other, and to whom students could come for support. So we really, for the first time, started to have a stronger mixture of people. Nanette Smith came somewhere in the early '70s as well. That was our first time of really having two black administrators in that office.

That was a wonderful beginning. I remember quite well, as people were speaking of a man on the moon for the first time, that Shirley Jackson and I were watching part of that blurry TV in her room in McCormick—just, I think, at the very end of the first successful Project Interphase. We had seen African-American students come in the summer and we had had an excellent team of teachers—a mixture of African-American graduate students, white graduate students, white faculty members, and I think there might have been one or two black instructors. We were very pleased, I think, with what all the students had done. But there was still the question that we had—how well will the black freshmen do when they reach the first classes, and will they be successful in those without the caring support that they had in Project Interphase? And indeed, most of them did do quite well.

It was that set of relationships that I think were often important to me. I spoke to you about how I admired some of the people in chemistry for what they had done, but I had learned from others. I had learned a great deal from Ken Wadleigh and his style of interacting and leading, as well as from Paul Gray, who was only in the dean of students office a short while—I think he then became dean of engineering.

But there was also one group that pulled students, faculty, and administrators together on how, in essence, to fulfill those several points of the demands of the African-American students. That was the Task Force on Educational Opportunity. One of my jobs was to try to keep track of those actions and keep notes of the group. I thought that

Task Force was an excellent team approach. I don't know who set the group up as kind of a high-level organization for administering things, but on it in those days were Jerry Wiesner, who I think was provost at the time, Al Hill from the physics department, Ken Wadleigh, Paul Gray, and other faculty members. The faculty numbers changed a little bit. And there were representatives from the Black Students Union, and they varied from graduate students to undergraduate students. We had a strong mixture there.

I think that group wrestled with some very, very tough decisions—on admission standards, on classes, what type of support should be in offices. One decision it made, that had an impact that I'm not sure people realize, is that these programs were initially set up for African-American students, for blacks at the time. Project Interphase and those other groups were not targeted for Puerto Ricans, Hispanic Americans, and Native Americans. At one point the issue came up of who would be admitted to Project Interphase. Because the opportunity presented itself—and I think there were other factors—a decision was made to include in Interphase some white students whose academic talents were good, like the black students who had been admitted to Project Interphase, but whose educational experiences had been poor, like those of the black students coming to Project Interphase. That decision made by the group—I don't know who first recommended it—I think had far more impact than many people realized.

Let me give you what I think, as I look back, the positive psychological feature was. I think it showed to the black students in Project Interphase that there were other students—white students—who were having the same problems that black students were having. I'm sure it showed the same thing to those white students. They didn't realize black students would be this bright—it was their first experience as well. I'm not sure the students stayed together as friends for a long period of time, but anyway, that decision was made.

Somewhere in the first or second year, this Task Force also made the decision to expand the recruitment as well as the financial aid package for African-Americans to include Hispanic Americans, Puerto Ricans, and Native Americans. So as you look now at that issue we talked about earlier, about how the minority community has grown, I don't think people realize that it was a

group focusing exclusively in its earliest stage on African-American students that brought about the changes. More importantly, it was what that small core group of students did following the death of Dr. Martin Luther King, Jr., that brought about the educational opportunity that so many other minorities are now experiencing at MIT.

I don't know if they know it, I don't know if they appreciate it. I wish they would, because they'd be pushing more to try to keep the African-American numbers up. I have a feeling that many of the students who were part of that group may be modest about their own accomplishments and the breadth of what they had changed at MIT and in a nation as a result of responding positively to the tragic assassination of our leader, Dr. Martin Luther King, Jr.

That group also had its funny moments. There were some pretty militant students in the group. The Faculty Club had an annual event that had a theme for it. The theme for that year—I think this might have been 1970—was something like “A Wild West Show.” Progress on some of those original demands had not been going as well. I can't remember the details of what it was at this time, but the students decided they were going to attend that event—I think it was on a Saturday night—at the Faculty Club. The whites were dressed up in some costumes playing “Wild West” and a group of black students came in. I wasn't there. I don't think they disrupted in any way or destroyed anything, but their very presence certainly changed the atmosphere around here. This would have been the first kind of direct action or sit-in. It would be interesting to see what really happened at the time, what students remember happened at the time. But by that weekend, it set action throughout the place.

Now, there were three or four of us in the black administrative community who had heard that it was happening. I think we learned about it just as it was happening; I don't think we knew about it beforehand. One of the things we figured was that people were going to call us and say, “What do you want to do with these black students over here?” We purposely got together and made ourselves unavailable. We said, “This is a decision that the white people have got to decide on for themselves. If they haven't acted enough, they've got to figure how they're going to respond to it.”

There were no arrests, which we didn't think was going to take place, but by the very next day or so action started to really happen. This brought me into direct experience with another MIT leader whom I greatly admire for many reasons, but also for the way he handled that. That was Howard Johnson, who was president at the time. I wish I could remember his exact words, I wish I had kept a diary about it at the time. His was not an overreaction. In fact, his reaction was not to the incident. He wanted to know what was the cause and what else should we do. It was a kind of candid admission that we hadn't done enough. That's what he sort of charged the group with doing, taking the next steps. That's an indication, I think, of the quality of leadership at MIT from whites at that time—the Ken Wadleighs, the Paul Grays, the Howard Johnsons, and the Jerry Wiesners—that kept things going quite well over long periods of time.

The group had its difficulties and its ins and outs. Some of the meetings were enormously tense. These meetings were usually dinner meetings in the Student Center or some place. I recall at one of them that the students had been very displeased with the amount of progress the place was making, and they decided they weren't going to eat. Everyone else had planned a meal and many of us sat there and ate. But it was very tense when you had one group of people eating and another group of folks glowering at you. So the group conducted some kind of business, I don't know what all happened at the time, and then most left. Then the funny part of it, if you ever just ask some of the students if they remember this, was how quickly the black students then went for the left-over rolls and everything else that was on the buffet table in the back. We all laughed about those aspects of it.

There also were other human moments, to show you how things worked. I'm trying to say all this in a way that's positive, not gossip. People have their insights and they have their emotions, and I hope they can also these days look upon it with a little bit of humor. But racial issues sometimes make it very hard for folks. One of the young men I mentioned to you was Fred Johnson, who came up, I think, from Texas. His freshman advisor, I think, was the late Jerome Wiesner, a man of enormous scientific talent, political accomplishments, liberal leanings, and I think of great compassion toward the African-American movement. A good

deal should be attributed to what he did at the time. He was Fred's advisor and spent a lot of time with Fred. I think Fred had been on Dr. Wiesner's plane, things of that nature.

Well, at this meeting, some incidents occurred and Dr. Wiesner was angry about things that were taking place around him. He claimed that Shirley Jackson had done some of this, and in that case she had not. It was Fred who was charging Dr. Wiesner—not necessarily personally, but the full white leadership—with not fulfilling promises. I think Dr. Wiesner had a hard time believing that somebody that close to him could accuse him of not fulfilling a promise. So finally he turned, if my memory is correct on it, and said, "Shirley Jackson, I know you didn't do it—you put somebody else up to do it on your behalf."

Later Shirley, Fred, and Dr. Wiesner worked together, but it was an indication of the personal interactions which were often very difficult within that group. I've never seen Dr. Wiesner become quite that irrational. He had always shown emotions—good emotions—but that was one in which I said, "This guy is really off-base. He can't quite deal with what's going on here with the young freshmen and sophomores." It's not unusual for youngsters to say their mind in a way that's not that good.

In some ways it was funny, but in other parts it showed how it went. Shirley remained very calm, cool, collected, and on the point of reminding him that she was not the one who had done it—that it was someone else. You could see this enormous talent in her and you could see this growth in a large range of the students who were there. All that came to increase my admiration for Shirley, Jim Turner, Fred Johnson, and the range of students who took leadership positions in the group, including Linda Sharpe.

I remember Jim Banks, who is now in the telecommunications business. I met him at the twenty-fifth celebration of Project Interphase, and I remember how much he had changed. I think he's from Florida. James is perhaps class of '76 or '77 in Course VI.

He's a vice president of one of the major companies, I think.

Yes, that's the fellow. He was always a quiet guy, great sense of humor. I don't know if Fred finished MIT. I think he left after a while. I thought many

of the students kept in touch with Shirley, particularly some of the leaders who were there at the time.

We were talking about other people who came back. There was Ron Mickens, the physicist. There was a group of people who may not have been involved officially in the meetings, but who also took part in some of the strategy sessions and some of the reflections. So in many ways, it was a very sizable portion of the black community that made contributions to the various things that took place there.

I'm trying to think of one other funny incident that we had, another incident in terms of how people respond to language. There was a very tough guy by the name of Larry Dean, who came up, I think, from the Philadelphia area. People said that Larry had been with Father Groppe, who, I think, was a priest who worked with a lot of young kids in the Philadelphia area where Larry came from. Larry was a tough guy who had a mouth full of pretty strong words. He was elected to come to one of these Task Force meetings and he encountered there another guy who was pretty tough. Paul Gray did a lot of working out. I'm not sure if he's still doing that, but he was pretty hefty and barrel-chested, as I remember at the time. At one of these meetings the words got strong, the temperature got hot, the language went back and forth, and this guy called Paul an "SOB."

That was the wrong thing to say. I don't think Paul had been called that in a long, long time. So I think he had a moment of adjustment to make. He didn't overreact to it. But I think, like Fred Johnson's comment about Jerry Wiesner, it made people look at some other issues about self and race and relationships that they had probably not expected. I would hope that this amounted to a growing experience for administrators at the high levels of the university, as well as it did for students and those of us who were in the early stages of our careers at that time.

For some in the meeting, it was funny. But it was sad and obscene too, not the kind of thing you really hope to see emulated. That's not what you encourage, not a method with which you encourage African-Americans to negotiate or to talk, but it certainly brought out a different group climate. When you bring folks into your institution, there are some changes that have to occur, maybe even in the way in which language takes place. I think

Larry did some work at Northeastern and someone else told me later he came back to MIT as a master's student or something else.

I talked earlier about relationships between black administrators and black students, and the expectations. One would like to believe that that's an issue solely between African-American students and African-American administrators. But it isn't, which you know so well. Many other people contribute to it.

At one point there was a student, one of our African-American student leaders, who had a leading role in the Black Students Union and who got into some academic difficulty, which is not uncommon at MIT. He had gotten an "incomplete" in a class. He hadn't done all the work in the class, that's probably the best way of putting it, and he had been on probation or warning for one or two semesters before that. If his grades had gotten below some standard, he was going to be asked to leave MIT with the opportunity to apply to come back at a certain time after a semester or so.

He was taking this class—I think it was in engineering, but I'm not absolutely sure of it. I know it was either engineering or math or science. It was not a social sciences or humanities class. The faculty member called me. I was in the dean of students office and the faculty member told me about what had happened in this class. Then he asked me what grade should he give the student. He used the nickname of this young man. I tensed, because I knew I was trapped. First of all, a faculty member shouldn't be asking me what grade to give a student. That's the faculty member's choice. I had been through it enough to be a little bit prepared for it, so I picked up on my desk a grade sheet, a book of regulations, that talked about an "incomplete," what grade should be given for an "incomplete." The regulations at the time were quite clear, that the student should have done the majority of the work on a passing basis in order to receive an "incomplete." If a student had done less than that, they were supposed to get an F or whatever appropriate grade was coming. I mentioned that to the faculty member. He sort of thanked me and that was the end of that conversation.

Later, the Committee on Academic Performance saw the student's grades, acted, and the student was indeed invited to leave the campus for a semester. I think the professor had given him a D

or an F I don't know what it was, but it was certainly not a grade that allowed the student to stay in good standing. The professor didn't give him the "incomplete."

I didn't think too much about it. The student then applied to come back to the institution, having either worked or taken classes elsewhere successfully, and was readmitted to MIT. When he left, he and I had an appropriate working relationship—a good relationship—and I used to see him sometimes and talk to him about his academic work and his political work. But upon returning, he was very cold toward me. Something had happened and I didn't know what it was.

By this time, Nanette Smith had joined the administration. I mentioned it to her and she said, "Yes, he's upset with you because of what you did about his grade, what the professor wrote about the grade." I said, "What do you mean, what the professor wrote about the grade?" So I called up the professor and asked him if he would send me a copy of the letter. He had kept his letters, as accomplished professors do, and he sent me a copy of the letter. And I was shocked at what it said. It was addressed to the student. I think I've got the words pretty good in my mind. I've been repeating them many, many times because it was such a poignant event. The letter said, "After consulting with Dean Bishop, I've decided to give you a grade of . . ."

That statement is factually correct. He did call me and he did consult with me, but the student's interpretation was that I made the decision on what the grade should be and I was the one who caused him to be out of the institution. Had I told that faculty member to give him a passing grade or an "incomplete," I don't know if the faculty member would have done it or not. That I can't be sure of. But I do know that what the faculty member did in giving what the student perceived as a negative grade was to pull me into his decision-making in a way that had a very adverse effect on the relationship between me and the student.

Those kinds of no-win situations occur often for both black students and black administrators. The black administrator I was at that time was certainly in a bind. What I would do regularly with faculty members is say, "Here's the situation. Here's the Institute's regulation. Where is the student? What do you want to do about it?" And the

faculty member decides himself what grade to give. But the students expect that no matter what, we as administrators would bail them out and save them. The truth is, though I don't know for certain, that for most undergraduate students—even graduate students—taking that break in their academic work and saying, “Hey, I'm not doing enough on my academic work here, I failed, and I've got to come back and do some things differently” will be a positive event. But most of them don't see it at the time. I don't think I would have seen it myself if I was that student.

So the biggest loss was not to the faculty member, it was really to the student and to me. We lost our relationship with each other. The good part about it was that there was an alternative. There was another black administrator in the office. So the student, if he didn't want to come to me but still wanted to go to someone black, could go to someone else. It's another indication of why that critical mass, even if it's just a choice of one other person, is very important for successes in these areas.

We talked about how the senior administrators dealt with African-American administrators on their way up. Two of our African-American brothers have reached senior ranks—Ike Colbert, the dean of graduate students, and Phil Clay, the associate provost. Those are really good steps. We've said that over these many years there perhaps should have been others. I think we've had one other African-American woman, the previous dean of student affairs, Shirley McBay, who was in that group. But when we look at how people have progressed around the Institute, the record is not so good. I say this now with some sadness, because since our last interview some of those people have passed. I'm not trying to knock folks who have passed by any means, but I'm trying to give a sense of history and how, at least in my mind and perhaps in other people's minds, things function.

One of the things that seemed to be very clear to me was that white administrators cared for some people, mentored some people, and supported them extremely well—and they moved up the ranks. Howard Johnson was a strong supporter and a mentor of the late Constantine Simonides, whom I liked very much and who also played a role, by the way, on the task force and that group. Jim Culliton was, I think, very strongly supported

by John Wynne. I think John has retired. And I'll give you the name of one other person—Kathryn Lombardi, now Kathryn Willmore, who's secretary of the Corporation and vice president. All the people I've named, I think, are very competent. I like them all, I admire them all, and I'm not saying anything against them. But I'm noting that that's an example in a place like MIT where having a strong mentor is very valuable. The question is, has the institution provided those same honest, caring mentorships to African-Americans over the years?

I can say with gratitude and with pride that during the time I was there, I thought Paul Gray, Ken Wadleigh, John Irvine, the folks in chemistry whom I mentioned, and others mentored me in some ways, and I appreciate their having done that. But there's one element of it—and I'm trying to put this in the most sensitive terms I can, because I hope at some point the people I'm going to mention now would read it as my talking to them directly about it—that there's also a need, in turn, to be very direct, to be very honest, and to be very candid with people whom you are mentoring. And whites have got to know that they've got to be very open with African-Americans. Otherwise, whites can become paternalistic and not treat African-American people with full respect.

That's a long way of getting into another story that affected, in a serious way, my relations with some of those administrators whom I deeply admired and still respect. Two of those are Paul Gray and Carola Eisenberg. I worked with each and enjoyed working with them. They were very supportive of me when I decided I wanted to move up in the ranks and try my hand at being head of a student affairs office somewhere. They supported me and they wrote strong letters of recommendation for the places to which I applied. I think that as a result of that, I was able to be the dean of students at Amherst College, a job I love very much. I met my wife when I was at Amherst—another reason, as you can see, why I deeply love that connection and probably wouldn't change it now.

But at the time, I think Dean Eisenberg had been in her position at MIT for several years. None of us thought she would be leaving it. There were, I think, three associate deans—three or four—who left around that time, within a short period of time.

There was Ken Browning, who went out West; Pete Buttner, who has since passed; myself; and, a few years before that, Dick Sorenson. All of us were ambitious guys who wanted to move up and try our hand, and we thought there wasn't going to be a position at all in that post at MIT.

Shortly after I took the position at Amherst College and went out and got started in it, I received a notice and some phone calls saying that Dean Eisenberg had accepted a position at Harvard Medical School—a fine position over there, I think as dean of students. What astounded me, shocked me, disappointed me, and angered me was that neither she nor Paul had given me any clue at the time I was applying and had been offered the position at Amherst College that an opening might have occurred at MIT. What I would have preferred is their saying, “Hey, Jim, an opening is occurring, but I don't think you're ready for it,” or, “An opening has occurred, we're going to have a national search, you may or may not be a successful candidate,” or, “There's no way in the world we'll hire you.” Whatever they were going to say, that would be fine, but at least tell me that that was a possibility, so that I could make in my own way a mature decision about my life.

Paul and I had a conversation about it, and I appreciated that. I think it was very open, very straightforward. It showed me some things. It showed me he was a very caring, competent man who is still wrestling, as we all do, with what you say to people whom you mentor or people you care about or—I'm not sure in this case, because I never had a conversation of this fashion—whether race was an issue in how much he could or could not talk to me about it. Dean Eisenberg and I never had a chance to talk about it. I sent her a very supportive letter about her getting the position at Harvard Medical School, and asked if we could just meet and talk about our new jobs. Part of it, indeed, was my turning to her as a mentor, saying, “How did you succeed in these issues?” Part of it was that I'm sure I wanted to say, “Hey, how come you didn't let me know?” She didn't invite me to talk with her at that point. I subsequently met her as we were both walking across a street in New York City, where I had attended a play. I eventually went over to her house and talked—but not about that, not about that particular issue.

I may never have become the dean of students at MIT, and that's not the issue. I'm very

pleased with where I have been in other jobs. I would have liked the deanship at MIT. Later on, when vacancies came up, people did send a notice to me and ask me if I really wanted to apply, and I made it very clear to them that the job I had already accepted was one I liked, I had made a commitment, and I wanted to stay there. Remember earlier I said that the president, Jerome Wiesner at the time, was having a difficult time dealing with the young sophomore black student and a graduate student, with those personal interactions? Well, here's another case of how an accomplished dean for student affairs with a degree in psychiatry and Paul, who was provost or chancellor at the time, dealt or did not deal with a young black man—myself—with whom they had worked about what my future might or might not be at the place.

It's those small, personal issues that people in all institutions have difficulty with, but I think those of us at MIT have a greater difficulty with. I might not have been as direct as perhaps I should have been with Carola and Paul. In some ways, that's part of this MIT character—we're very busy, we're very active, we can be very accomplished on important, professional, scientific, political issues. But we still have to grasp our dealing with the personal issues. I think you and I have strengthened our relationship over the years. We've had some difficult times, but on the whole we've had good times.

That's one of the other things I want to say in here, that you're part of that same group whom I admire and I thank for what you've done—not just for me, but for the full black community. You're probably the only administrator now who has seen the place almost thirty years straight. In '72, you came in there. Your view would be a really good one—if they're going to have success in those areas where MIT has not had success, with faculty and administrators at top levels—as to what, in addition to the recruitment, the support, the hiring, what personally, what emotional changes may need to occur in the key people for those things to be successful. Part of it would be, I guess, how much openness and caringness can occur.

I'm glad you're doing this. Personally, I just want to know what happened to a lot of people. What are they doing and how do I get in touch with them? I mean, if you had nothing but a list of

where the various people are at this time, that would be helpful. Hearing their reflections of the events that all of us participated in would be a personal joy. But also, I would hope the book can lay a platform, a road map, a guide for how MIT can pick up on the promise it made in the '60s to a small group of African-American students, but really to the Institute itself, and completely fulfill that commitment. MIT can do it. It's a successful place, it's a can-do place. This is an area where it hasn't done it fully, but it still could—for the nation's sake.

THOMAS J. ALLEN

b. 1931, BS 1954 (physics) Upsala College, SM 1963, PhD 1966 (management) MIT; design engineer, Tung Sol Electric Company, 1956; research engineer, Boeing Company, 1956-1965; research associate, MIT, 1963-1966; joined the faculty of the MIT Sloan School of Management in 1966; Howard W. Johnson Professor of Management, Management of Technology Innovation Group, Sloan School; Hunsacker Visiting Professor of Aerospace Systems Architecture and Engineering, Department of Aeronautics and Astronautics, MIT; visiting professor, University College, Dublin, 1998-1999; appointed in 1993 to a ten-year term as MacVicar Faculty Fellow, MIT.

I grew up in Newark, deep in the city. I was not a suburban kid. I went to Catholic schools, to a grammar school near where I lived. I went to a high school right in the center of the city. In fact, the high school I went to was right in the middle of the black neighborhood in Newark.

When I think about the issue of blacks, I think about my father immediately. My father had a lot of black friends. He worked for the WPA back in the 1930s when I was a kid, the WPA being the Works Progress Administration, that job creation scheme of Roosevelt's. He worked with a lot of black people. I can remember black people coming out to the house for a visit. I was talking to my brother about this just recently. He reminded me that my father used to say, "We are all the same under the skin." He must have said that a lot of times because we remembered. When I talk about race relations or anything like that, I think about my dad. That was important. That was a key thing, that he brought us up in that way.

Now, the schools I went to didn't have many black students. There weren't many black kids in the Catholic schools in those days. There are now, but there weren't in those days. There wasn't more than a handful in high school in my time, even though it was right in the middle of the ghetto. It was really right in the middle of the ghetto. The other thing was that the school had such good relationships with the community around them that in 1967, when there were the riots, that school was right in the middle of the riots and not a window was broken—not a thing was touched.

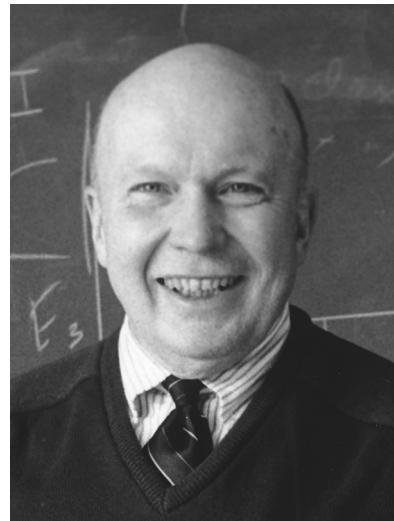

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with Thomas J. Allen in Cambridge, Massachusetts, 11 March 1999.

It was just completely out of respect. If you remember '67 in Newark, it was pretty bad.

It was considered the worst, although there were other similar situations.

Yes. There wasn't a window broken, while buildings around the school were burned right to the ground. Then what happened after that—this is a side issue, nothing to do with me personally—was that a lot of the white folks who were sending their kids in there because it was a good education stopped sending them in. The enrollment went down and they closed the school. It stayed closed for a year, I think, and then a couple of young priests said they were going to reopen it and do it on a different basis, bring in more black kids and maintain at least a fifty-fifty ratio.

They've done that. There was a television thing on it and a newspaper article and a magazine

article written about it. It was a big, big success, and the alumni have raised a lot of money to keep it going. It's an excellent education. These are kids coming out of the projects, kids with a pretty tough background. There is not a single lock on any locker in that school. They brought a bunch of kids up here on a soccer team. I went down and saw the game, and you never saw such gentlemen in all your life. They're local kids. They came in all dressed in jackets and ties. When I was introduced to them, boy, that was quite an experience for me. It was an experience for them too, "Here's this old guy who went to my school."

There were a lot of blacks in the college I went to. I went to Upsala College in East Orange, New Jersey. There was a large black population there, so there were a lot of black kids in the school. But the significant place where I really interacted with blacks was in the service. I met a lot of them there. You really gained respect for people there, when you're dependent on them. That dependence builds up and that in turn builds respect.

There were a couple of people I remember well. One was a guy named Genino Walker, whom I played football with. He was one heck of a guy, a tough football player. He bailed me out many times, he really did. You form a bond and a real friendship that way. Another guy was someone I met when I was working for Boeing out in Seattle. I was playing handball out there in the YMCA. I was on the court one day throwing a ball around and he challenged me to a game. He was a big man. It turns out he was a former all-American lineman from Iowa State. This guy was about forty years old at the time and I was about twenty-five. He seemed like an old man to me. He was one big guy. We started playing and he bumped me. He said, "I like to play rough." We used to have terrific handball games.

I didn't know right away that he was a dermatologist, Homer Harris, with a big practice in Seattle. This was in 1957, and I think most of his patients were white. He was really a great guy, a real gentleman. On the handball court, though, he was anything but a gentleman. Somehow we got very friendly—not on a social basis or anything like that, but because he was older not because he was a different color. We used to meet down at the handball club often. Being a dermatologist, he

even tried to save my hair at one point—I'm bald. That respect and friendship that evolved there was very, very strong.

There were a number of people like that whom I've known over the years. We're just good friends. I have white people who are good friends and black people who are good friends. When I think back on it now that you bring this topic up, there were a couple of people like that who were significant in my life.

How did you happen to come to MIT, and what were your early impressions of MIT?

I was scared to death. Remember now, I was just a kid from Newark. I went to a little dinky commuter school as an undergraduate. The only reason I went there was that it was the only place that would give me an athletic scholarship. I was too small and too slow for any of the big schools.

I majored in physics in college because they didn't have any engineering. When I went to work for Boeing, I was in electrical engineering. Then I thought, "Maybe I'd better learn some electrical engineering." I took a few courses at the University of Washington when I was out there, then Boeing transferred me back to the east coast. I thought I should get a master's degree in electrical engineering. I went first to Northeastern, and then I came over here and talked to people here. My wife—we weren't married then, at the time we were going out together—said, "Oh, my boss went to MIT. You should go to MIT." She talked me into coming over here and applying.

I made a big mistake. I walked in across Killian Court the first day and went in up the steps of Building 10. That's such an impressive entrance way. It's the worst place for someone who has never seen the place to walk in. It just scares the daylights out of you. I went up and I talked to someone in the department, filled in an application, and so forth. They let me in, to my surprise.

I remember the first days in class, when I met all these students with foreign accents and everything. I said, "Gee, I'm in the big leagues now!" That was scary.

What years were those?

That was when I was here as a graduate student, 1959 to 1966.

Do you have any sense of the presence of blacks at that time?

There weren't very many. There were some very good ones in my undergraduate school in East Orange. That's to that school's credit. It was a pretty diverse population there, even in those days.

Move from your graduate student days to the point where you became a professor.

Like a lot of things, it was just more accidents. I went ahead and worked on a master's degree, and I was planning to go back and work for Boeing. I was sitting in a classroom one day with a couple of other students working on some problems on the blackboard. It was a weekend, I think. I saw a brochure there about the School of Industrial Management at MIT. I didn't even know there was any such thing. I said, "Hey, this looks interesting. Maybe I'll go learn something about economics, go down there and take a course." They had a course called "Seminar in R&D Management." As an engineer, I said, "That sounds good." It was the first time it was ever offered. I got to know the professor who taught the course, Donald Marquis. They had just gotten a large grant from NASA to start a major research program in R&D management. I talked to him one day and he said, "Look, you're finishing your degree and going back to work. Why don't you take a year off, a leave of absence, and work for the summer? We'd like to have somebody from industry."

So I went to Boeing, asked for a leave of absence, and they said, "Okay, for one year." Then I got an NSF grant myself during that year to do some more research. By that time, I decided I'd be foolish not to apply for the Ph.D. program. So I did, and then I did a Ph.D. in management. Then they hired me on the faculty. I had no anticipation of that. Me a professor at MIT? Not a chance, not a chance.

What's your assessment of the black presence on campus during your time here as a professor? I'm particularly interested in your viewpoint with regard to your area, management, and in general as far as faculty and administrators. How have you seen that over the years, in terms of the lack or development of the black presence on campus?

There definitely has been an increase; when I go way back, one new black student would have been a marked increase. I've been an advisor to a lot of students, and a lot of them have been black stu-

dents. I can remember the early '70s, I guess it would have been, when there were several students who were really struggling. These were black students who had been admitted and who were really struggling. How much of it was due to the fact that maybe the Admissions Office made some mistakes, and how much of it may have been due to the fact that there was prejudice against them and it was hard for them to perform? It's hard to separate what those causes were. It stands out in my mind because you saw the difficulty much more then than you do now. You don't see black students struggling now like they did then. Partly that's because there are more black students now. Also, I think the white faculty may be getting a little better. It's still a tough fight, but it may be getting a little better, although I hear some viewpoints expressed that make me think things aren't getting better. But hopefully, they are.

I remember a case with someone who had all the ability, but he was having a tough, tough time. He wouldn't study. He just wasn't preparing himself. I gave him a real fatherly lecture. I said, "What I'm going to do now is keep an eye on you. I want you here in this office. I'm going to get you a desk and I want you here every day, so I'll know where you are and whether you're working or not." Well, you couldn't even imagine what that did for this young fellow. I gave him a desk in the inner office with the graduate research assistants. He moved in and, let me tell you, he fixed that office up. He had bookshelves, he had everything. He lived for that office. He was there all the time. He studied hard. He went out and became very successful. He got a job with AT&T. It was a tremendous thing, but all I did was get him a desk.

This was an undergraduate student?

Yes, an undergraduate student. He wasn't a UROP or anything, so officially not on the books to get a desk. But I said, "I want to keep an eye on you, so I'm going to get you a desk and I want you here every day. I want to see your face right here." Man, I tell you, what a difference that made! When I reflect on that, it was just to have somebody who was concerned enough about him to do that. He never said anything. He just worked hard, and I felt tremendous about it. As a teacher, you think back and you say, "I think I've seen some things where I've helped somebody out." That young fellow gave me that feeling.

Have you seen him since he left?

No, I haven't.

What would you say about black faculty in your area?

There have been very few in all the years. There just haven't been many.

What's your view about what accounts for the lack of black faculty in management?

I honestly don't know. I think they have been honest in trying to recruit, I really do. At least I know some people there have been.

You don't have any blacks there now.

I know. There's a cloud of racism that people have to recognize in themselves, I found when I was an associate dean.

I think it's important to say how you see that kind of racism.

Racism is so ingrained in this society that people don't see it in themselves. They don't see it very well. Without even thinking, two people will walk in—one's white, one's black—and they assume the black isn't as capable. Yet they don't know a thing about either one of them, nothing.

When I was associate dean down there, I can remember how you could just see it. When I would bring in a black candidate, they would discount that person right away. They'd say, "He's not going to perform and we can't get rid of him if he doesn't perform." I got so mad, so angry about that. They didn't say that openly, mind you, but you'd have to be pretty dumb not to see it by implication, through the way they behaved and said things and so forth. It was there. Very often it was not overt. It was ingrained in them. They'd just assume right away that the black person is not as capable. They don't even know they're making that assumption, I think. It's just, "We have a) and b), and b) isn't going to do as well as a) would." How much that has affected faculty hiring, I'm not sure. I just don't know enough. But I've seen it so much in the behavior—not in everybody, of course, but in so many people you wouldn't expect it from, people who espouse liberal values. It's deep. These aren't rednecks I'm talking about. These are people who make wonderful talk. They'll talk up a storm. I don't like criticizing people, but it's true.

I can remember one situation that I was very upset about, but I'm happy now because the job was going to be in a particular center where there

were going to be all kinds of problems. I was so happy for her sake. She's a very capable woman and she might have saved it. But it was tough, it was going to be tough.

I value your work in this arena and your relationship with a number of us. You know how you say people who talk the talk don't always walk the walk? You fit the walk-that-walk bill in several ways. When you reflect on the nature of some close relationships that I know you've had with black professionals here on this campus—I'm thinking of one, in particular—what are some of the highlights of your understanding of these things?

It's hard to say. I go back to what my father said years ago, "We're all the same under the skin." That's true. My relationship with black people is the same as with white people—they're people, damn it, people. It's the same way with faculty colleagues. We're colleagues. I don't give a damn what your ancestry might have been. What's that got to do with anything?

You take Wes Harris. There's a great man, I think. He's a heck of a guy. He's really solid, strong, and everything else. He's Wes Harris, not Tom Allen. We're just friends, that's all. I've known Wes for a long time.

That's a part of you, but other people don't always have that.

White folks are very often uncomfortable with black folks, you can see that. You've seen people talking about two nations growing up side by side.

If you had to give advice to a young black administrator or faculty member coming to a place like MIT, what would you say?

Hang in there, because you're going to have a tough time. I've felt it, and it wouldn't have been as much as a black person would. I always thought, "Why am I here? Somebody made a mistake." We all go through that phase. Coming from where I came from, MIT was just such a reach that I thought I didn't stand a prayer of a chance of succeeding as a student, let alone as a faculty member. But I stuck it out. You hang in there and gradually people begin to accept you. It's a good place in the long run, but it's a tough struggle. I think you need to come prepared for that. You've just got to dig in and get rid of that self-doubt. We all have it, so don't figure you're the only one.

What I would say to whites about blacks is, "If they don't understand, we don't understand."

We don't understand how people will react in a situation. What I say in my class is, "How you react to a situation is very much determined by your background and experiences." A young black faculty member coming in will be worried, plagued by self-doubts. He's going to interpret things in different ways. Whites say, "Why did he behave like that?" They interpret it from a white perspective as to why. But I say, "No, no, no. You've got to stop and think. If you were in that situation and you were black, and you saw a lot of white people around here and not many black faces, how would you react to that situation?" They don't even think about that, but it's different.

But I think one of the things about young black professors is that by the time they get to be an age to be a professor, they've seen so many experiences like that that they know how white folks are going to react in different ways. Black folks are misinterpreted because white folks don't understand why they're doing this or why they're doing that. There's a perfectly rational explanation for it, but they don't understand it.

It's a very good point.

I'm not articulating it very well.

It's very clear to me.

If you wanted to improve the relationships between black faculty and white faculty, administrators, and students—and between other folks who are different from each other—what suggestions would you make to the administration?

Just that we're all people and we've got to get more people. We can't keep ourselves separate.

But in order to be able to do that, you've got to have people who are different in the same arena.

Yes, exactly. Whether you can do that administratively or not, I don't know. You've got to get people together. There have to be more blacks here, for one thing, if you're going to improve relations. There are only a few and not enough to make a difference. You've got to get more into the system. Once you get enough of them in the system, you get to know them and that breaks down stereotypes. You say, "This guy a) is not the same as this guy b). They are different people." Suddenly, that opens up people's eyes.

Our departments and schools have their own government. And their own culture.

Their own culture, right. I can't think of a place that fits that bill more precisely than the Sloan School.

Yes. It's different, it has its own culture.

It has its own culture. When you look at the structure, you have a very large administrative category. But you do have a structure there. Then you have a faculty that really has a lot to do with influencing that group, because most of the people up there come from there. In my twenty-seven years here, when I look at that area, they started down a path. They have had some people who happened to be black, for example Phyllis Wallace, who was the only black tenured faculty woman in the Sloan School. But then it changed. There may be one or two still in that group, but they have very little to do with the top—and never have, since I've been here.

Phyllis Wallace was the closest to it.

When you look at it, and that was in the early '80s, I think we were probably better off in that particular school then than we are now.

It's a shame, exactly.

A lot of other places here have done the same thing, not only your school. We know one thing that has to happen if we're going to develop this relationship.

We've got to get some numbers. Even then, we know from experience that that's something that can slip away. People just slip away. The situation will just erode. Even the Martin Luther King fellowships haven't done anything dramatic.

We do need more faculty members like yourself. I know, and have watched, a lot of things that you have done. I watched one particular situation where you really walked the walk and talked the talk: you were the chair of a certain search committee.

And you were on the committee.

I was on it. I learned more about you on that search committee than anything anybody had ever told me before. And then there was what you did after the search committee was finished.

I didn't do much. I just hung around.

You can say that, but I know better.

That's a place where we really needed relationships. He needed to have a good friend who was not black. It was very important. I realized that.

That hasn't been the only case. What we are lacking, in my opinion, is more people like you. There is such a minimal number of people like you who are white.

You make me think of something. Very often I talk with companies about engineers going into a company. I always say, “What you want to do is find an older engineer—pick the right one, though—and you can pair them up in a relationship, as a mentoring thing.” If we can do that with young black faculty in some way, that would be good. I don’t know if old black faculty would be mentors, or old white faculty. The key is to find the right ones and pair them up. Give them an informal role and say, “Here’s this young fellow. Be a friend to him, work with him.” Try to build that friendship and get them to work together in some fashion. Find ways to establish those bonds. But you’ve got to find the right ones, the right pairings to do it. That might be a way to help with the process. There just aren’t enough senior black faculty to do it.

And it seems to me it shouldn’t necessarily be black faculty, even if there were enough of them.

Yes, that’s right. Cross-relationships can really help. That’s what white people should do. Let’s flip it around. Let’s say that I belonged to the other group, that ninety-five percent of the population at MIT was black and I’m a white coming in here. Am I going to bond with the few white people? If I could find one black person who was a real friend, who gave me a connection into that majority community and gave me some advice—someone I could really trust as a friend—I’d feel a heck of a lot more secure.

That’s very well stated. I think most people who have been in a minority position would feel that way.

Is there any other topic or comment that comes to mind as you reflect on your own experience as it possibly relates to the experience of blacks at MIT?

I think about what black faculty and students are facing and I think to myself that it’s a cultural mismatch, much like what I faced. Most of the people I was with when I first came here were out of suburban backgrounds, their parents had gone to college, and all that sort of thing. When I first came in here, that was strange. I think to myself, “Tom, remember how you felt and multiply that maybe ten or maybe a hundred times, and that’s how blacks coming in here must feel. They feel that much worse than you did.” You can understand the problem with the place when you think of it that way.

I can appreciate everything you’ve said, because I know you’re a person who has not only talked the talk but walked the walk as well.

We need diversity. There’s all kinds of people. They come from different subcultures and so forth, but there’s always something that they have to offer.

BENNIE F. L. WARD

b. 1948, SB 1970 (physics) and SB 1970 (mathematics) MIT, MA 1971 and PhD 1973 (physics) Princeton University; research associate, 1973-1975, and visiting scientist, 1978- , Theory Group, Stanford Linear Accelerator Center; assistant professor of physics, Purdue University, 1975-1978; staff engineer, Intel Corp., 1979-1980; research specialist, LMSC Microelectronics Center, 1980-1985; joined the faculty of the University of Tennessee as associate professor of physics in 1986; professor, 1990- ; recipient, Chancellor's Award for Research and Achievement, University of Tennessee, 1998, for his research on quarks and other building blocks of matter.

My family resides in Augusta, Georgia, which is where I grew up and where I went through all of my education before college. I was a member of a large family, the parents of which are Mr. Enoch and Mrs. Irene Ward. I had nine brothers and sisters at various times—James, Charles, Lee Mark, Grace, Irene, Katherine, Enoch Jr., Joanne, and Peggie, in order of age—spread out over a pretty wide range, so that at any one time only a few of them were at home with me. I think they set a very good example, in that we always did very well in anything having to do with academics. I was able to follow pretty much along in their footsteps. My brother Enoch was the valedictorian of his high school class, for example. He's three years my senior. My sisters have made their own marks as well. One of them—Peggie—has attended and graduated from Smith College, for example. I was continuing in this way.

I got interested in going to MIT because I had an opportunity to do something very unusual when I was a senior. Instead of staying in what at that time was the larger all-black high school in Augusta, Georgia—Lucy Laney High School—I decided to take advantage of the new integration opportunity. I integrated the Academy of Richmond County High School (ARC), which was the larger all-white high school. There were two of them in the town and this was the one closest to my house. It was founded in 1783 and, in fact, was one of the best high schools in the state of Georgia. I gave up the opportunity of being valedictorian, because the rule in my city was that you must be in your school at least two years to be

valedictorian. I gave that up for the opportunity to learn more, to take advantage of the new equipment that they had, the more advanced courses that they had, and in fact the better teachers that they had.

I knew this because the previous summer I had been in the Georgia Governor's Honors Program in mathematics. I had met a student, Bill Austin, from that high school who was also there in mathematics. He and I had swapped notes on what kinds of classes were available and what kind of equipment was in the lab. I found out that there was just such a huge difference that if I had any chance to go to ARC, I would be foolish not to.

So I went, and it was quite rough. There were only six black students out of two thousand in the entire high school. Only the twelfth grade was officially integrated. It turns out that a soldier had

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with Bennie F. L. Ward in Knoxville, Tennessee, 10 February 1999.

two kids, in junior and sophomore year. The school was forced to let them in as well, rather than to deal with the government. But the rule was really just for the twelfth grade. So three of my other friends and myself were the four seniors, and then there were two others who were children of the soldier.

We integrated this school, and it was quite an experience. But what I was amazed at was that in the classroom the teachers really were fair. I can say that my grades were just as high as they were in the other school. They never took away anything. In fact, my chemistry teacher had worked on the Manhattan Project here in Knoxville, at Oak Ridge National Laboratory, under Dr. Sienko from Cornell. She was teaching his freshman college chemistry course as the advanced placement course. It would have been impossible in the black school to even get any opportunity to have something like that. I benefited tremendously from that course and from her encouragement. She is really one of the reasons that I applied to MIT, because a student she had had a few years earlier had gone to MIT from that high school. In fact, he was still there when I finally matriculated. I actually met him.

I think, therefore, that I had tremendous support from my hometown in a somewhat unusual way. Racism was around that year, of course, but it did not have any effect on my ability to do my work. I was able to participate in activities. I was on the high school baseball team as a pitcher, for example. The people were receptive, although there were those special incidences which were not so pleasant. But I think what I took from that was that when one has an opportunity to gain, sometimes it's worth going through a little bit of extra social pressure if the intellectual gain is worth it. And in this case it was.

That high school period, you're talking about what years?

That was 1965 and 1966. I entered MIT in the fall of '66, and I integrated this high school in the fall of '65.

That's quite an accomplishment, knowing what I know about the South and coming from the South myself.
Right.

Did you have any knowledge, other than what you just mentioned, about MIT before you actually came to

Cambridge? Did you have any sense about the place at all?

Like I said, this dedicated lady had been teaching chemistry at the school since the Manhattan Project days. Periodically, every three or four years, one of her students was accepted and went to MIT with varying degrees of success. This one who was just before me, for example, had a lot of academic problems. In fact, he barely made it through. I think he finally did finish, but he was on academic probation—or whatever they called it—and he had a lot of trouble with his studies. But she felt like I could manage it. She thought that I would be fine, that I could handle it, and she encouraged me to go there. I was accepted at several other places as well, but she encouraged me to go to MIT. I think that's probably the main reason that I went there, because of her recommendation. I had a very high regard for her professional opinion. She was not beyond the prejudices of the South, of course, but she did not allow that to come into her professional relationship with me.

When you think back, what were your early impressions of MIT once you got there?

My first impression of MIT as a freshman was that it was a place where there was a lot of work to do. I lived in what used to be Burton House, I guess it doesn't exist anymore.

It does.

Anyway, I lived there. I was lucky enough that my roommate was majoring in physics, which I ended up majoring in. He was one year ahead of me, a young Jewish boy—Eric Wolf—from Connecticut. We were roommates for three years, until he graduated. I found that we freshmen felt like we just had a lot of work to do, we needed to concentrate on that work, and we needed to get it done. That's how I remember the freshman year.

My grades started out pretty good. The first set of tests I took I made relatively good marks on all of them, in fact. We were taking chemistry, calculus, and physics, I guess, at that time, and all of them came out quite well. So I was pleased and I continued to work harder. In a couple of the courses, it wasn't clear if I would get an A or not. I was sort of on the borderline. I remember telling my oldest sister Grace, who was an English teacher, "Well, you know, I don't know if I'll get an A in two of those things." She said, "Just do the best you can."

I think that was the way my family looked at it. Whatever I was going to do, as long as I did the best I could, they were going to be satisfied. And in the end I did get A's in all those courses that I just mentioned. That was my first semester, so it was a very successful year for me.

That is not an easy task to do, coming to MIT and doing that well the first semester. That was quite an accomplishment. When you reflect on your life at MIT as a black student there, as an undergraduate, are there any highlights that come to mind?

I thought of my time at MIT as a very pleasant and a very much broadening experience. I was coming from the South, where for most of my life I had lived in a racially segregated environment. Even the movies were segregated. I came into MIT and this was no longer the case. We had started, like I said, integrating a little bit that last year I was there, but MIT was quite a broadening experience.

In my class was Nathan Seely, who now has a Ph.D. in engineering from Stanford. There was also a young lady named Deborah, whose last name I cannot remember. Then I think one other student joined in later on, if I remember correctly—Henry Snelling, I believe. But in any case, we all felt like we were a part of the MIT community. I think one year they made me the social chairman of my floor. I was planning all the parties. All of our parties were completely integrated. There were so few blacks anyway that it would have been impossible to have a party without having it be integrated. But I think we were really accepted at those parties. We were not just there standing on the sidelines watching everybody else have fun. We were very much a part of the Institute.

In fact, everything we did was all-encompassing. That's the thing I remember. I think that was true even in the Black Students Union, when we were forming it. Seely and Shirley Jackson spent more time on that, certainly, than I did—and Sekazi Mtingwa also. Even in that, other types of people were involved. I would say that was my impression of it. It really taught me how to interact with people of all types, all religions, and all colors. We had both liberal and conservative opinions. Just living right next to me we had some very liberal people, we had some very conservative people. We had Jewish people, we had non-Jewish people, we had all kinds of people. I think that was what I learned about during my freshman year, in

particular. We had very rich people and we had some, like myself, who were not rich at all.

I learned that at MIT there was an emphasis on the intellect. This emphasis was not, in our time anyway, associated with any kind of color or religion or ethnic identity or other orientation. It was really all-encompassing. That's the thing I remember most about MIT, and that's why I call MIT the best period in my life. I would say that in that time—in addition to when I got married, I would have to compare it with that—it was really a blissful experience for me. The only thing that compares to it is my marriage.

That's saying a lot. One of the things I've heard from several people, during that period that you were at MIT as a student, was that you were a person who both really performed very well academically and really helped a lot of students in terms of tutoring them, working with them, and helping them to learn some of the physics and chemistry, whatever it might be. Do you recall doing that, helping people like Sekazi and others?

Yes, I do remember that. I helped everyone who asked me any question. We had competition, but that was on the examinations. Outside of the examinations, if you knew the answer to something or if you knew how to do something or if you knew the best way to proceed and someone asked you, you would do it. I did that for black students, but also I did it for white students. I had a double major in mathematics and physics. One math course, which was a little tough, we took as sophomores and juniors—differential topology. One of the white students on my floor was having some difficulty with it. He would come to my room whenever he felt like it, and we would go over the stuff together. It was just the spirit of MIT. So yes, I do remember that.

How did you decide on going into the field that you majored in at MIT?

In high school I liked mathematics, I liked physics, and I liked chemistry. I actually had the best formal training in chemistry, because of this teacher I mentioned to you. So I was leaning toward chemistry. But since I majored in both mathematics and physics, all I did was eliminate the chemistry. I decided to eliminate the chemistry in the freshman year. I did well in the course that we took, but I just found that I enjoyed the math and the physics more. So I majored in those two.

What about the woman who was very instrumental in your coming to MIT, and in working with you?

Ms. Outwell was her name.

Were there any other role models or mentors during that period all the way up to finishing MIT?

At the time I was at MIT, it was kind of interesting. I had focused on the mathematics and physics. I wanted to become a world-renowned scientist, and considered my faculty that. It turns out I wasn't far off. There was this fellow Steven Weinberg and then there was Philip Morrison, I don't even know if he's still there anymore.

Philip Morrison is still there.

Those two people were important. Weinberg I knew at a distance. I was hearing how good he was, and there was some kind of idea that I wanted to be like that eventually. Then Morrison actually supervised my senior thesis. I would say those two probably had the most effect on me as a role model type of thing. It turned out, I didn't know it at the time, that Weinberg and I ended up having the same thesis advisor. I went for a Ph.D. at Princeton and I worked for Sam Treiman, the same man who trained him. But Weinberg has won the Nobel prize and I have not. So it stops at that point. But I did have that kind of role model.

How would you describe your academic performance overall in finishing MIT?

I thought it was okay. I was satisfied with it. We were trying to see who could have the highest grade point average, myself and other guys I knew. I was satisfied with what I accomplished. I saw MIT as an opportunity to really learn a lot, and I felt like I had not wasted that opportunity. I felt like I had really learned a lot. And that proved to be true. When I got to graduate school at Princeton, it continued to show up, that my education at MIT had been an opportunity where I really learned a whole lot. I really did.

You actually had to do very well academically in order to go to Princeton to get your Ph.D. If I remember correctly, you actually went directly to Princeton from MIT.

Right.

This was in 1970, and we know what period that is. That means that wherever you would go in these particular schools, there would be very few—if any—blacks in the arena where you would be. Could you be more specific about how well you did at MIT?

I don't remember the numbers, but they used to have a five-point system.

That's right, still do.

My average was 4.9 out of 5.

I had heard that you did exceedingly well.

I don't remember the fraction, but it was 4.9 or 4.95 or something.

You couldn't be much closer to a perfect score, and we still operate pretty much the same way. Almost all those things are pretty much consistent still. I think that's maybe one of the beauties of MIT. But that's quite an accomplishment, to be able to do that well—at that time, especially.

How was your experience at Princeton? Talk a little bit about that experience and how it compared to the experience you had at MIT. I realize that this is graduate versus undergraduate, totally different in that sense.

It was different in the sense that at MIT we had courses and grades and whatever, while at Princeton they may feel you're some kind of genius and so they don't want to put much pressure in terms of classes and grades. They just have this long general examination that lasts one week, where you're being tested all day long, five days a week or something like that. If you can pass this to the satisfaction of the people you are trying to work for as a research student, then they're happy.

So it was a little bit of a different system. But I think, as far as the opportunity to learn, it was just as good. I felt like I was in a place where I could work. I had narrowed it down to theoretical particle physics that I wanted to go into. I was in a place that was doing things. There was a problem around, when I was there, that is in line to get a Nobel prize now. So I was right at the top of the research arena when I went down there. I didn't work on that problem, my classmate Frank Wilczek did. But the point is that it just was random and I could have worked on it. This was a random thing, that they were assigning the problem and that he got it instead of me.

But they were doing that kind of research. Those men were at the top of the business. Curt Callan, Murph Goldberger, David Gross, and Sam Treiman were the ones with whom I had something to do. They were right at the top of what I wanted to go into, and they had a lot of expectations, a lot of high expectations. That part of it was

similar to MIT. It was just in a very different setting, you know? At Princeton University, the whole campus is different. It tries to be more humanistic, it is a more liberal arts place. In that setting, they had something that was maintaining an academic standard just as high as what I had had at MIT. And I was able to keep up the pace. When I left, I had a record for the time from entry to Ph.D. I don't know if my record is still valid, but I got the fastest Ph.D. on record at that time. That was, of course, in 1973. Whether it has been broken since then, I don't know. Maybe it has been broken.

But I continued, you see. My thesis advisor was very happy with my research, so he got me an appointment at the Stanford Linear Accelerator Center with Professor Sid Drell's group. That, again, was another leading place. During that time I was a post-doc, they discovered a particle for which a guy named Burt Richter did get the Nobel prize. He shared it with Sam Ting of the Institute. So I was right on the top. I was very lucky—not lucky, I guess my work took me to those places. But my work really paid off. The hard work and the academic excellence that I tried to achieve, as best I could, did pay off. It put me right at the top of the things I was trying to work on.

One of the things that comes across very clearly to me is that you are very modest in terms of your accomplishments. A number of your colleagues have talked about you. Essentially, if I hear you correctly, from MIT all the way up to the present, you have been involved with the highest level of research in your field, with those who have been acclaimed with Nobel prizes and all that. Essentially, that's what it amounts to.

That's correct, yes.

I think that's important for the record, because a number of your colleagues have said that to me. You're quite outstanding.

Let me just go back. I have a couple more questions. You are on a major university campus teaching and doing research, so you have a very good sense of the students of today. If you had to give advice to students who are coming on the campus of an MIT today, black students, what kind of advice would you give them in terms of being able to meet the challenge that they're faced with?

My advice would be to tell them to try and take advantage of every opportunity they can to broaden the way in which they accumulate

knowledge, to try to open their minds to every possible avenue that may present itself at a place like MIT. MIT has many avenues for them to actually learn as much as they possibly can during that time. I feel like I learned a lot in my time at MIT. It was the time in which I believe I learned the most. Maybe Princeton was similar, but during that time at MIT I learned the most per year I've ever learned in my life. I'm very grateful for having had the opportunity to do that. I think when somebody is admitted to MIT, if they don't do that, it's a waste of the resource—it really is. That would be my advice.

If you had to say what was best about your experience at MIT and what was worst about your experience at MIT, what would you say?

I would say that the best thing about my experience at MIT was that it opened up such a wealth of knowledge to me that I will forever be grateful. I feel that was the best thing that MIT did for me. It simply opened up such a wealth of knowledge, more than I could have ever imagined as a high school student. I was very much taken with that.

I don't have any way of identifying any worst thing. I don't think, during my time, I can cite any worst thing. I guess I read sometimes in this alumni paper that they sometimes even have a racial incident now, or people being called names. But during my day I couldn't have imagined having a racial problem. In one case recently, I read about some blacks walking in the alley right behind Baker House. I couldn't imagine it. I used to walk back from the libraries and whatever, when we used to study at the student union, and never had a problem. I read that there was some name-calling or whatever recently. But I used to come down that alley at all different times of the night, weekends or whatever, from studying in the student union, which used to have a library open twenty-four hours a day, and I couldn't have imagined someone calling us—me or anyone else—a name. We felt a part of the Institute, and the Institute felt a part of us. That seems to be a little different from the way it is now. There is some more of this tension among the students now. We didn't have this, at least during my four years and in my experience. I don't have anything negative that I can point to.

We still admit close to about a thousand students a year. It's a little bit more now than in your day, but it's not

much more than four thousand students total on the undergraduate level at MIT. That's been pretty much standard. During that four years, during that time you were there, there couldn't have been in each class more than about six black students, is that right?

I think less. In my class, I believe it was less. I remember at one point there were eight or ten people in the undergraduate population, black people.

Eight?

Yes, at one point—eight or ten, something like that. My class was, I think, four—and the one in front was a couple. It was really a small group.

And each one of you were scrutinized very, very carefully. Today, since that time, we've averaged close to about fifty to sixty black students per class.

Oh, very good.

The numbers certainly have changed, and I suspect several other things have changed in regard to that. Sekazi, I think, shares your views on that as well.

Is there any other topic that comes to mind, as you reflect on your own experience and on the experience of other blacks at MIT?

The only thing I can say is the kind of thing that probably MIT doesn't have too much control over. As an institution, it really cannot control people. It can only present an opportunity, it cannot make someone take advantage of it. It can try to stimulate up to a point, but there's the individual freedom that will come in there and block that if it tries too hard. It can just present the opportunity to really excel in the accumulation of knowledge, and to really excel in the broadening of oneself. But it cannot force the students to do that. That's something that is just in whatever the culture is going to provide.

I would say that that's probably the main difference that I can see, looking at it from a distance, from these few magazines or whatever that I do have a chance to look at. When we came through, there was an integration movement. Martin Luther King had just recently been stopped, but his ideas were around. When we arrived there, he was still active and there was a mood in the country for people to try to come together. There was a sense of everybody coming together and trying to make things better, trying to create a "great society."

That kind of mood doesn't exist today. Today is different. There are people out there who are

saying that everything has been even now since the anti-discrimination laws were passed, and that there's no need for any special actions. It's just a different attitude. You can find all over the country now people who have a totally different orientation toward themselves, toward other people, toward people who look or don't look like themselves and who worship or don't worship. It's all different. It's not like it was when we came to MIT.

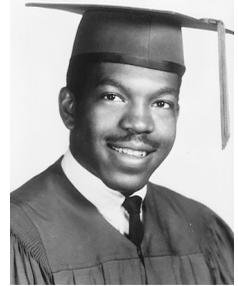

I think a lot of the trouble that students now have taking advantage of MIT can be traced back to the fact that this culture has changed. If I was seen in a lab with a white student, I didn't get anybody asking me a question about that from a social perspective when I went to dinner. There was no thought of anything like that. But I know, from having had students when I was an instructor at Princeton—and that was some time ago—that such a question would conceivably be raised in today's environment.

That is the kind of thing I would say, that I believe the Institute is doing the best it can given the culture. I would simply ask the students, given this culture, are they going to let the culture stop them from taking advantage of MIT? I would ask the question. You asked me for some advice. Well, my advice is simply a question—are they going to allow the culture from which they came, from their high school or wherever, to stop them from taking advantage of the great opportunity that MIT has to offer them? That's my question, and I leave you with a question.

Well, it's an excellent question.

JAMES M. TURNER

BS 1966 Johns Hopkins University, PhD 1971 (physics) MIT; staff appointment as research assistant, MIT, 1966-1971; taught at Southern University and Morehouse College before joining the staff of the US Department of Energy (DOE) in 1977; program manager, DOE Office of Fusion Energy, and international collaborations manager, 1977-1988; director, Office of Weapons Surety, 1988-1994; manager, Oakland Operations Office, 1994- ; deputy US negotiator for dismantlement of nuclear weapons in the former Soviet Union, 1991-1994; senior DOE representative, Operation Auburn Endeavor, 1998, to safely package and transport weapons-grade nuclear material in the Republic of Georgia.

I'm married. I have five children, three from a previous marriage. I have a set of twins, Malcolm and Rachelle. They are now twenty-six. Malcolm is at Harvard. He's in a joint program with the Harvard Business School and the Harvard Law School to get an MBA and a JD. Rachelle works as a financial analyst in Washington. She has recently been accepted into Duke's MBA program and will be starting that in September. My next child is Nat. Nat finished Duke. By the way, Malcolm finished University of North Carolina, Chapel Hill, in 1993, and Rachelle finished Wellesley in 1993. Nat finished Duke in 1994. He works for Hallmark. He recently was transferred from Florida to their headquarters in Kansas City. His primary responsibility is to increase the percentage of minority store owners and suppliers to the company. He'll be getting married this summer. He's the first of my children to get married, and I'm very proud of that.

Then I have another son, James M. Turner IV. James is fourteen. He's a freshman at Monte Vista High School. I think as far as a career goal, he loves computers and I think that's about as focused as he has gotten at this point. Then my youngest child is Lauren. Lauren is twelve. She has a deep interest in marine biology. She is also an outstanding soccer player and track athlete. She also gets pretty much straight A's in school, so we're hoping we'll be able to parlay that into a good college education.

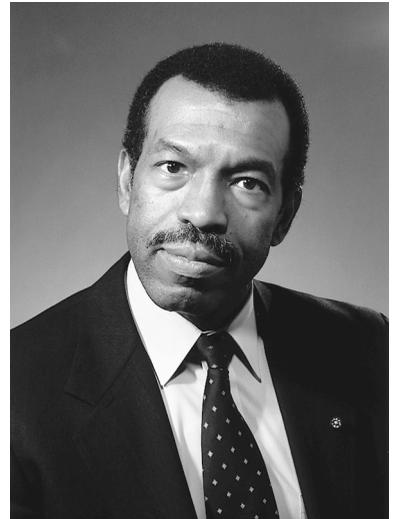

My wife's name is Paulette. We've been married sixteen years, almost sixteen years. She's originally from Connecticut and her field is accounting. She has a degree from the University of New

Haven. I consider myself truly fortunate to have her as a spouse.

Say a little bit about your parents.

Let me just mention too about my sister. I have one sister. She lives back in Washington, DC. She also has a set of twins and they're graduating this year from Wake Forest University. One will be going to medical school next year and the other will be going to grad school in a combination of French and Spanish. So again, we're very proud of them.

Let's see, my parents were both college-educated. My father graduated from Howard University. My mother graduated from Columbia University in the School of Nursing. We had a household that was very traditional as far as values are concerned, so things like respect for others and a very firm work ethic were ingrained in us from the earliest of times. In fact, the unofficial

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with James M. Turner in Oakland, California, 7 March 1997.

motto for our house was the thing from Caesar—“Veni, Vidi, Vici,” “I came, I saw, I conquered.” So for my sister and me, what that meant was that we never wasted time trying to convince ourselves that we could do something, we focused on how we could get it done.

But again, I really appreciate my parents. They both stressed education. Before I knew what college was, I knew the expectation was that I would go to it, whatever it was. It was never a question. In fact, I was well into my thirties before I finally discovered that, as I was going through school, I always assumed that I had no choice. I had to like every class. Literally, my father would kill me if I came home talking about how I was bored in class or something, because to them learning was a privilege and it was precious. Just like you wanted to go up the steps from the first floor to the second floor, you can’t decide, “Well, I don’t like the sixth, seventh, and eighth steps.” Education was a way to get from where we were to where we wanted to be. We basically didn’t have any options. We liked every class we took, no matter what it was. I appreciated that. We also came up with an atmosphere of community in the neighborhood where our neighbors had a role in our upbringing. If we were misbehaving, they would tell our parents and we’d be in for a whipping. And that was great. Both my parents are deceased now, but I really greatly admire the values that they gave us, and the work ethic.

Obviously, they were tremendous role models and mentors for you. Beyond them, in your high school days, who were the people who stood out in your mind who were very influential in your life?

First of all, let me just say that usually this is where many people start talking about their grandparents. But it turns out that out of my four grandparents, three of them were dead before I was born and the fourth one died when I was about four or five years old. I grew up in DC and she was in Ohio. I have essentially no recollections, so I can’t give you a grandparents story. But quite frankly, my father was very good at math and I started off wanting to please him. That’s why I got interested in math and science, and as a young child—I’m talking about age six, seven, and eight years old—it was a priority for me because I wanted to please my father. I put the extra time and attention to it, and I got good at it and enjoyed it. Then it became

less of trying to please my father as opposed to something that I looked at for self-fulfillment.

My mother certainly was the greatest person I’ve ever met, hands down—both as a person and as a thinker and scholar. There’s no comparison. Both my parents are obviously on a pedestal, but my mother just clearly stands out. Through my mother, I learned the value of family. Her family was the tightest, closest family I have ever seen, and that led to another person who had a lot of impact on me. That’s a cousin I had, Grayce Brent. Grayce was the daughter of one of my mother’s sisters. When the sister died, the children were parceled out to the rest of the family to continue their upbringing. Grayce came to live with us. I guess she was finishing high school at the time and I was just a baby. But she was always like the older sister to me. She certainly reinforced and complemented the messages that my parents gave and the values they tried to instill. Then when she married, her husband, Booker Brent, I immediately developed a tremendous admiration for. He’s an architect. He’s one of these people who doesn’t say much, but when he says something, you stop and listen because he’s very thoughtful. And again, there was that sort of technical background, that sort of fit into what my father was interested in and where I was headed.

But again, I think that as well as the many family friends that we had, and aunts and uncles and things like that, they were all very consistent. The message was the same, “You’re going to make something out of yourself, even if we have to beat you to death to make it happen.” There was always the high family expectation of achievement, and even though my mother was the first in her family to go to college, still all of her sisters and brothers—my aunts and uncles—even though many had not finished high school, they still understood and treasured and valued education. All were very successful in their own ways. It was something that was just a very solid, clear, unequivocal expectation of us.

Given all that, in the high school then, you had no choice but to excel.

Right.

I suspect you did. How did you do in high school?

I went to Gonzaga High School in Washington, DC. Last year we celebrated our 175th anniversary. It is a Jesuit high school. The Jesuits were very

strict and very traditional. They insisted on excellence. They had a very good balance. They set the bar very high for us to aspire to. Then when we achieved that level, they on one hand patted us on the back and said we did a job well, but on the other they kept the stick out to say, “You don’t stop here. You’re now going to reset the bar a little bit higher, a little bit farther out of your reach.”

So I think it was an excellent experience. Also, I was in an honors class there. That was also an experience for me. It was the first time in my life when I really had to study. Things did not come easily. They instilled in me a work ethic that I still employ today, and so I feel a tremendous debt of gratitude to them. I still contribute financially to the school because, again, I feel that much loyalty and admiration for what they did. I thought it was just an outstanding education. We had four years of Latin, four years of English, two years of German, a year and a half of college level chemistry, a year and a half of college level physics, a year and a half of calculus before I left.

So it was just an outstanding education. The whole time, it was pushing everybody. People today may talk about stress and all this foolishness, but this school was really pushing us to develop ourselves and then, once we reached the plateau, pushing us on to that next plateau and not letting us rest. Fortunately, at the time I appreciated it. But now, as an adult, I’ve grown to appreciate it that much more.

Do you recall how you actually determined where you would go to school? Basically, what I hear you saying is that it was not even a question about whether you were going to go to college. But what about that whole process of going through selecting what school you would go to? I can’t remember the details of how we settled on the schools, which schools to apply to and all. Certainly we were not wealthy, so financial aid played a role in it. For me it came down to, for an undergraduate school, between RPI and Johns Hopkins. Basically, I chose Johns Hopkins. I think it was one of those things. When we were doing these things, we sort of looked at them as life-and-death decisions and things that were going to change our lives forever. But again, looking in hindsight, it was a win-win situation because I think both of them were good schools.

At Hopkins I did very well, pretty much got straight A’s. But there were some things that hap-

pened to me there that began to certainly raise my consciousness as a black person. At the time I started at Hopkins, Baltimore was not an integrated city. Even though I never had any problem with any other student, there were never more than eight black students in the undergraduate school at any one time.

We were in a situation where all the freshmen had to live in freshman dormitories. When I was a freshman, there were two of us—two black students in the dorms—and we were roommates. The next year there was one student, and he had a single. Some of this was beginning to sink into me because I just never really had a consciousness about this before. I mean, I just considered myself one of the people and never saw myself as a black person, just saw myself as a person.

I guess there were a couple of really poignant incidents that occurred. One I recall when I was a senior. I majored in physics. I was just walking around in the physics building. My father directed me to one of the places that I was going to apply to graduate school—Johns Hopkins—so I was going around distributing some recommendation forms. I remember the secretary came up to me and asked me if I was lost. On the contrary, I was not lost. I knew exactly where I was and it turned out that they had just done an article on me in the Hopkins magazine, about being first in my class.

So that began to sink in. Also, it began to sink into me about some of the things that I guess I had just not noticed. I began to think back when I was getting ready to enter as a freshman. I remembered there was a questionnaire we had to fill out. It asked questions that actually, in hindsight, I think were quite offensive—things like “would you mind a Negro for a roommate?” But again, all that was in hindsight. On balance, though, I got what I came there for and that was an education. It prepared me for the next step, which was going to MIT for graduate school.

*You’re really talking about what period on that undergraduate level at Johns Hopkins?
'62 to '66.*

The number of blacks in the entire school, not the class, was no more than about eight.

The whole school, right. In 1963 I remember they admitted their first American black student to the medical school, and that was a big deal.

But even though that number was so small at Johns Hopkins, you still ended up being first in your class.

Yes. I studied hard. I joined a fraternity. There were several physics majors in the class ahead of me and these guys actually proved a tremendous resource. They did a good job of kind of taking me under their wing and all that, although I did a lot on my own. Still, though, particularly when it came time to thinking about graduate school, I really paid close attention to what they were going through—the kinds of things they were asking, what things they were putting on their applications—just so I would be ready to deal with that.

I worked very hard. One of the things about the fraternity was that we prided ourselves on our academic averages. It was really a carry-over from the kinds of things my parents had instilled in me and that I had gotten from high school. There were so many students who I recall came in as freshmen and all they talked about were their board scores and all that. That was fine, but we were in college now and the time for that had ceased. So while they were talking about their board scores, I was studying. I decided that there were probably a lot of people who were smarter than I was, but there was nobody who was going to work harder than I did. I decided that my path to success was to out-work everybody else, and that's what I did.

Well, it sounds like the family tradition sort of passed right on to you.

Absolutely. Now I wish I could pass it on to the next generation.

What did you do next? You did well on the undergraduate level, so you're thinking about moving to another level. How did you come to decide about where you would go next, and where did you go?

The choice for graduate school came down to MIT and Columbia. I knew I wanted to continue in physics. There were two things, a couple of things that influenced me. One, I had a chance during my spring break of my senior year to visit both campuses. I wasn't sure precisely which field of physics I wanted to go into. MIT had a very large faculty, a lot of different areas represented, whereas Columbia's was small and much more focused. Then there was a friend of mine from Johns Hopkins, who was a year ahead of me, at Columbia as a graduate student. When I visited the campus, that's why again it helps to do these kinds

of things, I bumped into him and even though we had different personalities, he hated the place and talked to me about that. So I took that into consideration.

But also it was a positive selection at MIT. I just fell in love with it when I got up there. Also, I think deep down inside I wanted a challenge. MIT was the best, and I wanted to see if I could run with the big dogs. I think that was a big part of it.

What did you like about it when you first came here? You said you liked what you saw.

I didn't much care for Boston, but I liked the resources they had, I liked the atmosphere there, the stress or emphasis they had on learning. Again, just the challenge of it all to me was important, being able to rise up and meet that challenge. Then also, as I got to know some of the other black students there—like Shirley Jackson, like Sekazi Mtingwa and other folks who were there—that certainly helped to get settled in. They were undergraduates at the time, but I think it certainly helped me just to get settled into the campus and find my way around and just kind of know which end was up.

Talk a little bit about your overall experience at MIT, the academic as well as the social. What are the significant things that you remember about being at MIT?

Let me just start by saying that I was just up at MIT a week ago for a meeting of the National Conference of Black Physics Students. It was the first time I had been back to MIT in probably about thirteen or fourteen years. I was just struck by how many good memories I had of the school. In fact, I'm not a sentimental person, but on the other hand, as I was driving to the airport, I had to pass by Building 37—which is now the Ron McNair building—where I did my graduate work, and also by the Great Dome. I couldn't leave town without at least passing by those places.

So to me it's a very positive experience, a very good experience. Clearly, the academics were excellent, but also that's when I really sort of developed black consciousness. Also, I really take my hat off to the school and people like Paul Gray. When black students gathered together and we formed our Black Students Union and all that, and we began to press for a greater enrollment of black students, the school was entering into an area where it had no data. And again, with those technical types, they want to have data. I must say, on

sort of a global level, with Paul there, he asked us some very tough questions and some very legitimate questions. It forced us to get our arguments together, to have our ducks lined up, and to make sure that we were ready. I really applaud him because he took a risk in trying some things, accepting some of the recommendations and suggestions that we had. Also, the thing that I most appreciate him for was the fact that he kept his word. When he said something would happen, it would happen. There was no need to check or go back or anything like that. It was done. It was done in the first-class way that MIT does everything, and I appreciate that.

But it was also difficult for us because we were students. While we would take time to get involved in these things, the people we were competing with—our colleagues and peers—had that much more time to study or do something else. So it was a difficult chore, but it was something that we were all committed to. Again, I think it was something that the school became committed to. It was a learning experience for, I think, all of us.

I must say on a personal level, one of the people—besides Paul Gray—whom I admired from the faculty and the administration was Al Hill. Al was chairman of the physics department at the time. He, in a way, sort of took me under his wing. I know I didn't get any favors or anything like that, but on the other hand he made sure that I kept my eyes focused on my objective, which was to graduate with a degree. There were several times that he got me back on the right path where I needed to be. Also, there were a couple of occasions where I had to take some part-time jobs because of money and all that, and he removed that as an issue. I certainly appreciated that. But again, I had to toe the line just like everyone else. I appreciate the fact that he respected me enough that yes, I was going to be held to the same standard as everybody else, and that was done. That was what he did for me on a personal level, and I certainly appreciate that. He may have done it for countless other students too, but it just wasn't his style to talk about it.

He just did it.

He just did it and didn't take any bows for it. Again, I appreciate the confidence and the interest that he took in me. I really feel a sincere debt of gratitude to him also.

I think all my experiences at MIT were very positive ones. Some of it involved kind of learning the lay of the land. I remember when I first came, my first year, I had come out as this hot shot from Johns Hopkins and thought I was ready. But then I kind of had a couple of rude awakenings. First of all, there was a big difference between MIT and Johns Hopkins, number one. Hopkins was a good school, but MIT was just in a different league, it seemed to me.

In addition, it was one of these real-life lessons that one needs to learn. I remember the classes I had my first semester, my first year. I was working by myself and I remember killing myself over these problem sets. I remember when we would turn them in that many of the white students would say, "Oh, this problem is trivial and that problem is trivial." And I'm saying, "Trivial! You know, I killed myself over these problems, what do you mean?" So I began to doubt myself. Then I figured out what was going on. They were getting together in study groups. If we had ten problems to do over a two-week period, I was doing all ten of them by myself, and on the other hand they were divvying them up so maybe one person would only have two problems to do over that two weeks. Yes, I guess—given that—they probably were trivial.

But once I decoded that, I was able to accommodate that. I think many of the black students, I think we really helped and reinforced each other. I think another person there who was very helpful to us was Ron Mickens. Ron was a post-doc at the time and gave us fatherly words of wisdom, even though he wasn't that much older than the rest of us. But he had been through this thing. He had already gotten his Ph.D. and all that.

Among other people who had a big influence on me, I remember there was a Jesuit priest, Bill Burke—white Irish-Catholic from Boston—and we formed a study group. When we met, Bill lived in a rectory over in Back Bay and we would meet a couple of times a week studying for our general exams. We would meet over at his place. He had a board set up. It was quiet and we'd get together maybe three nights a week. There were three or four of us. Again, he was really good, really one of the nicest people I've ever met.

As it turned out, he passed his general exams his first time around, and I did not. In fact, he was the only one from our group who passed his the

first time around. But the thing that really impressed me about him—and again, one of the things that I will always remember him for—is that in spite of the fact that he had gotten through, and had started his research for his dissertation, we kept the group together. We continued to meet over at the rectory. He was still just as active a participant as anyone else. So I got through the second time. But he didn't have to do that. He could have just said, "I've got mine, you get yours and have a nice day." But there was more there than just some superficial friendship.

As we got to know each other, it turns out that he was also going through a critical period in his life. He had become a priest—not by choice but because he was the youngest and nobody else had gone into the priesthood, so it was him or the shame of not having anybody do it. It was kind of thrust upon him. In his words, he didn't know how to tell his grandmother that he didn't want to do this. But now he was having some second thoughts about his career and where it should go. He had some tough choices to make too. He eventually decided to leave the priesthood, but again I think this speaks to the kind of integrity this person had. He reimbursed the Jesuits for the college education and the graduate education that they had given him. That's just the type of person that he was.

Those were some of the main features, but I just thoroughly enjoyed my time there. I enjoyed the people I met. Also, when you get in that environment, you sort of take a lot of stuff for granted. The first job I took was at Southern University, an HBCU in Baton Rouge, Louisiana. After I had gotten out of Boston and all the facilities and resources that were so readily at hand, I began to miss them. I loved MIT, what I got from it and hopefully what I contributed to it.

I also have talked to other students who were there when you were there, including some you've mentioned. They have talked about the role you played. You haven't said very much about your activist role there. One of your colleagues and good friends, Shirley Jackson, when I interviewed her, said, "You must talk to Jim Turner because he was very important in my life and the things that we were able to do." I suspect a lot of it had to do with working with Paul a lot. But you had a lot to do with the BSU and a lot of other things, and even though you were a graduate student, there were a lot of things you did. Talk a little bit about that kind of experience.

Well, Shirley and I met. It turns out we grew up a half-mile apart from each other in Washington, DC, but didn't know it until we got to MIT. Clearly, within two minutes, you know that Shirley is somebody special. There was sort of a critical mass, and quite frankly we met and talked through some things. My former wife was coming out of a civil rights background. She integrated the University of South Carolina, so we were talking through some of these things and decided that we were going to take a stand. I think that it was important that we had each other for support because it's very difficult to maintain that high energy level, that high commitment level. There are times when it's late at night and things don't look like they're ever going to work out. You're sort of on the verge of just throwing it all over the side, and then somebody comes. Sometimes maybe it's just a word, sometimes it's maybe just a look. That sort of charges your batteries and gets you to keep on.

Shirley and I helped form the Black Students Union. There were some ups and downs, and I'm happy to say that I don't think there was ever an issue where we had a personal disagreement. We may have disagreed on strategies and tactics and all that, but I think it always revolved around the job that needed to be done. And there weren't that many instances. I don't want to give you the wrong impression, but we were still able to do it in a way where we could walk out regardless of disagreement and be able to work together. There was never a sense of a winner or loser. We just agreed, "This is the best way to move on and we're both committed to it, let's do it."

Quite frankly, it was a joy working with Shirley because she brought the same kind of intellectual depth and thoroughness that she brings to her physics. Invariably, she would think about four scenarios that all of us had missed. She was always up front about asking the what-if question. "What are you going to do next?" I'd say, "Okay, I guess we can't adjourn this meeting quite yet." I mean, that was great. She also shared with us. A lot of us were new to MIT, and she was very open about sharing her experiences with us—what worked and what didn't work, and where people might be coming from. Again, it was just a pleasure and an honor to work with her and to know her, as well as the other students. It was just a matter of reinforcing each other.

Also, we had to learn a lot of this on the fly. I always felt comfortable about being able to discuss anything and everything with Shirley. I didn't feel at all vulnerable in sharing with her doubts, concerns, weaknesses that I felt, and I would hope she felt the same way. Quite frankly, I feel very happy for her to see her career and how it has advanced. Again, I have the highest admiration for her. And I guess one of the reasons I haven't said much about myself is because it was always team effort. I guess I just never considered myself as an individual because it was all as part of a team. It was a team to the extent that we all succeeded together or we all failed together. For one or two of us to succeed, and the rest not to, was an unacceptable solution or outcome. I mean, I always viewed it as a team concept. There were some frustrations too. Obviously, we would have loved it if all the black students on campus had been a part of the Black Students Union, but some chose not to and that was certainly their prerogative. Some of the things that we did also shaped some of the years after I left MIT.

Very much so.

One of the things that Shirley and my former wife and I did was that we wanted to start a black school that was focused on science and technology, science and engineering. We got catalogues from everywhere. We read them and all that stuff. Yes, that was really my first exposure to black colleges other than a summer geography class I took at Howard. I took that, quite frankly, just for the social benefits, but it really was an eye-opening experience. It got me to think on broader levels.

Actually, the first thing I wanted to do coming out of graduate school was to teach in Africa. About a year before I finished, I started writing letters to African embassies all over the continent, because we wanted to go over for a couple of years and teach and help out. Money was not the issue. I was asking for enough so I had a roof over my head and maybe one meal a day. One of the disappointments I had, quite frankly, was that—and I don't know the reason why—the only response I ever got was about two weeks before my graduation. I had sent these things out a year before I graduated and I obviously couldn't wait for these people to make up their minds, so I had already accepted a position at Southern University. I don't know the reasons why, but certainly it was what it was and that was that.

But again, Shirley and others were great assets—Sekazi, but also people like Warren Shaw. I know Warren is a fund manager and has gotten written up in several magazines.

Warren Shaw.

Yes, and others who were great assets. Also, quite frankly too, in that period I also had the privilege of getting to know and meet Ron McNair. Ron came up—he was a student at North Carolina A&T—to spend his junior year at MIT, and then he came back for graduate school. Again, that's somebody you talk to for ten seconds and you know that you're in the presence of greatness. That was certainly a big loss to us all, but he certainly showed the light for us. Mike Fant is another guy I remember—a really high achiever, had his head screwed on right, a fighter.

So we had a lot of different personalities, a lot of different things that we brought. But I was always happy that we could stay together as a cohesive group, that there wasn't any squabble about who's leading who and somebody getting mad and going off and doing their own thing. We stayed together as a cohesive group. We kept our eyes focused on things. Also, I think, maybe we didn't fully appreciate it at the time, but to do something like Project Interphase was a bit of a risk for all of us because we didn't know what we were doing, what we were getting into. But I think we took it as something serious and something we were all committed to. I was very happy to see it still surviving.

We're quite thankful for you and Shirley and the others because, basically, you really set the stage for what we actually are doing now. Those things, as you've said before, are the things that we're doing now and they have virtually not changed that much. It was your brilliance as students, to have a vision and the comradeship and knowledge and power to force the institution in many cases to do these things. I don't take it lightly, Jim. I know you're a very modest person in that sense, but it's very important that we get a sense of how you have been able to be trailblazers in that sense.

One of the things too that I've really appreciated and was very happy for in our group—there were many groups of students on many campuses who were doing similar things—was that we pushed for more black workers on campus and better conditions for those workers who were there, including the people who changed the beds, who washed

the dishes, who did those kinds of things. We tried to also keep that as part of our focus because those folks were important too. They had families and mouths to feed and they deserved opportunities also. I just am very proud of the fact that we also tried to push for those kinds of things.

There was also, for me, another impact, and that was that I could see MIT stepping out and being aggressive and bringing in hundreds of black students each year. I would look back to Johns Hopkins and they're still at the five and ten level, and they're saying they can't find anybody. That really infuriated me about Hopkins. Now they're trying to take some steps and I've had some involvement with that. But if a school like MIT can find a couple of hundred of students—Hopkins, why can't you find ten?

Also, it was an eye-opener to talk to some of the faculty. I remember we had some very frank discussions with people in the math department. Quite frankly, the folks who were there felt that because they contributed each year to the NAACP, that that was it. "What more are we supposed to do? We've done our thing." So it didn't bother them in the least that they couldn't remember any black students in the math department. They didn't see any problem with that, whereas the physics department was a lot different. They did view that as a whole and as a deficiency, really took it as a serious thing. To us, it was an education too. We did what we could.

Well, you did more than perhaps you even thought that you would do. Do you have any sense about what kind of experiences at MIT, general or specific, have helped you most in your career up to now?

I think a lot of that has really been the confidence in just striving to be the best at the best place. Some of the things that I've done subsequent to that were things that were new areas to me. Again, that sort of confidence I got because of being able to succeed at MIT helped. I think too, quite frankly, I know for a fact—even though I can't document it—that having the MIT beaver on my finger and the MIT name opened some doors. Compared to other black students, who are certainly just as capable or maybe even more capable, the fact that I had MIT next to my name sort of gave me some instant credibility and provided opportunities for me which may have not been available under other circumstances. I think that certainly has been a benefit to me. I think, too, just

watching what goes on there, I was certainly gratified seeing last week at the National Conference of Black Physics Students almost two hundred black physics students. In my wildest dreams—my wildest dreams weren't even at that level. So just to see that.

Again, I think what the school provided as far as an educational foundation, but also what it took to get that—the work that it took, having to deal with different people, many different types of people, and just the confidence that you have. Again, you're tracing back to what our parents did for us. It just sort of reinforced that. For example, when I got involved with some of this work in helping the former Soviet Union dismantle nuclear weapons, I didn't know about foreign policy. But on the other hand, I had every confidence that I would learn enough to be effective, and I think we did make some progress and did some things that were important—the fact that the Russians have subsequently come back to us and said that they needed something, and to have the United States government step up to the plate and be constructive because it was in no one's interest to have a problem or weapons stolen or a weapons accident. To lead the Department of Energy side on that, I think was a privilege. I work with just some absolutely first-class people in the government, in different agencies. Then to look at my Russian counterparts across the table—people who did have first-class jobs, but the world changed on them—they did everything that was expected of them and they did it well, but the world just changed.

Those were experiences. For me too, there was one poignancy about it. I remember when I was about eight or nine years old, growing up in Washington. This was in the early to mid-'50s, when we were having air raid drills and things like that. I remember one summer evening I was at home. The air raid sirens went off and for some reason, this time for me, it sounded real. I remember hearing a plane streak overhead and I said, "This is it! This is it!" So I went and hid under the bed in my room and did everything they told us in the civil defense drills. I was scared to death and I started crying. I was just hysterical almost. I remember my parents running upstairs to see what in the world this was all about. It took them I don't know how long to get me calmed down and convinced not to worry, that we were not getting

bombed. When I was doing some of that work, I remembered back to that incident and I said, “Gee, I want to do this well because I don’t want my children to have to go through that kind of fear of destruction and death and all that.”

Again, I think the MIT experience helped in both tangible and intangible ways. There was that instant credibility, then just the rigor and the training that we had gotten. Again, to me, it’s just sort of an unbroken chain that started with my parents and family and friends. I went through high school training, went through MIT, and then later. It was all consistent, it all fit together. The challenge now is to pass that on to my children, and I think of my older children. Again, I think they deserve a lot of credit on their own, because they’ve had situations where they could have gone off track. But they have stuck to it, they have all been successful, they’ve all got great futures in front of them. I’m now focusing on my twelve-year-old and fourteen-year-old, trying to get them over the hurdle. My wife and I are very much together in that.

Again, I just look upon my time at MIT with a lot of fondness and nostalgia. It just was a great period of time for me, even though I worked pretty hard. It’s a time that I’m very fond of remembering again, as people like Paul and Al Hill and Shirley and folks like that made that all an experience that I was able to get through and then to appreciate.

You’re extremely eloquent. It could not have been said better. I think you’ve really covered the ground. It’s really a privilege for me to have a chance to talk to you. I see why the others told me I had to talk to you.

Well, I certainly appreciate this opportunity. I also appreciate the kind words. I guess one of the things that I really should have done and never did was to go back to people like Paul and Shirley and just tell them how much I appreciated their impact on me. I guess I take that as something now that I’ve got to do. I hope my body language would say that, but on the other hand I need to make that explicit because I think that has really shaped who I have become and who I will become in the future. As we discussed at lunch, I don’t consider my career over yet. I think it’s still on that positive slope, so I’m not ready to start writing memoirs yet.

WILLIAM J. HECHT

SB 1961 and SM 1976 (management) MIT; management positions with United Technologies and the New York Telephone Company before joining the MIT staff in 1967; associate director of admissions and director of the Educational Council, MIT, 1967-1976; manufacturing and personnel officer, Waters Associates, 1976-1980; executive vice president and CEO, Association of Alumni and Alumnae of MIT, 1980- ; chair, *Technology Review* and Residence System Steering Committee; member, MIT Faculty Council, Administrative Council, Committee on Resources of the Institute, and Advisory Council of the MIT Museum; board chair, University ProNet; director, Harvard Cooperative Society.

I'm a New York City kid who was born and raised in New York City. I was an only child, with relatively older parents. My dad had been a native of New York, too. I went to New York City public schools. From about sixth or seventh grade on, I was a bus-and-subway commuter. I went to Stuyvesant, in Manhattan; my dad had gone to Stuyvesant, thirty-two years before. We actually shared two of the same teachers, one in chemistry and one in English. Both had been very young men when they were teaching him, and they were very old men when they were teaching me.

That's one of the best high schools, traditionally.

Right. It's one of a handful in New York City, what we would call "magnet schools" today. In those days, they were just special New York City high schools. They drew from all over the city. We had kids from all five boroughs, we had kids from Staten Island, we had kids from you-name-it. They were coming to Stuyvesant because it was one of about eight or ten schools, some of which were specially focused. Bronx Science and Stuyvesant were both focused on science and math. There was Music & Art, there was Performing Arts, and there was Hunter College High School, which was the women's school. In my day, Stuyvesant was men only—we had no women in our high school.

My dad had been a salesman. He missed the Second World War, largely because by the time they got around to drafting him, he was over thirty-five. I had always wanted to come to MIT, and I came to MIT in 1957. It was a very different time then.

How would you describe your performance at Stuyvesant?
Well, I was pretty good. In fact, I thought I was *very* good. It was the great leveling influence at MIT that changed my view. We had about seven hundred kids in my high-school class, and I think I was twenty-fourth or twenty-fifth. I did awfully well in just about everything.

It was an interesting time. I would commute about an hour each way and did a lot of activities which were always extra—played some football, was on the debating team, and wrote for the newspaper. I loved New York. I thought it was the greatest place in the world. I thought Boston was a really provincial, quiet, sleepy place when I came here. This was more than forty years ago, a long time ago.

How and why did you choose your field or career, and who was most influential in your choice?

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with William J. Hecht in Cambridge, Massachusetts, 9 September 1999.

From when I was a little kid on up, I was in love with airplanes and I wanted to be an aeronautical engineer. I came here to do aero and astro. The year 1957–58 was a good news–bad news year. In 1957 Killian, who was the president here, went to Washington as science advisor. It was a bad news year because in the spring of 1958—these were the latter days of the Eisenhower administration—there was a huge downturn in the defense industry. In those days, Long Island had a whole bunch of airplane makers on it. Fairchild was out there, Republic was out there, Grumman had a huge plant. They actually started laying people off in phenomenal droves.

So even though when I was a freshman at MIT, I wanted to do aero, between my freshman and sophomore years I had a job for the power company in New York—Con Ed—and my dad, who graduated from college in '29 and lived through the Depression and a couple of years with no work, said, “Boy, you’d really better think about this aero stuff. I mean, does it have a future?” There was no space program in '58. They were just beginning to build jet airplanes, and everybody said, “Ah, they’re going to build twenty or twenty-five of them. Who needs them? We have DC-7s, DC-6s, and you can go anywhere you want in the world.”

So the only bad advice my father ever gave me was, “You probably ought to think about getting out of aero and astro.” So I did. I went into electrical engineering, which was a disaster for me, although I made some good friends here in the department—John Tucker, whom you may or may not know, and there were good faculty and good teachers. But I sort of flopped around until the middle of my junior year, and then I transferred into management.

I actually couldn’t believe how easy management was for me. It was like, “This can’t be a subject.” There were all these things that appeared to be obvious to me. I think what was clear is that that was the right thing for me to be doing. It’s something I’ve carried whenever I advise students or other people. I say, “Look, find something you really love to do—find something that feels easy to you. That doesn’t mean it’s all going to be easy. There’s hard work there. But find something that just feels natural and comfortable, and do as much of it as you can.”

So anyway, I ended up graduating here in '61. The last two summers I worked for the Telephone

Company of New York. I went from the power company to the telephone company. Again, you’ve got to understand—Depression-era family. My mother said, “You’ve got to get a safe job, a secure job.” So I spent a couple of years with New York Telephone. It was a great learning experience for me. I learned a lot. One of the biggest things I learned is that I couldn’t stand working for the telephone company. It was more regimented in those days than the U.S. Army. There was a style of dress. We were told, as young managers, that you had to wear a hat. The joke used to be in New York in the summer, if you saw a guy with a hat on, he either worked for IBM, the phone company, or was an FBI agent. He had to be one of those three guys. Who the hell else would wear a hat?

So in '63, I quit the phone company. I went to work for United Aircraft for about five years, in Hartford. My wife and I bought a little house. I was pretty certain I was never going to leave United Aircraft. I was doing personnel and administrative work for them. And in the summer of '67, a guy you may remember—Pete Buttner from the Dean’s Office—put in a word about me at MIT. Buttner had wanted to work in admissions work in the Educational Council. He and I had been roommates as sophomores. If you remember, he was a really small guy, and I’m not a small guy.

It’s like Mutt and Jeff.

Exactly. And one of the things he said was, “Well, if you don’t want to hire me, you need somebody. If you think I’m not the right guy, go find somebody entirely different—go talk to Hecht.” I actually spent a couple of weeks here, in the summer of '67, recruiting in Boston for United. I got recruited by Roland Greeley in the Admissions Office to come and work in Admissions as an assistant director and also the number two guy in the Educational Council.

That was the same fall and winter that the faculty committee actually first said, “You know, there’s got to be something screwy about the system here. We have one or two black kids every one or two years, and that’s it. You sort of scratch your head and say, this can’t be real—we must not be recognizing something.” We coopered up a program, sort of a really half-baked program, which we gave the unfortunate title of Project Epsilon. This was before Interphase, the before Interphase title. Pete Richardson came up with the term,

largely because of the calculus term—you know, epsilon, the little difference, we were going to make just a little difference. We recruited, I think it might have been six black kids—or five black kids and an American Indian—that year. I remember the Admissions Office being so worried about it that I actually interviewed three of those kids after they were admitted, and said, “Look, we want you to come. On the other hand, this is going to be a very different experience for you. I’m not trying to scare you away—I really want you here—but we just didn’t think it would be moral or reasonable to have this letter come down and say, you know, everything’s fine.”

We had them in the summer program. I can only remember three of the names. There was an American Indian named Richard Spang, and two blacks—Fred Johnson and Rich Prather. Those are the three guys I remember. There were three other people, no women. We ran this kind of ad hoc program with a couple of faculty members. I think Alan Lazarus might have been involved in it, although I’m not sure about that. He may have come a couple of summers later. We tried to do a little bit of calculus, a little bit of physics, a little bit of making sure people were prepared.

Then, of course, in the fall of ’68 we really started getting serious about the thing and putting a recruiting program together. We had a lot of help and a lot of pushing from people like Shirley Jackson, who pushed like hell in her shy, retiring way. So it was a really interesting time. That gradually grew into Interphase and the whole summer program. It was a remarkable set of experiences.

And, of course, that time was also the crazy times. We had unbelievably weird things go on, on campus, in terms of occupying Howard Johnson’s office and Jerry Wiesner being provost and having faculty meetings in Kresge with four, five, or six hundred faculty members—standing between the Cambridge tactical police, the dogs, and the kids. It was an absolutely unbelievable time. And at the same time, MIT was not only undergoing all this sort of social changing with the war, but also the whole set of social changes aimed at really becoming a much more open, more diverse place.

So you were in the Admissions Office when all of you recruited John Mims.

Yes, we recruited John. John was a good old colleague of mine. He and I got pretty tight in more ways than one, actually, a couple of times. I stayed

in Admissions until probably the spring of ’75, and then the year of ’75–’76 I took leave and was a Sloan Fellow.

Then I left MIT. I left MIT in September of ’76 and came back four years later, in ’80. In ’76, I went to work for a company called Waters Associates. It was kind of one of those interesting MIT connections. There was a bunch of MIT guys running a company and they were looking for somebody. We had a long conversation and I said no, and they came back and said, “Come on!” To make a long story short, I left for four years and frankly never expected I would come back to MIT.

I think by early 1980 Paul Gray had been named president. I think he had been actually named in January, or something like that. He and I were old friends. We got very close. When he was a young assistant dean, we worked together in admissions areas. Paul focused a lot of time and energy on that. Then he became chancellor, Jerry’s chancellor, and I spent a fair amount of time with him in those days.

To make a long story short, a search committee came after me—really through an old friend, another MIT guy. But frankly, in January of ’80, I couldn’t see myself coming back here. It just didn’t make any sense to me. I suppose it was the right thing to do. The search committee pushed me to have a couple of breakfast meetings with them and said, “Tell us what you think,” and I did. I figured, “They’re never going to talk to me again because I told them the truth.” I had some not very nice things to say about the Alumni Association. I didn’t think it was particularly open to young alumni, never mind minorities and women. I just thought it was kind of a looking-backwards, old-boys’ shop.

I had seen some of it when I was running the Educational Council. The Council, of course, although they used alumni volunteers, basically was run out of the Admissions Office. Anyway, I made a couple of silly demands and they met a couple of them—didn’t meet them all—and the next thing I knew, I was sitting there with an offer in my hand, saying, “What am I going to do?” I talked to Paul a little bit and decided, “Well, I’ll give it five years.” I think I committed to doing it for at least five years, and that was nineteen years ago. So I’ve either lost my capacity to count, or something.

Paul was class of '54. Was he a faculty member when you were a student?

He must have been a junior faculty member when I was a student. I never had him as an instructor. He must have been a junior faculty member, because I remember I've seen pictures of him and Doc Edgerton in the late '50s, and Paul must have been just a brand-new-minted Ph.D. He was away in '55 and '56, in the Army. Then he came back and finished his Ph.D.

Who would you say were your role models and mentors in your studies and subsequent career?

There were a couple of guys. They're both long dead now, but one guy was the fellow who ran Course XV's undergraduate program, a guy by the name of Houlder Hudgins. He had been an executive for much of his life and was recruited by Penn Brooks, the old dean at Sloan, to come back and kind of run the undergraduate program. This guy was a really fascinating man. He was a very ethical, very interesting character who had a marvelous collection of war stories. That was always fun, but in fact he was a very demanding faculty member. He would start you with a thirty-page paper and you had to do a one-page synopsis of it. That's hard, but literally by the end of the term, he'd have you reading a novel—a 300-page novel—and you had to hand him a one-page synopsis. It was this whole idea that no executive is ever going to read anything on the second page, so you'd better get really good at writing quick and to the point—what's the object, and so on.

He also was a guy I got to spend some time with. A long, long time ago, there used to be a secret society at MIT called Osiris. It was a very interesting society—very egalitarian for a secret society, in that the outgoing senior class elected five, six, or seven juniors, and those juniors in their senior year picked another bunch of seniors. They also selected faculty members to become part of the group. What was amazing about it was that there was a lot of stuffy, old-boys' stuff about it, inevitably: this is Boston, after all, and it was the '50s. But we literally had private meetings with guys like Killian. Everybody went by their first name—it wasn't Dr. Killian and Mr. Hecht, it was Jim and Bill. It was an attempt on the part of the Institute to level the playing field to some degree between students and faculty and administration, and to have candid conversation.

There were some fairly rigidly applied rules. Nobody ever quoted anything that was said in one of those meetings. You literally walked out of the meeting and you exchanged information, but you weren't at liberty to say, "Well, Killian thinks ...". But it did help you think about somebody else's point of view in a private way. The problem in public discourse, as we all know, is that people have to posture. You've got a bunch of your friends sitting around watching, and they're going to say, "Well, gee, if Clarence gets up and says this, is he going to represent the right position, or is he going to cave in?" What you do in a private conversation is that you can be candid, but you can also say, "Well, I didn't understand that, didn't understand your point of view." So it was a very interesting kind of exchange. I met a fair number of faculty through this. It was really a privilege, a rare privilege.

There were some obvious candidates for the group. There was usually the guy who was the head of *The Tech* and there was usually the UA president. In those days, we had a simpler undergraduate organization. But there frequently were people who were just interesting guys, who actually contributed, whether they were an athlete or a scholar, to the life of the place. There were people you wouldn't know from Adam, except that when you went to the department of electrical engineering, they'd say, "Boy, he's one of the brightest guys we've ever seen, and he really pushes us in the right direction." Then we got an opportunity each year to pick a faculty member or two as an honorary member of the society.

What ended up happening is that it was a meeting ground for faculty and administration and undergraduate students. It had some funny rules. There were very few women at MIT, therefore there were no women in this group. We met in interesting places like clubs on Beacon Hill that were "men-only" anyway. But it was a very interesting kind of thing that introduced me, at a reasonably young age, to some fairly powerful people in some very informal circumstances.

Then there was a guy who lived in Burton House—actually, one of the first housemasters, a fellow named Howard Bartlett. He and his wife had to be in their sixties, probably my age now. Of course, they looked ancient when you were twenty. He was a very interesting character—a Dartmouth grad, very tough-minded, no non-

sense. You didn't have to agree with him, but he was going to let you know what he thought. You didn't have to like it, but that wasn't his problem, okay? He only had a problem if he couldn't say exactly what he thought. He was very direct. We had a pretty elaborate student government at the time. In fact, Allan Bufferd and I lived in Burton House together and knew each other—not intimately well, but certainly knew each other.

So those two guys were really quite influential, Hudgins and Bartlett, in a variety of ways—helpful, supportive, demanding, really very good role models. But interestingly enough, there was also a guy who was one of the worst people I ever worked for. That time at United Aircraft I worked for a man who was a liar, a cheat, a total Teflon guy. If anything wrong happened, you did it and he didn't. Eventually, several years after I left, he got fired for embezzlement or something. He was the worst boss I ever worked for, but I actually learned a tremendous amount from him. I really learned how absolutely miserable a human being can be and how bad it is, how tough it is to work for someone like that. I had a family by that time; we had a house and a mortgage. You sort of say, "I'm not going to do anything unethical, I'm not going to do anything incorrect, but I've still got to live with this son of a bitch." How do you do that? Well, you suck up your socks and do it.

Then I came here and actually learned a lot from Rollie Greeley, whom you probably remember as director of admissions. Rollie always was a very philosophical person. He had an interesting family history. He was a Greeley of the Horace Greeley clan, a real old Yankee and a good Unitarian and all those kinds of things. He was bright as a bean, and had had an accomplished career as a city planner—Adams, Greeley and Kram, I think, but I'm not sure, the city planning firm. Then he was director of admissions, and just an interesting character—good guy. He really put a lot of responsibility on young people. He worked a lot with Paul. Paul and I were almost in parallel roles, although he was obviously a much more senior guy, and the truth is we were more colleagues. There wasn't much of a mentoring relationship there.

The other guy I always admired, and really grew to have enormous respect and affection for, was Jerry Wiesner. He was another guy who would tell you what he thought exactly, and would

get in your face. If you disagreed with him, he'd get in your face. On the other hand, he was also one of those guys who, if you got in his face, it was okay. You could disagree, and you could agree to disagree. He was very honest, a brutally honest kind of man, and deeply caring.

So I had some really good role models. I'm not sure I ever had anybody I would call a mentor, but I had an opportunity to see these guys in very tough circumstances. The early '70s around here were tough circumstances, and I saw men ten, fifteen, or twenty years my senior tested in tough ways. They weren't battlefield conditions, but they were pretty close for civilian life. These guys had tough, tough decisions to make. They had to do the right thing, and in many cases it wasn't at all clear what the right thing was. I can remember a lot of flak that we took in Admissions for recruiting minority kids. But I think there was a sense that it was the right thing to do, and you had to come to one or two conclusions about this—there's something busted in the system or the rednecks in the world were right. We all knew the rednecks in the world weren't right, so there had to be something busted in the system and you had to just do the right thing.

I think that's one of the beauties of MIT. There have been several things that happened in the '70s, even in the '90s, that showed the kind of integrity that MIT has. We really sort of set the pace.

I think that was one area. The other interesting thing to me is the way they handled the war disruption stuff. I think those were both issues on which the Institute could have said, "We'll wait till somebody else takes the lead." And MIT actually sucked up its socks, looked at itself, and said, "You know, some of the stuff's right and some of it's wrong, and if it's wrong we ought not do it." I always admired the leadership for that. It was a really kind of gritty approach—no tap dancing, let's look it square in the eyeball. They were all really straightforward, honest men—brutally honest with themselves, no pretense, zero bullshit. There's no bullshit in any of those guys. They are who they are.

When you reflect on your earliest memories of contact with blacks, has there been any evolution of your viewpoints about racial attitudes and civil rights?

Oh yes, a tremendous amount. You can't grow up in New York City and not have racial contacts,

but I think there's no question that when I was a kid, I had very few racial contacts. I lived in a white suburb. It was Queens, but it was in New York. There was early white flight. My dad grew up on St. Ann's Avenue in the Bronx, which became a part of the South Bronx black ghetto. He lived in Harlem before it was a black or a Spanish community. He wasn't particularly enlightened in his own view of blacks at all. That always bothered me, I think. I've tried to figure that out. It was funny, because it was one of the few places he wasn't a fair man. My father was painfully fair. He really believed that things should come out in a just way. But when it came to race, he wasn't fair. He had some very strong preconceived ideas. He grew up in New York City in the '10s and '20s.

I think the big evolution for me started probably when I went to Stuyvesant. It probably even started earlier than that, because I had a number of teachers—New York City public school teachers—who were black and who were fine teachers. This idea that they were black didn't matter—"I mean, so what? The person is a fine teacher, who cares? I don't care if they're pink, purple, or yellow." It was an interesting issue, because I think it was the first time—and I can't remember whether she was a third- or fourth-grade teacher of mine—that I had a teacher who wasn't a white person. The truth is, I sort of saw her as a teacher. That was very simpleminded. Those were simpler days, right? You went to school, you'd better behave—there's God, there's the teacher, there's death on the other side, and you want to avoid that.

I think the other thing that happened is I went to Stuyvesant. There weren't a lot of blacks, but there were a reasonable number of very gifted black kids at Stuyvesant even in the '50s. At that time New York had probably eight or nine hundred thousand black folk. And you would have to confront the issue, how come only two percent of the high school is black? Yet these kids were marvelously competitive, ended up being quite successful academically and quite successful in a whole bunch of other ways.

Then I came to Boston, and Boston felt very provincial in some ways. I loved MIT, but I'm sure that part of it is that everybody who comes from New York City is really like the French who live in Paris—there's only one place. But Boston did feel a lot more like a small town. Then I went to

work back in the phone company in New York and had lots of contact, particularly with the Hispanic community and the black community in Flatbush. I worked in Flatbush, Brooklyn, and I had some clients up in the Bronx, so I had a lot more contact. Then I escaped again and went to the defense industry in Hartford, Connecticut. In the '60s, Hartford did not have a black population, or, I should say, only a very tiny black population. It changed pretty dramatically. The Hispanic influx is much later than that. But in those days Hartford was almost a lily-white city. New Haven wasn't, but Hartford didn't have a big black population. And there were very few minority engineers in the defense industry at all. Then I came back here, and we went through that whole period of questioning about what's what.

So I think I've gone through a number of phases of questioning, of changing my own attitude. I guess I would have started with a fairly simpleminded model. Both my grandparents are immigrants. My father's father fled Germany during the Prussian consolidation, and my mother's father worked as a coal miner—he was a Slovak, came from Central Europe, was probably brought over here, and was a strike breaker, although he didn't know it, and turned into a wonderful union guy. I think the naive model I started out with was, "Well, look, my two grandparents came over here, essentially penniless, and made something of themselves. Why can't anybody else?"

I think what I learned over time is that it isn't that simple, culturally, and that there are realities of race and ethnicity that you have to look at. The truth is, some of that is present for some parts of the impoverished group of whites in the United States. But if you are lucky and you have money, or you can escape your circumstances, and you're not a minority person in this country, nobody can tell that you were poor or that you started out in mean circumstances. You have money and you have success and everything's fine. But the truth is, it's inescapable if you're Chinese or Korean or Vietnamese or black or Hispanic. Those things are part of your culture, and they're with you. And unfortunately, the naive view I had as a kid just isn't that simple.

So I think I learned a lot about it. I learned to confront my own sense of—how open is this country, how open should it be, and how do you get there? I guess the biggest learning experience

I've had is an interesting one. I was thinking not long ago that I probably would have guessed, in 1968 and '69, that all we had to do was do the right thing for a few years, maybe a generation, and the whole issue of race in the United States would go away—it would be fixed. And it hasn't been fixed. It's a much more complicated, much less tractable, and much harder to talk about kind of problem.

John Mims and I used to have wonderful, very candid, direct conversations about that set of issues. I learned an enormous amount from John about that. I think, for a whole bunch of reasons, John led me inside parts of his head. It was a very powerful, disturbing experience—a difficult experience, but a really good learning experience in the sense of understanding what his anxieties and fears and motivations were. And then I had to be smart enough, I guess, not to try to generalize that everybody was like that, but to say, "Holy cow, I can't imagine thinking like that." I couldn't imagine thinking like that because I just couldn't imagine it.

It wasn't just the fact that he was a different human being than I was; it was that, being black, he had a different set of struggles, period. Some of those struggles were bound to be there for everybody who was black or who was a minority. It was a very different kind of issue than for my grandchildren, who don't even know who the heck they are in terms of ethnicity. They are such a polyglot mixture—who could tell, and who cares? But that's not true for the grandchildren of a black family. They're black. Some people will react to that in a negative way and some people will stigmatize or will behave weirdly. That's a hell of a burden.

I don't think I really realized how tough it was until the first time I went to Tokyo. I was on a Tokyo subway and realized that a lot of people were staring at me. The answer was, they were staring at me because I wasn't Japanese. That's a tiny little example of a whole series of learning experiences for me.

You can almost feel that people are watching you, and they are.

That's right. I went from the airport to downtown by train, and it wasn't until I got on the subway that I felt it. There is a reasonable mix of people coming from the airport—businessmen and non-

Japanese—but the minute you get on the subway, it's a Japanese subway in a Japanese city with Japanese signs and Japanese writing, and you stick out like a sore thumb.

I don't kid myself in saying I understand, but I have some glimpses that people have been willing to share with me. I think I learned a lot from Fred Johnson and from Rich Prather, from some of the students and advisees I had. Not always. The truth is, for somebody to let you inside themselves is very personal. It only works when it works, and you can't force it. But I learned a lot.

When you came into this major position at the time you did, how did the workforce look, relative to race?

I think there was literally only one black person on the whole Alumni Association staff, a woman who had been born and raised in Cambridge and worked in the records operation. I can see her face, but I couldn't grab her name if you shot me. She had been a long time staff member, part of that local Cambridge black community that had always worked at Harvard and MIT.

It was also very clearly an organization that was largely male. There were some women beginning to move into the professional ranks, but the men were the professionals and the women were the support staff. Over the twenty years or so, a whole bunch of things have gone on. One, we've gotten a hell of a lot more ethnically diverse. We pushed that, and yet at times it has felt God-awfully hard to have it happen. But we pushed that one. I've had a really wonderful privilege in a handful of ways with a couple of black colleagues of mine, guys I hired.

There was Larry Milan, who still comes to visit me now and again and is a man I just think the world of. I think this is a guy who had an opportunity to straighten himself out and did—and, by God, my hat's off to anybody who does that. I don't know of any human being who hasn't made mistakes, maybe Paul Gray. But most of the rest of us have made some really bad mistakes, and usually sort of escaped the consequences of those mistakes because you didn't get caught, or it happened in a way in which it didn't blow up in your face, or you could sort of slide by it. And God bless Larry's heart, he just turned himself around. I think one of the best investments of time and energy I ever made was in that guy's situation.

Larry and I talk a lot about you. I've never in my twenty-seven years here seen a supervisor support and work with a person the way you did with Larry.

I just respected his willingness to try to deal with it.

Then we got really lucky when we hired Nels Armstrong for awhile. Nels worked with us. And again, he was a man whom I grew to have a very deep sense of respect and affection for. There's no other way to describe it. I'd say that he and John Mims are guys I really loved. I don't want to make a contrast. It's not that I don't respect Larry and like him a lot, I do—but I really loved Nels Armstrong and John Mims. We're all three so *shy*, and so *small*!

All three of you are so much alike.

That's right, carbon copies—slightly different colors, but carbon copies. There's a funny story about Nels, the first time Nels and I went to an Ivy League meeting together. This was when Nels was not the director of alumni affairs, he was working in the Annual Fund. We were in a meeting room and Nels does this thing—he comes in and he's kissing all the women. I looked at him and said, “Nels, how come you're kissing all the women and you're not kissing me?” He looked at me and I went over and gave him a big kiss. Well, since those days, Nels and I do that. We tear up the Ivy League. We come into a room, right? Can you imagine the guys at Dartmouth? These two big guys, both look like ex-linemen, grab each other, do the bear hug, and give a big kiss. He refers to me as his father—“That's my father.” And I say, “That's Nels, my oldest son.” So we have a great relationship, and it's been a great learning experience.

I think the other thing that was important to me about this is that, again, it was an opportunity to see somebody grow. I really enjoy that. I enjoy seeing people I can have some effect on in some way. I recognize you can't do that for everybody. You can try to do it for everybody, your aspiration ought to be to do it for everybody, but the truth is, there are some really good people for whom the chemistry doesn't work, or what they need you can't supply, what they have you can't use effectively, and those kinds of things. But those are three guys I remember very, very fondly.

They're very special folks, and all of you remind me of each other. What about mentoring that goes on within the ranks of the administrative staff?

I have some sense of it, and I guess the thing I've observed is that mentoring itself—to do it well—is hard, because in a sense it requires two things. First, it requires mutual trust. You can't really mentor somebody who won't let their guard down and you've got to be willing, as a boss, if you're the boss in that situation or the more senior person, to let your guard down. That takes a lot of trust. I think the second issue is one of the funny things about MIT that I think is not a good funny thing, I think there's a lot of great funny things about MIT, but I honestly don't think, institutionally, we have sort of stepped back and said we value good management. We're clearly bad on bad management. If you screw up a lot of shit, we're going to deal with you. But there doesn't seem to be any recognition that people who mentor, people who do those kinds of things, are important to the system. I think there's a tendency, therefore, for faculty members to mentor students and for senior faculty to sometimes mentor junior faculty, but I don't think the model carries over very well into the administrative side.

What I think happens is that it then becomes a double bind for both women and minorities, because it is harder. One of the things that has been a challenge to me, and I don't think I'm wrong here, is that it was easier for me—of course, it may be that a Milan or a Mims or an Armstrong are very special people, and they are—to mentor those guys than it is to mentor some of the women who work for me right now, because the gender issue is just different enough. But I think around here, I do notice that, with a couple of exceptions, there isn't the kind of mentoring of women and minorities that ought to be going on. I don't think it's a value we emphasize. I don't think we've somehow absorbed it in the culture well.

It's tough administratively. Yes, I'm getting older, so I'm tired, but I think this place is a hell of a lot busier than it used to be. It's not that it was ever unbusy. But the whole idea that you ought to take time once or twice a month to take some younger person out to lunch and say—“How's it going, what's happening?”—just doesn't happen as often as I think it used to happen. I think part of it is that we're busy and we're short of staff. There's more on everybody's plate. But there's also, I think, this missing value there somehow.

I look to guys who I think do pretty good jobs of mentoring. Gray is a good mentor. I was not fortunate enough to have him as a mentor, but I got to watch him a lot. Hell, I was forty when I took this job, so I came in at a fairly senior position at a relatively young age, and I got to see a lot of very senior guys. I guess they allowed me the flexibility to do what I do, I allowed them the flexibility to do what they do, and we respected each other for it. But there certainly, in the last generation or so, hasn't been the encouragement to mentor as much. You begin to sound like an old guy—I mean, shit, my next birthday I'm going to be sixty years old, so I am not a chicken anymore. But it seems to me that a decade ago there was a real encouragement on the part of senior folks in the administration to do more mentoring. It was harder, because we didn't have as many blacks and women in senior middle positions, but the handful of people who were here actually got some attention.

I think what's happened is that time seems to have compressed and everybody's got more on their plate. Again, I think there's value in mentoring. I think it's desperately important, because I think that's how you really learn how things get done. It seems to me you only learn things two ways—one of them is by having a boss who will enable you to take some risks and then, if you fail, not shoot you down but use it as a teaching opportunity; and the other one, it seems to me, is by having a mentor who's willing, maybe not in a formal way but at least in a pretty regular way, to just check up to see how you're doing and be there, available to listen to you, and if you need some counsel or advice, somebody you can go to and, as they would say in the military, take the bars off and just have a conversation.

It's frustrating to me, personally, because I've been a vice president for nineteen years now. So, have I done something different? I don't know. I think if there's anything different that I've noticed, it's that my schedule is fuller, and it's just harder to say to Mary or Sam or George that on Tuesday we're going to just do lunch and sit and not have a conversation about business, but have a conversation about life. I think a big piece of it is that there's more on my plate.

I think the other piece of it is that it's easier to romanticize the old days. But I think of Jerry. Jerry was a guy who used to spend a fair amount of time,

when he was president, wandering around the place. I think of Paul. Paul used to wander around—not just at seven o'clock in the morning, when he'd walk from the president's house, but he wandered around. You could run into him in the halls, and there was this sense that there was a value to that.

Frankly, that is one of the major pieces that has made this place so different from other places.

I think you're right. I think the values get transmitted to people in very informal ways. Sure, they very much get transmitted under times of great stress when you see somebody like a Jerry or a Howard or a Paul doing the right thing, at some substantial personal cost to them. You know this is not fun; this is hard work, and they are putting their shoulder to the wheel and doing the right thing.

But I think the other piece is that I really think this place, at its best, takes time for people, makes time for people. You almost feel as if people just keep squeezing out the time, as opposed to saying, "Look, one of your principal jobs is to make that time happen."

I have this theory I'm going to talk a little bit about. I call a lot of you "the MIT gatekeepers." These are the people who kind of set the stage, and everybody takes their cues from these people, particularly as it relates to women and minorities. You can almost pinpoint people who are either on committees doing very powerful work, or are doing things that are really more a voluntary type of thing. It's their heart, not their mind. That group of people, in my opinion, are actually at an age where they're not far from either leaving or retirement or moving into the background. The problem is that you don't see replacements for people like that, really.

I think you're right. Vannevar Bush used to say that it certainly can't be the buildings at MIT, it's got to be the people. I think it is the people, and it's a bunch of pieces. It's to some degree integrity, and I feel funny saying that—you hate to sort of say, "I'm a guy with integrity." But the truth is, I learned a long time ago that you either have it or you don't. You don't have a little bit of it—you either have it or you don't. It's kind of like oxygen, it's either there or it's not.

I think you've hit it, in terms of this sense of caring, this sense that this is my place. This is not just somebody else's place and I work here—this is my place and I'm responsible for it. It's not enough

to just say I do a good job and I give a fair day's work for a fair day's pay. That's just like, so what? That's only the beginning. I think to myself about this committee I'm almost finished chairing. Why did I spend eleven months doing this? Because it matters. I was able to convince three good faculty members, a dean, a couple of random alumni, and four students to join me on this project. It mattered to all of us. We put in a tremendous amount of work.

I think you're right. I suppose it always worries people our age, but to some degree you sort of wonder about who's going to keep the flame burning, who's going to say this place really matters and what matters about it is its willingness to kind of not just go along, but to sort of say, "Look, this counts."

I think one of the other interesting watersheds was that lawsuit we won. I think about that financial aid lawsuit. That took guts—it took balls, in plain English. It would have been so easy at a whole bunch of points to say, "Well, you know, we could back off a little bit." But it's just not the way we are. We're fierce. If we think we're right, we're fierce. And if you prove us wrong, we'll try to fix it.

It does concern me, because I think you've got to have people who care about an institution. I don't know, quite, what the competency is that you do interviewing for that says, "This person cares deeply about the place." I know you don't have to grow up in it to do that. I think certainly Mims and Milan and Armstrong didn't grow up in this place, but they cared deeply. Joe Collins has a wonderful expression, "That guy bleeds cardinal and gray." Those guys bleed cardinal and gray. They care about this place. They didn't just grow here, they gave back.

I guess that's the other issue. I guess if I go back to this old Osiris thing, that's what I saw a bunch of these characters doing. A bunch of these older men were willing to say, "It's not just enough to be a good teacher here and to be a good researcher. I've got to give back something else." At our best, that's what we do. It's the crazy Woodie Flowerses of the world who say "Why not?" instead of "Well, why should I?"—who say, "I don't understand this, but it looks dumb to me, so let's try and fix it." Thankfully, there are a bunch of people still on the faculty who think that way. I think it's tougher in the administration.

If you had to give advice to a student of color coming to MIT, what kind of advice would you give him or her?

I guess I would say two things. One, I would give my standard advice, which is to find out something you really enjoy, because I think if you enjoy it you're going to be pretty good at it, or maybe exceptionally good at it, and do as much of that as you can. I think the other one, which is a tough one, is to find somebody you can connect to who's an adult. I think what a lot of our kids do—and I think it is harder, much harder for minority kids—is that they do a doggone good job of connecting with each other, but for a whole variety of reasons they don't try to reach out and connect with an adult here.

I think that when I look at all the things I've learned, there are only two things. They were either because a peer of mine—a fellow student, a colleague on the staff, coworker—sort of hit me up upside the head and said, "Look at it this way," or I got somebody older I could respect enough to say, "Well, gee, I never thought about that," or "I didn't understand that," or "I didn't see the variety in that situation," or "I didn't understand that this little violation turns into a big violation." So I think I would advise to try to connect with an adult. I think one of the toughest things in this community—and some of it's real, there's no question—is that there's a terrible perceived barrier between the students and the faculty, because the faculty is busy and smart. I think the faculty, if you can try to connect with them, many of them—not all of them—are really much more open to that connection.

I guess the third piece of advice I would give, and I give this to any student as well, is that this is a truly rare experience. This is probably the only time in your life, unless you stay as a faculty member, when you're ever going to be in a community of people this smart—all this smart—and you might as well take it for all it's worth. If there's a chance for you to do something and you don't go for the brass ring, you're making a mistake—whether it's, "God, I'd always like to have learned to fence, or learn to sail, or learn to do this or learn to do that," or "I've always admired this guy—he helped train the astronauts and I'd love to meet him." The answer is, if you don't go up and stick your paw in his, or go out of your way to meet him, he's not going to know you're going to want to meet him.

I think it's that extra step. The kids who I think have the best experience here are the ones who are bold enough to try that. It is tougher for a minority kid and it's tougher for a woman, because they're going to have to connect with somebody who isn't, in many cases, like that. It's always harder to connect with somebody who's less like you. But I think that's really important, because if you don't, you're missing out. This place has so much to offer, but you've got to take it. It's not just "Yeah, we package a lot of it and we give you some," but you've got to take the rest of it. The hard part is helping a student figure out which pieces to take and how not to take too much of this and too little of that.

I look at the people who have gained the most from this place. There was Rich Prather. I think his son graduated a couple of years ago. I was like, "Huh? Holy cow!" And you look at a Greg Jackson, or you look at a whole bunch of guys who really have kind of taken this place and said, "I'm going to take it for what it's worth." I think you can do that, but I don't minimize the reality of it being tougher for a minority kid—it *is* tougher. This is not yet the kind of environment that we hoped, thirty years ago, it would be.

Why do you think that's so?

Because I don't think we have enough tenured black faculty members. I don't think we have a staff that is as black and representative of the community here in Boston as it ought to be. I think that makes it harder. I remember being with John Mims when John would say, "You know, I'm one of the ten guys here—me and Clarence and we can name the eight other people. If we don't give, there's going to be a group of kids who won't have an opportunity to have a connection."

We've had some really terrific, outstanding students who have graduated from here, and at least about fifty per cent have been black. When I look at our faculty, and I look at the fact that at one point almost fifty percent of them had gotten at least one degree from MIT, we have had all of the opportunities to have all these bright black kids come here and we haven't been able to take advantage of that for faculty positions. Is there something I'm missing on that?

There is something missing. I wish to hell I understood it, because I think it's this issue of people—the faculty—not taking the extra step early enough. Most faculty members, let's face it, are

awful damn bright. They're in the one percentile. I think most of them, very early on in their academic career, realized they were really quite smart and could do all this stuff. It never dawned on them that they wouldn't just keep doing it. It never dawned on them that they needed somebody to tell them to keep doing it. I think we don't do that very well for people who are just as bright as the faculty, but for whom it isn't obvious that they could do this, do it as a faculty member, and it's a hell of a good thing to do.

I think back to a number of kids I've seen who were really awful damn bright. I'm not sure anybody got to them in their junior year and said, "You've just got to keep driving. If you do it, then you'll be fine, and you can do it just as easily as I can." I think it's part of that barrier. It's that the faculty doesn't understand that you really need to reach out to somebody and say, "You've got to do this."

I've been lucky all my life. I'd love to say it was all talent. Some of it is talent, but some of it's luck. At a whole bunch of points in time somebody reached out and either aimed me in a direction or was willing to say, "Try this," or, "Don't be shy about that." I think we haven't made that kind of outreach. I think it's a kind of blindness. I suspect most of these faculty members, on this faculty anyway, have never from the time they were seventeen or eighteen had a self-doubting moment at all. They just didn't. It all started to click, and it was like whiz. They may have had self-doubts about the rest of their lives—marriage, relationships, children, grandchildren, you name it—but when it came to academics, they never had a self-doubt. I think they don't understand that a whole bunch of people who aren't white and who are just as smart as they are, or who are women and just as smart as they are, need a little bit of encouragement.

I really believe that. Look at the number of faculty members who will say to a student—one who doesn't come to them and say, "God, I'm thinking about becoming a graduate student"—"You ought to think about being a graduate student." I just don't hear about it. I may be missing something entirely. I'm not a faculty member and I'm not close to that kind of thing, but you don't hear about it a lot. You hear wonderful stories from faculty members who say once they stepped over the threshold and talked to a faculty member

about becoming a faculty member, it worked well. But you don't see the outreach.

I think it's exactly that kind of personal outreach that's so important. I think to myself, in those three strong relationships I built with black guys, what was it that worked? It was my willingness to be open and reach out. And they reciprocated. I've had relationships where it didn't work, but those guys reciprocated. That's how you get to have a relationship. The truth is, I think if you don't reach out, it doesn't happen.

What we have had here—and still have—is a golden opportunity that no other university or college has. We know how to select people. That's one thing that is very clear.

There's absolutely no question we know how to select them.

We know those who fit us.

That's right. We do, in general, a much better job of educating students than most other places do. In a sense, it's wrapped up in this residence stuff to some degree. Our kids believe—and they kept beating us on the head about this—that it's only when somebody extends a personal interest in you, and it's not organized, that it matters. I kept saying back to them, "Well look, the trouble is you've got to organize it in the first place, in order to get somebody to know you well enough to know that you care about them, even though it's an official thing." If you go back to the days before associate advisors, there was a hell a lot of advice being given by upperclassmen—some of it good, some of it bad. But now suddenly, since we've institutionalized it, I think we give much better advice here.

I don't think, and I may be dead wrong, that there's any more profound sort of racial lockout on this faculty than there is in any other faculty in the United States. It's there, but it's no different here than it is in any place else. I think it's the simple issue of faculty members not understanding what a profound effect they can have on a young person, by just doing a little reaching out.

It's a really funny kind of phenomenon. I think what you're doing is, in effect, reinforcing a kind of unfair system that, for the kid who sort of grows up in a faculty surrounding—both parents have Ph.D's—the expectation is, "Well, what the hell else will I do?" But if you don't come from there, you need a different push. Let's face it, most

of our black kids don't come from there. They come from middle-class black families, but not usually two-professional families and certainly not from families with science and technology in their background. They're just as weird as all the other kids, because they've got science and technology stars. But you just need to encourage that, and if you don't encourage that, it's not fair.

BAMIT has done a pretty good job—not always, but sometimes—of trying to mentor kids and do things to reach out. But how many BAMIT alumni are faculty members? Very few.

Is there anything else you'd like to say about racial issues?

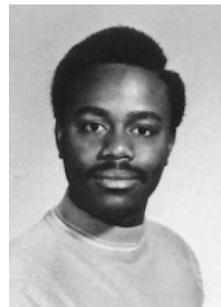

I still think we need to do more all over the place, and I think the best places still have the biggest responsibility. I really do believe that we still don't make it easy for men and women to talk about these kinds of issues. It's never going to be easy to talk about these issues, but it's important to try to establish ways in which people could encounter and be intimate and be connected and in a sense feel safe enough to say some things that we need to talk about. It's a damn tough set of issues, but I think the responsibility is ours.

I think it's a very different order of responsibility than where we were twenty-five or thirty years ago. Twenty-five or thirty years ago we solved problems that were relatively easy to deal with. They were not trivial, and it took a lot of courage on the part of this place to do that. But I think the next set of problems is even more challenging and more difficult, in the sense that they require us to sort of share little pieces of each other's personal stuff. That's hard.

And yet, I don't really think the promise of our society is ever going to get there unless people do that. I think we're missing a kind of richness about ourselves. It's complicated and it's hard and it's not all lovely and wonderful, but I think we're missing this kind of opportunity. There aren't a hell of a lot of societies in the world that have that opportunity. We're blessed in a whole bunch of ways—a reasonably strong economy, reasonable laws—to the degree that they're reasonable, the laws are quite reasonable in this society—and our aspirations are pretty high. But fulfilling those aspirations takes a lot of work.

SEKAZI K. MTINGWA

b. 1949, SB 1971 (physics) and SB 1971 (mathematics) MIT, MA 1976 and PhD 1976 (physics) Princeton University; research scientist, Fermi National Accelerator Laboratory, 1980-1988, and Argonne National Laboratory, 1988-1991; professor of physics, North Carolina A&T State University, 1991- ; chair, Department of Physics, 1991-1994, and first director of physics graduate program, 1996-1997; J. Ernest Wilkins Jr. Distinguished Professor of Physics, Morgan State University, 1997- ; member, MIT Corporation, 1971-1975; president and board chair, National Society of Black Physicists, 1992-1994.

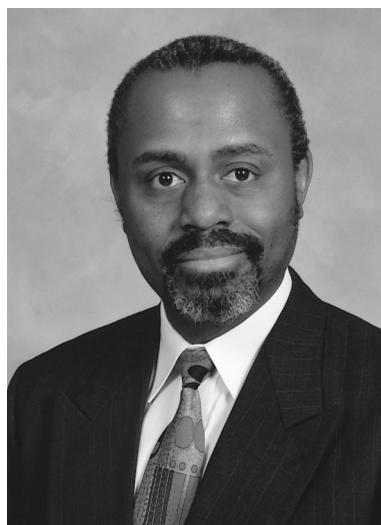

I grew up in Atlanta, Georgia, and in fact never left the state of Georgia until I went to MIT back in '67. I grew up in Atlanta during the time of segregation, of course. In fact, I don't think they integrated the schools until I was in about the tenth grade. Although it was done more or less legally it never really happened, so it took a while. Basically the schools were segregated when I was growing up, but I think we had teachers who were able to do a fantastic job in spite of the fact that we got used textbooks, in many cases the worst facilities. In fact, I remember we were so happy when we got a new gym. We thought it was the greatest thing in the world until we saw the facilities at one of the white schools. I was in the band and I was in one of these types of all-city bands or all-state, I don't remember which, but I went out to one of the predominantly or essentially white high schools and their gym was *much* better than ours. So that was one of our first experiences seeing the disparity. I don't think ever before that time I realized the disparity. Most of those things you only thought about many years later, but that struck me because we were so proud of our gym and it was far inferior to the other gym.

But anyway, I think I had excellent preparation. I had teachers who were devoted to us. In fact, I had two teachers—one in math by the name of Ms. Mary Burnside, who really pushed me in mathematics, and another teacher, named Ms. Dorothea Jackson, who taught me chemistry and physics. Ms. Jackson was also my science project advisor and she always encouraged us to work on projects. I started early on, when I was in the ninth

grade. In eighth grade, she basically took me to the science fair to see the older children and how well they did. I was inspired by that and I started working on a project in the ninth grade, and in fact in the tenth grade I was able to go. They integrated the state competition for the first time in tenth grade. I guess this went along with integrating the schools. I went down to the University of Georgia and placed first place in biology. That was one of the great days of my life. In the tenth grade, yes, that was really exciting.

Now, this was all supported by your black teachers in your all-black high school?

Right, that's correct. That, I guess, just further shows the degree of devotion, because Ms. Jackson just spent hours after school with me and the other students. She also was the Girl Scout leader, so I had a lot of Girl Scout cookies. I used to be

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with Sekazi K. Mtingwa in Greensboro, North Carolina, 27 February 1996.

hooked on Girl Scout cookies. But she just spent an incredible number of hours after school and I really appreciate what she did now that I look back. You don't have to do that, and it's rare to have a teacher who every day is after school until, you know, four, five, and six o'clock helping students work on projects and other things. She was devoted. That's the type of devotion that I felt when I was coming along.

I've had different interests at different points in my life. I remember when I was in high school, for some reason I always wanted to be a physicist. I always wanted to be one, as far back as I can remember. I don't know what sparked any of my interest in science or in physics per se, but I remember being fascinated by names like Albert Einstein. Even in elementary school I knew I wanted to, I thought I wanted to be a physicist. When I got to high school, I became interested in music more and more too, and I remember when I was finishing high school I was trying to decide if I really wanted to go into music. I was interested more and more in music composition. I wanted to be a composer, so I used to get all these books talking about the lives of Tchaikovsky and many of these famous pianists—Vladimir Horowitz and Artur Rubinstein and all of these people. But then I decided that I wanted to do something that was a little bit more real-world. But I had double interests, and it was only much later in life that I realized that science and music are not incongruous. Science is an art and it's hard to know what inspires people to come up with these ideas, just like the artists come up with their great ideas. So even though at the time I didn't understand, I think it was just the creativity that attracted me to the music.

Anyway, let me go back to the whole point of my interest in science. When I was young, my name was Michael Sawyer. In fact, I guess when you first met me it was Michael Von Sawyer. When I was in elementary school, the scientists in the books—textbooks—were like Von Neumann, you know, a lot of German-sounding names. People used to kid me that I'm going to be, you know, a scientist with these people because I'm Von Sawyer. That may have been the thing that attracted me early on to thinking about science, just by being kidded by my friends. But that's the only thing I can think of.

What about your family?

Let me give you a little bit of background about my family. My mother and father separated when I was in second grade and they got divorced soon after that. So from the second grade until the eighth grade, we went to live with our grandparents—my mother and my two brothers, one a year older than I am and one four years younger. Our mother was remarried when I was in the eighth grade. They were married for many years, although they are divorced now. But they were married through my finishing graduate school, the whole bit. My mother was a nurse. She was not a licensed practical nurse, but she was like a nurse's aide. I don't know, nowadays they may have called her nurse's aide or whatever. She worked for a private doctor, Dr. John R. Walker.

She did the same thing a nurse does, probably.

Right, right, so she did that. She completed part of her freshman year at Spelman, so she started college. In fact, she and my father were married when they were, I guess, early in their college days or something like that. She always had an appreciation, always wanted us to go to college. There was never any question about the fact she was pushing us to prepare ourselves to go to college. She wanted us to be schoolteachers or medical doctors. Those are things that people understood in the black community growing up. Scientists and all these other things was like news to her. She didn't stand against it, but it was news. I mean, then the top jobs were the high school teachers and the medical doctors. You didn't have so many lawyers at that time.

In fact, it's kind of sad because my closest friend who was a year older than I, his father was an attorney and the kids used to joke him because *Amos 'n' Andy*, remember, was on TV in those days and I guess the character's name was Calhoun. You know, the image of the black attorney was like old John C. Calhoun, whatever his name was. So being a lawyer was not desirable. It's really sad to say, but I think that that program probably discouraged a lot of youngsters from being lawyers. We just didn't imagine being a lawyer, being like that crazy guy on TV. So anyway, that's a little bit of background.

How and why did you choose your field or career? You've made some comments, but I think it's important to con-

tinue, because during the time that you came into that field it was very rare. So when you look back in terms of going into science, would you say the schoolteacher that you mentioned—Ms. Jackson, was it?

Yes, Ms. Jackson.

Would you say she was the most influential?

I can't say. To me there was no event, there was no one person, but even before I hit high school I thought I wanted to go into physics. But I don't know why. I don't remember why.

How did you decide to come to MIT as an undergraduate student?

I wanted to go to the best and as I looked around the country, MIT just struck me as being the best school to study physics and technical areas.

So you didn't meet anyone? You just read information?

Yes, I just read information. In fact, people just didn't believe it. People were more encouraging me towards Georgia Tech, since I grew up not far from Georgia Tech, within five miles of Georgia Tech. That was like the top of the hill. I don't know, I've always wanted to aspire for the absolute very best, so I wanted to transcend even Georgia Tech. When I said MIT, people didn't get it. In fact, I remember one of my counselors in high school was very concerned. I could understand her concern, you know. At the time I didn't, but now I can understand. She was concerned about my going away to MIT because it may be a little bit too much given my background. I was going to be competing against all of these kids from prep schools and the best schools in New York City and so forth. So I could understand. MIT was something that I had to just declare I was going to go to in spite of people saying, "You should really look at Georgia Tech."

My mother was always supportive, though. She said, "If you can get the scholarship, then go for it." My stepfather was more pushing towards Georgia Tech. It was no big thing, you know. He said, "If you want to go to MIT, okay." You have to understand that at that time Georgia Tech in Atlanta was as good as there is. That was top of the hill, so why go elsewhere when you have it right here? And it's a lot cheaper. I think it's a state school.

When you finally decided to go, when you got to Cambridge, do you recall your early experiences and what it meant to you, particularly coming from such a long distance, from Atlanta?

Yes, it was something. I had a long train ride. My mother had never flown and she didn't want me up in the air. All that quickly changed after that one train ride. That convinced me not to go that far on trains. I think I hated trains ever since, but the thing that stuck out in my mind is that people were so nice to me. I moved into Burton House and the guys there were great. One thing that struck me from the first was, "I'm going to have to change the way I talk." See, I had never had interactions with people outside of my circle of friends and so forth, and it hit me—bam!—that I better use some grammar. The first days there I had to think. I remember I used to have to be very careful and think about conjugating verbs and things of that nature. So that was one thing that struck me.

The people were so nice to me, though. I remember that they went the extra mile to make sure that I had something to eat and the whole thing because I was new and I had arrived probably at an awkward hour. I remember people taking me to get food and so forth. People were really friendly.

Did they have that kind of housing choice situation like they do now?

Yes. Well, you could choose. In fact, I tried to choose the cheapest, which is why I was in Burton. I lived in a quad at first. We had four people. That was the absolute cheapest, as I recall, room that I could get. I was trying to cut costs, so I lived in a quad in Burton House. I had excellent roommates. They were really nice. One guy was so quiet you never knew he was there. Another guy was a diver on the diving/swim team at MIT and then the other guy was more interested in physics, like I was. But it was a good group. It was kind of hard to get along with people many times, but I think we all were able to get along very well.

Were you the only black?

Yes, the only black. I think there were about a thousand in all in that class, and I guess there were about five or six blacks—two from Georgia. One thing that struck me, most of the black students seemed to be from the South, from D.C. on down. There were two of us from Georgia, but if you look at the number of blacks that I remembered overall, there were quite a few from Georgia and other Southern states.

So after your arrival, it was really not much of an issue about what you were going to major in.

No. I knew it would be physics. But then that takes me to another quirk in my career. I also was interested in mathematics, so I double-majored in physics and pure mathematics. They had two tracks, applied and pure. I double-majored in physics and the pure mathematics track, and when I was finishing MIT I had to again make a decision—do I want to go be a physicist, theoretical physicist, or mathematician? I think physics easily sort of won out because, having been through the Vietnam War era and all of the social consciousness, I couldn't see just sitting back thinking of abstract mathematical spaces and all this stuff. I needed to do something that had some real-world applications, so that's why math lost in terms of my interest in physics.

Now, you did not go to the military?

No, I never went to the military. In fact, during the latter part of the Vietnam War, they switched over to the lottery system. I was about a junior, I guess, when we switched over to the lottery. Before then I had a student deferment. And then the lottery, my number was like 197 or something, I guess, so I was not called in that first group. I remember sitting around the night they had the first drawing. Some people's numbers were called. They were pretty sad because they had gotten rid of the deferment at that point. As a matter of fact, I remember a lot of students started running to the psychiatrist to declare they were not mentally fit to serve in that type of situation. A lot of people were. That's probably true.

Today a lot of students have difficulty in their academic work at the Institute, particularly the first year or two. What would you say about your experience in terms of being able to do the work itself—the academics, the physics, the math, and the chemistry—that you were required to take in your first year? What kind of experience did you have there in terms of being able to do the work, the academic environment with other students, and all that?

You have to work hard. Now I made all B's my first semester and it was only after that I started making A's in just about everything. So there was a transition period. But one thing, the present generation is different from ours and I'm still trying to understand them. I'm here teaching a young, much younger generation. I see students don't reach out as much. That's one thing I did. I reached out to my professors. I mean, I would go by their

offices. Things I didn't understand I would chase. I'm sure some of them were sick of seeing me. You take a quiz—I'd go to them and want to know what I did wrong and this and that. I think that's what it takes, and I think that students definitely have the abilities. It's a matter of reaching out and getting the help and not letting things just go and drag on and then at the last minute you're trying to cram and catch up. I think that's the key and I see that here. You have to constantly work at it. You can't just cram.

You have a lot of drive, I must say, because you had to do exceedingly well to be in the highest academic fraternal organization. So you had that drive early. Were the other few black students like you, would you say?

I didn't see them that much. Okay, so I think that was a transition. My junior year was when we admitted the first large class of about fifty-three. That was in '69, the fall of '69. Then the whole ball game changed, but prior to that time I think we all worked hard. We didn't see each other so much unless we went out of our way to, because the numbers were so small and we were scattered all around. I had a good friend, Bennie Ward, who stayed downstairs from me in Burton House, who's now a physicist also. He was in fact at Princeton a year ahead of me. He's at the University of Tennessee in Knoxville. He was a brilliant guy. He had some difficulties in his career after he left Princeton, though.

Oh, he went to Princeton after MIT just like you did? Yes, right. We were in the same field, in fact. He was a brilliant guy. In fact, he finished his Ph.D. at Princeton probably as fast as anybody ever did. He did his thesis in about less than a year. It was amazing to me. I remember when I arrived, his thesis advisor was on leave to Fermilab and his thesis advisor came back around January. I remember at the end of the summer I asked Bennie how was his thesis. I guess I'm saying that he didn't start his thesis research until around January. And I remember at the beginning of school around September I asked him, "How is your thesis coming?" He said, "I've finished it already." So that was in about six, seven months. He did his thesis and finished in record time. He's a brilliant guy. He's kind of quiet, kind of a loner kind of a guy, so at MIT he really didn't have any visibility. He wasn't active so much in the Black Student Union and other things like that. But he has consciousness. He knew what was

going on, but it's just that was his way. He's just a hard-working guy.

Are there any experiences or examples of people who were influential to you when you were at MIT—whether they were in the dean's office, whether they were faculty members?

Oh yes, excellent faculty members. Victor Weisskopf was somebody I always admired. He's still there, he's an emeritus professor there. In fact, he was my thesis advisor as a senior. He was very nice to me, very nice. In fact, several of the faculty... Francis Low, who's still there—I guess he's still there?

He's still there. I see him every once in a while.

He was provost. He was very nice to me. I had a lot of people. For instance, when I was a senior, I had run out of regular undergraduate courses. I had finished the undergraduate physics courses by the end of my junior year and I went to some of the professors and said that I would like to study graduate level courses as independent study. I went to see Francis Low. I knew he's a busy famous guy, but he said yes. So I studied electromagnetism under him. It was independent study.

When you say you did all this by the end of your junior year, you understand what that means, right? It means that you were very smart.

See, I was inspired by what other students were doing. I remember one guy who took tests over the summer. He would take the syllabus from the course, get the textbooks, study it over the summer, and come back and take the course and pass. So I did that a couple of times for three courses. My quantum mechanics course I did that for. I did it in linear algebra and I did it in complex function theory. So that pushed me ahead in terms of finishing earlier than usual.

As a matter of fact, I remember when I was a senior I went to see my advisor, I guess his name was Osborne, Professor Osborne. He was in plasma physics. And I said, "Look, I have enough credits to get two bachelor's degrees in physics and mathematics. Should I go on and get a master's degree?" He said, "Well, you're going to get a Ph.D. so it really doesn't matter." But I could have gotten a master's degree too if I really wanted to. And he was right. I mean, if you get a Ph.D. you're going to get a master's anyway. But I took overloads, and I warn students nowadays don't take overloads unless you're doing well in everything,

because there's always this rush to finish. I was consumed by finishing fast and taking all these courses, but it really isn't necessary and I tell students that. Luckily, I was getting A's in just about everything. But if you're not, then you don't want to do that.

What would you say was best about your experience at MIT and what would you say was worst about it? Could you elaborate a little bit about that?

The best experience, I guess, is just the academic preparation that I got. I think I had as good an academic preparation as one can get. And I had excellent relationships with just about all of my professors. I had one professor in humanities when I was a freshman—that was not a good experience, but other than that I just thought that the faculty was top-notch.

Worst experience. That's an interesting question, the worst experience... There's nothing that really stands out in my mind. Of course, I was there during the time when everybody was unhappy about everything, but I think that's all a part of growing up. I can't really say. I mean, those were great years. MIT was good, I think it was a great experience. That may not be consistent maybe with statements I've made years in the past, because I was younger and going through things and I may have been critical. I may have gone on record as being critical, but now I have a chance to look back and say, "Ah, so-and-so was right about this, about that." I'm getting old. You appreciate things. You see, I was at the reunion for the first time in twenty-four years last year.

But the thing that I think is beautiful about you is that what I think I hear you saying are stages in your life, particularly to do the significant things you've done. So when you look at the undergraduate level, what I hear you saying is basically that it was really a very positive experience. We're going to move from that in just a minute, but before we leave that college level, there are a couple of other questions I wanted to ask you. I think your career is so interesting beyond this point, so I wanted to spend some time on that. Is there any advice you might offer to other black students who would be entering MIT, based on your experiences and what you know at the present time?

Advice about MIT. I think students need to get themselves academically prepared, of course. I think they really do need to understand everything through calculus, and know it well, because you don't have time to fumble around once you get

there. Students now are much smarter than we used to be. It's kind of strange. The average proficiency has gone down tremendously, but that cream of the crop I think is much smarter than we used to be. The present cream of the crop far, far exceeds our cream of the crop.

I try to tell students if you're going to get out there and be competitive in the world—going at the best, against the best people from all over the world: Japan, Asians are just knocking the roof off of all of the academic disciplines and that's good—you have to dig in and be like them. You're going to have to be prepared and there are no shortcuts but hard work. I try to get people to turn the TV off. In fact, in my home I've had at times to hide the cable boxes. When I go to work, I go around the house and collect all the cable boxes. I tell my girls if you're going to be competitive you've got to get your act together, you've got to work hard because the competition is fierce. I've seen it and I've faced it, stared at it, created a career. I've had to struggle my way to the top in my career, and it's kind of interesting. You struggle long and hard to get these permanent staff appointments at Fermilab and at Argonne Laboratory, and then to just say, "Well, I have other things I want to do." So I just left it all. People thought I was crazy, but the point is that I was able to fight my way to the top and stare at the competition. I know what's out there, so when I'm here telling students that you need to do this and do that, that's what you need to do if you're going to be competitive.

One of the things that I'd like to mention is that languages are so important. I recognized that many years ago. When I was in about the ninth grade, I started my science project but I didn't compete in the ninth grade. I went to the Atlanta Science Congress, and there was a Georgia Tech professor who said, "If you're going to have a career in the sciences, you need to study languages. You need to study Russian, German, or French, and unfortunately it's in that order of difficulty but that same order of priority. Russian would be the most important, then German, and then French." So naturally I wanted to learn Russian. When I went to MIT I spent more time studying Russian than all my other courses combined, which is kind of strange. You went to Russian, I think, four times a week as opposed to three in your lecture courses, and just the amount of time it took to do it—the translations and all the things you had to do—was

enormous. Every night I would study Russian first and I would always end up spending at least about two hours on it. I think I spent more time on Russian than all my other courses combined, which is the weirdest thing.

Yes, but you are quite unique. In fact, one of the questions I had to ask you, you are answering now—that is, you speak Russian, Spanish, French, and Italian. I think that's quite unusual.

It's kind of a hobby. I had these hobbies. Languages are a hobby. When I come to work I always pull out a language book and learn at least one verb a day or learn something or one word. If I can just learn one thing a day, it adds up over time.

That's extraordinary.

Somehow I don't feel it's extraordinary. I'm slowly learning, maybe that's the whole thing.

That's extraordinary, being able to have that knowledge about that many languages other than your native language. Could we spend a little time on what happened after you finished? You mentioned the Fermilab, but when I look at your career you have been in a lot of places and gotten a lot of very different experiences. Here you were, you went to the University of Rochester, the University of Maryland, and even during those times you were a member of many other centers related to physics. Could you talk a little bit about what that did for you, why you did all this?

In my particular area it was normal, and in fact it still is, to have several post-docs, even before you start on your staff position or faculty position. So when I finished Princeton, I went up to the University of Rochester on a post-doc. And in fact, that's where I met my wife. She was an academic advisor there. She had been there a year before I arrived, and there was a professor there named Jesse Moore who was intent on us getting together. So he would always ask me, "Have you called her yet? Have you called her?" And I was slow, so one time he just got mad and said, "Give me your number." My wife called me and we went out to see *Carwash*. That was our first date. It's a funny movie. So one thing led to another. Rochester is always going to be dear to my heart because that's where we met and we were married.

Now, was she a student there?

No, she was an academic advisor. She had finished Connecticut College, and that's probably not far from Storrs, where you were, in New London.

Very nice little school too.

Right. It's an excellent school, beautiful campus. So anyway, I went up to Rochester and that was a good experience. I was hired by this guy named Adrian Melissinos, who was chair of the department, and he hired me to work with Dr. Okubo, who was a real famous theoretical physicist. That's how I got my start. It was a good experience. Another nice thing, Melissinos really liked me and he arranged for me to be a part-time assistant professor because he knew that would be helpful in terms of later getting faculty jobs and having teaching experience. It was a good experience for me to sort of double as a research associate and an assistant professor. Then I went to the University of Maryland.

How did you get to the University of Maryland?

Again, I went through the whole post-doc application period. You know, when you take a post-doc, it's two years in and out basically. At Rochester, I spent a year and then I started applying. I got the position at Maryland and I went down. It was a great experience. My wife went to American University and got her master's degree. Our first daughter was born in the second year when she finished her degree. So a lot of good things happened.

You stayed at the University of Maryland until when?
'Seventy-eight through '80.

Then you went to Fermilab, which is where you spent the longest period of time to that point in any one position.
Eight years, right. I went there because I received one of these Ford Foundation post-doctoral fellowships, which allows you to go for one year to someplace. I went to Fermilab with that and I stayed afterwards. I was able to get a staff appointment there. There were some good people there who helped me quite a bit. Leon Lederman, who was a Nobel Prize winner, was director of our laboratory, and he made some nice arrangements for me to stay there. One thing led to another and I stayed there for eight years as a staff physicist. In fact, one of the most important pieces of work that I did as a physicist was done with a guy named James Bjorken, who went back to Stanford University, where he had been. In fact, I guess he arrived at Fermilab about a year before I did. He had done many years at the Stanford Linear Accelerator Center. In fact, he's the one that did

the theoretical work which led to the Nobel Prize for Jerome Friedman.

Is that right?

Yes. He also is an alumnus of MIT. The two of us did this work on looking at how beams and accelerators—the protons—travel around these race-tracks and how those beams spread. You need to understand that, and that work has been extremely beneficial in terms of my career and being well known in my field. So Fermilab, working with Bjorken and the whole bit, was a great experience for me.

Let me stop a minute there and go back just a little bit, because there's a piece that we missed that I really think is important to get your feedback on. I think somewhere, either during the time you were at Fermilab or before you came there, you were on the Corporation at MIT. As I recall, you were quite outspoken at that time.

Yes, it caused me problems. In fact, you might know that I was X'd off of the Corporation.

Well, we talked. You may not remember it, but we talked during that period of time.

I remember, yes. What happened was that I spoke out about a lot of issues, black and non-black, and I was very active on visiting committees. I tried to talk a lot to the chairs of those departments. In mathematics, there was Professor Hoffman, and I don't remember the professor in humanities. I have to go back. In fact, I have a bag of letters here. I noticed that one of those envelopes is marked "part sixteen," so there must be fifteen others. I kept all of my correspondence. I remember talking about the necessity of philosophy and other humanities students having a lounge where they can come and interact. So I tried to be even-handed. In fact, I was warned by someone—probably James Bishop—to be careful because they're going to try to say, "You only talk about minority issues." I took his advice to heart and I tried to talk about a lot of issues, but I didn't back away from minority issues.

Anyway, at some point Jerome Wiesner called me and Laurence Storch, who was another representative who was called aside, and maybe there was also a woman he called aside. He told me, "You only speak on black issues," and told the other person he only spoke on this and the other one maybe only on women's issues, and so forth. I was offended because that was not true. I think the

problem I had is that I put it in writing. I went back home and it just bothered me so much that I wrote him a letter, and I copied you on the letter.

Yes, I remember.

And when I saw him the next time he had tears in his eyes, he was so angry. He came up to me and he said something. I've always liked and admired Wiesner, so this is just a personal disagreement. I still held the utmost respect for him and it was a great loss when he passed away. But I don't think he ever forgave me for putting that in writing, when I told him that that was not true, that I talked about many other issues, and so forth and so on. He told me, "You think you can just say anything?" So he was hurt and then I think I came to you. In fact, I know I saw you not long after that and you told me that the reason he was probably so upset is that I copied it to you.

Right. And also, I had written a letter to him and to Paul Gray about the lack of some things that they were not doing, and so when you copied me it simply added fuel to the fire, you see.

Oh, they were angry, really angry—so much so that Rosenblith, who was at that time the provost, I guess, refused to communicate. I mean, it was clear that he was ignoring me when I would see them and go back to meetings and so forth. It was many years later—in fact I have a letter in there right now—where somehow I was X'd off of the former Corporation list.

We should deal with that.

Well, I would like to be reinstated. I don't know if I'm still X'd off of it, but I would like to be reinstated. I don't think it's really fair that, because Wiesner did not like something I did, for people to go a step further and to X me off the list. I think what happened was that this came by accident. In fact, today I rarely get any former Corporation invitations. I remember, when I was on the Corporation, periodically they would have former members who would come back and march or participate in the meetings. And that all stopped.

Well, we should talk a little bit about how we should deal with that, but it was clear to me that at that time you were a young black scholar who spoke what you thought was fair and what you thought was true. I think we were in a stage of still trying to accept African-Americans being up-front. I think we aren't all that much better now, but I think in that particular period of time it was unusual.

That brings me to another person. When you were on the board, Jerome Holland was also there. When you hear his name, what would you think about him?

He was a dignified man. He was your typical Corporation member, though. I sort of looked at him as being—and I was a young guy at that time—a part of the establishment. He was just like the rest of them, all these rich fat cats—and here we are, irritants. But he was supportive of me. He would sort of nod and agree with what I would say about some of the issues I was dealing with. South Africa was a big issue to me because I was saying that we should not invest in companies that deal in South Africa. That was not a popular thing to say because at the time people were using the "Sullivan Principles," saying that if the companies were doing this or that, then it's okay for them to deal. And I was absolutely against it. That was well before the time when people started saying that we should pull out, so it was not a popular thing and all of these corporation presidents all sitting in there didn't want to hear that. That was an irritant, I think.

Oh, it was brave to say the least, because one has to recognize how that Corporation was structured. I mean an African-American personally being there was totally abnormal, and to be able to stand up before that whole group of CEO's of these major corporations to tell them they should get out of South Africa.

They didn't want to hear it.

Now, where do you think you paid a price for being as up-front as you were at that time? I think it was somewhere down the line, either before you went to Fermilab or after. You were always an up-front person.

It caused me problems. In fact, I had problems in graduate school because I took on issues that really bothered me in how some of the students were treated. There was a dean—I don't want to mention names, but there was an assistant dean, actually—at Princeton. I was very critical of her handling of minority students, and I remember the chair of my physics department made it clear to me in no uncertain terms that that was his neighbor, without going into any elaboration. He wanted me to know because they were controlling my degree. "That's my neighbor that you're fighting with."

But my wife is the same. We never back down from fights even under fear of losing our jobs. She's had to fight those battles in her corporation. We

talk about this. We have to live with ourselves. The houses and all that we live in, we can always get more houses if we lose our jobs. In fact, I remember my wife did lose her job in Chicago for her principles. She was assistant commissioner of economic development for the city of Chicago during the Washington era.

So she's just like you.

She's been fighting, yes. She's a real fighter. And we've looked at the situation where you refuse. They wanted her to do some things—fire some people and do some things—that weren't right, based on politics, so she had to leave her job. So we had some pretty tough years there in terms of finances.

Well, I heard about it and that's why I wanted you to talk a little bit about it. I think you deserve to be able to be on record on standing up for principles. This is one of the major problems I think we have, but you stood up for principles. I also know during that particular time, you paid a personal price. A couple of your friends conveyed that to me when you were in Chicago.

We always had problems, even at Fermilab. Like I said, Leon Lederman, who was the director of the lab there, made an opportunity for me to stay because I was very outspoken against even people in the group that I was visiting on that one-year fellowship. I was telling them that I have all the qualifications to be hired as a regular staff person in that group, and they were busy trying to demoralize me. But Leon told me something very interesting, which I try to use even now. He said that a lot of times you can't go through people, you have to go around them. So that's why he made arrangements for me to stay at the Lab in a different group and allowed other opportunities which in the end worked out the better for me anyway. That's how I got involved in doing this work with Bjorken, and this paper that we wrote is a real well-known paper in the field.

It's a classic.

Yes, it was interesting how things work out. So I even advise youngsters now to be flexible in their career because they might not be able to do what they immediately want to do. But a lot of times the thing you do when you go the other way is more beneficial to you. So it's interesting how life turns out.

And also what you're saying is that you've learned through your own experiences in terms of dealing with things that you totally disagreed with or people you disagreed with. How did you get from Fermilab to UCLA?

What happened was that at Fermilab I was a member of a center for accelerator physics. That was sort of a group of people who came together for symposia and for interactions. The person there, Dave Cline, who was a professor at Wisconsin, left and went to UCLA and he established a center there. I was a member of that center. It wasn't a staff appointment.

But the Argonne National Lab was your next appointment.

Right. When I was at Fermilab, when we finished building the big proton/antiproton collider, I had several options. I could either stay at Fermilab and just deal with upgrading the machines and all, and I didn't want to do that, or I could go to work for the SSC down in Texas, the Superconducting Supercollider. Even then I didn't think that thing was going to be built. I'm so happy that I've made the right guesses. It's amazing in hindsight to see that you made the right guesses. Even then, when everybody was so "rah, rah, rah" going forward, I never really had much confidence in it. There was something about that thing that I said I've got to stay away from. First of all, it was not so interesting from a physics point of view. It was just a blown-up version of Fermilab, where I already was, but even so it just seemed that something wasn't right.

I had just proved this mathematical statement about a new acceleration method, and I caught the eye of the guy who headed the Argonne group on new acceleration methods. He wanted me to join his group. He asked me to come over from Fermilab to Argonne, and that's what I did. That's how I ended up at Argonne. Then, after being there for about three years, I became more and more interested in going to an HBCU—historically black college or university—because my only interactions with black students were in the summer programs, and they were for such limited periods of time that I didn't feel I was having the kind of impact I needed to have with the kind of experiences I had. The chairmanship of this department became available and I decided I'd come. It was a department that had a lot of growing to do.

How did you find out about it?

I have a friend named Joe Johnson down at Florida A & M, and he gave my name to the dean here, Dean Hicks. Dean Hicks called me up and just asked me. He had been looking for a chair for some time, so it kind of worked out for both us. That's what brought me here to A & T.

How has it been?

Oh, it's been a long, difficult process. I came in with kind of a heavy hand in terms of changing things. I had to terminate a lot of people. I decided that if I'm going to make this thing work, I have to just do what has to be done. So for those people who just were not up to the level they should have been, I just had to make a decision, for the benefit of the students and future generations of students, to make some changes. That has caused a lot of problems. There's one guy who has taken it to the legal route and that still has some fallout. It's a long complicated process, but it's no big deal. The point is that I was able to hire eight people—sharp, young, energetic people—which is unusual. In a three-year period of time that's a lot of people to hire. We've grown rapidly after three years.

How do you deal with tenured people?

They are difficult. You really can't do very much about tenured people.

You can't move them.

You can't move them at all. These were some people who were not tenured. They were just sort of tenure-track and people who were at that level, and I was able to just get better people into those roles.

What are you most proud of? I noticed some of the compliments, the achievements you've made since you were the department head, up to '94, I think, right? There were some very significant things, some you mentioned, but what gives you the most pride?

The most pride is from the quality of faculty that I was able to bring in. I think you've got to get the right people in place and then get out of their way. I think once you get the right people in place, you're well on the way. See, now I can concentrate on my own physics and other things because there are some sharp people in there. In fact, one of the junior people is now serving as chair of the department. It's sort of unusual for a junior person to do that, but he's doing an outstanding job.

I bet you had something to do with it.

Well, only in the point of hiring him. I think once you hire them then you get out of their way and let them do their own thing.

You've learned well.

Well, I've tried. I think if you get good people in place, they will take it from there. But you have to get good people, and that's one of the things I'm going to do now on this university committee on promotion and tenure. I'm losing many of my arguments, but that's fine. It's a committee, I'm chair, but I'm only one vote. I try to tell them. People hate to take other people's jobs, and I do too, but on the other hand you have to balance that against future generations of students because when you tenure somebody, you've got that person from then on and the question is, have you done the best you can do?

And this is what makes institutions like MIT as great as they are. They can take their best friends and tell them, "We've been good friends, but we're not going to be able to give you tenure." That's how you can be great like that. There's no other way to be great.

That's something I think HBCU's have a long way to go and need to understand, because we can be much better than we are. It should not be that when you're hired you're going to be tenured, and I just get that feeling this is what's going on. We hire you and when your time runs out, we don't want to take your job. The question that's asked is, "Have you done poorly enough to be fired?" instead of saying, "Can we do better? What have you done? Are you outstanding?" That's what we're dealing with, and I think there's a lot of education that needs to go on.

You received a lot of honors over the years. Which ones stand out the most for you?

Well, probably when the government of Ghana invited me over and named me the DuBois-Padmore-Nkrumah Lecturer. They paid for my wife and me to come over for two weeks. The head of state, Rawlings, gave us his personal Mercedes-Benz with chauffeurs, and I got a State welcome. I had an audience with the U.S. Ambassador, and I would go to different regions. Their country is divided up into regions like ours is into states. Every region has a regional secretary who controls political apparatus, and also you have

the traditional chiefs who control sort of the informal family background. So every region we went in we were given an audience with the regional secretary and with the paramount chief and the other chiefs of the region. So we were treated like a head of state. At least I know what it's like to be president for a week, two weeks actually. It's a grueling experience, though. Then every university we went to we were hosted by the chancellor of that university. Actually, they call them the vice-chancellors because the head of state is the chancellor of all the universities. So that was probably the most memorable one.

Well, that struck me when I saw that. By the way you wrote it I could tell that it was very beautiful, and I could understand why.

It was so important.

You and your wife have also traveled quite frequently to different parts of Africa.

My wife has been to Ghana. I've been to Ghana twice, and just in January I went to Benin for an international conference. I have close associates in Africa, but they come to the U.S. quite often. We have an organization called the Bouchet Institute, which fosters these collaborations between African and African-American scientists and engineers.

MILDRED S. DRESSELHAUS

b. 1930, AB 1951 Hunter College, AM 1953 Radcliffe College, PhD 1958 (physics) University of Chicago; staff, Lincoln Laboratory, MIT, 1960-1967; Abby Rockefeller Mauze visiting professor at MIT, 1967-1968; joined the MIT electrical engineering faculty in 1968 and physics faculty in 1983; Abby Rockefeller Mauze professor, 1973-1986; Institute professor, 1985- ; director, Center for Materials Science and Engineering, 1977-1983; council member, National Academy of Engineering, 1981-1987, and National Academy of Sciences, 1987-1990; president, American Physical Society, 1984; American Association for the Advancement of Science, 1997-1998; recipient, National Medal of Science, 1990.

I will focus my comments to some degree on my interaction with minority Afro-American people. I grew up in New York City and, at least starting with grade school, we had many Afro-American students and the number increased with time. I guess in the early grades we had a small number and the neighborhood where I was living was changing in ethnicity. By the time I finished grade six and went to junior high school, we had a majority, maybe seventy percent, Afro-American students in my school. So I had a lot of contact with Afro-Americans as friends. I went to their homes and I got to know something about their culture, which was different from that in my house. I had some very close Afro-American friends, and my friends and I were part of this community group in a settlement house. We had various common activities. I had, for an average MIT faculty member, quite a large experience with Afro-Americans as a child.

When I went to high school, I went to one of the special high schools in New York City called Hunter College High School. There, the number of Afro-Americans was very small, but I continued living in a neighborhood that was predominantly Afro-American. I lived there through college. I went to college at Hunter College, which had a small number of Afro-Americans, but more than the high school that I went to. I didn't particularly have much contact with them either in high school or college. They were very, very small in number and they weren't focused in my particular areas of academic interest. There was one young Hispanic girl who was interested in my kind of

math-science stuff, so I interacted with her some. Her name was Rosario Morales. This goes back many, many years. But I just have no recollection of any black person in my high school class. It was a very small class. We only had eighty students per year. Maybe there weren't even any blacks, I don't remember, but if so it was a very small number.

Then in college I started out in elementary school education, where perhaps there were some more minority students, but later I concentrated in math and science—physics and chemistry—and there weren't any minority students. I had very little interaction with minorities until I became a professor, basically. When my kids were growing up, we had one minority family living in our neighborhood in Arlington. The father of the family, McLaughlin, was an MIT professor. I don't know if you remember him.

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with Mildred S. Dresselhaus in Cambridge, Massachusetts, 6 November 1997.

In mechanical engineering, Ronald McLaughlin.

Ron McLaughlin. He was an extraordinary person and his wife was also extraordinary. I loved that family. That family was great. We lived about three blocks apart, and their daughter was in the same grade as my daughter. They were very good friends. They visited each other's houses and we had a good relationship.

The McLaughlins had quite a hard time, socially. As I remember, they were the only minority family in the whole neighborhood. They were high-intelligentsia people, and in every way very well-coordinated with the other people—who were predominantly professionals—who lived in the neighborhood, but they had a different color. Their social situation seemed to work out rather well until the kids became teenagers. As teenagers, their children had difficulty in the schools with social acceptance and so forth. So the parents put their kids in a private school and then they moved away. I lost contact with them. But I have a very, very positive impression of them, and their children had a very positive impact on my children. It was a wonderful family and I had quite a bit of dealings with them.

Shirley Jackson was one of the very early minority people I got to know at MIT. She surfaced, I think, just as I arrived at MIT in 1967. She was already here. She interacted with me a lot personally. She took one or more of my classes. We became life-long friends. At first, we had a mentor-student relation. I'm sure I am learning more from her now than she learned from me. Maybe she's mentoring me. She was an incredible person, and I remember the great respect that all the other minority students had for her, and the devotion that she had for them.

One of the young women I also mentored and who is also a life-long friend of mine, Aviva Brecher, was a very good friend of Shirley's when she was a student here. Aviva and I were two people to whom she could come and open up about all the problems that she was facing, and there were many.

Do you recall some of the problems?

She talked much about what she should do with her life. Women at that time were having not the greatest time at MIT. It was a question of acceptance and being taken seriously and all of that. Shirley had the extra burden of being of the wrong color. It was hard for her to be accepted.

Despite all of this, she was trying to provide leadership to the other minority students who were not even doing as well as she. She didn't think she was doing so well, but certainly she was hanging in there with some room to spare. She needed quite a bit of reinforcement at that time, just like many of the women students whom I mentored. She wasn't different from the other women students, but she had an additional big burden to face with regard to acceptance as an academic colleague in a white male environment.

We would talk about it. We would talk about it in terms of my feeling about supporting the women students here just across the board in all the departments, because there were just so few women faculty at that time. Shirley could see some of the parallels between women and minority students, and I think that helped her. I said to her, "Well, you know, I could write another paper or two in my research area." Of course, I've written many papers since coming here—that hasn't been a real problem—but at that time I said that probably I'd be remembered for my contributions to MIT more in terms of the people I mentored than in terms of all the papers that I've written. So if I write one or two less because of the time I'm putting into mentoring students, I think that that's a worthy tradeoff.

We would talk about that and I think it gave her a little bit of support for what she was doing. Perhaps she would have had a little higher grade in this course or another course or whatever, but I would tell her it was important for her to spend a little time to save some person who was about to fail, or leave, or do some awful thing to himself because of discouragement, et cetera. We used to have those kinds of discussions and I know Aviva had discussions with her too, not in my presence. Aviva speaks very fondly of those days and she feels that she—as a peer, and of the same age group—was able to offer a different kind of support and suggestions. I think I'm going a little bit off track with your question.

I think you are doing exactly what is appropriate. Could you talk a little bit about your experience in your profession, particularly in your academic department? You've seen and worked with a number of black students. Have you seen any difficulties that they have faced in being able to go through the department that you would consider somewhat different from any other student?

Yes, I believe that was true especially in the early days. I would say that the minority students that we've had more recently are more mainstream or mainline. There is much less academic difference in students of the '90s, and the minority students seem to have fewer problems socially with their peers. Shirley Jackson was a student of the '60s, or maybe very early '70s. She must have gotten her degree in '72 or '73, something like that. That was the pioneer era.

Calvin Lowe was an Afro-American student who was here in the early 1980s. I don't know the dates precisely, but we were working on graphite intercalation compounds at that time. That sort of dates it, and I remember some of the people he interacted with here. So he was here in the very early 1980s. He had a twin brother at Stanford, whom I know also. It's really hard to say which of them has done better. They've both gone far beyond anything we could have imagined at the time they were students. That's true of Shirley Jackson, too.

To extrapolate, I'd say that just about every single Afro-American student on my list here, in terms of any comparison you could make with peers here, their careers have been much more meaningful and they did a lot more than we could have expected from them. These students have simply had a large impact. Calvin Lowe is really a good example. His parents were sharecroppers or something like that. Calvin and his brother came from very, very humble backgrounds—these two boys with a lot of talent, going to the opposite side of the country, but they were always in touch with each other somehow. They were twin brothers in so many ways.

Calvin's preparation was very humble compared to expectations that we had of the students here. He struggled—he struggled a great deal. I'd say he struggled in two dimensions, one with the academics and the second with the socialization. He was really quite unfamiliar with dealing with white people. He didn't quite know what the expectations were, what the standards were. There were just lots of problems that he had to face that other students didn't. Some of this had to do with his black color. I think the McLaughlin children, as I knew them, didn't have many of the socialization problems because they had grown up with white kids all along. Maybe they didn't know black culture, and they only knew how to deal

with white people—that could be, and this could also have been a problem for them.

But the MIT experience that Calvin had really seemed very, very difficult for him at the time. I arranged a special position for him at the University of Kentucky as a starting assistant professor, when he finally finished his thesis at MIT. We had to work really hard to graduate Calvin. I think that he has understood this and he has appreciated the effort and all that we tried to do for him. So when he graduated from MIT, I tried to arrange the next experience to be one where I thought he would have a good chance of success. I managed to talk somebody into giving him a junior faculty position. They were anxious to hire a minority person. This was back in 1982, very unusual at that time. The reason I placed him at the University of Kentucky is that I had a former group member there, Peter Eklund, somebody five to ten years older than him, who was well established in the department—already had tenure, could look after him, take him under wing. Not only that, this former group member was doing research quite close to what Calvin knew. Thus, he could not only have mentoring, but a good infrastructure for starting an academic research career. I told his mentor, "Here is your charge. I took care of Calvin at MIT and now you should look after Calvin, and see that he succeeds." Of course, I wasn't there to check it out and this guy was twenty years younger than me. But I know he put a lot of effort into Calvin and tried very hard to run interference for him.

I would say that Calvin's first job probably didn't work out up to Calvin's expectations or their expectations for him, but he learned a huge amount about himself and what not to do. Peter helped him get another job and the next job was at a black college. You probably know about his career better than I do. I visited with him recently and he's now sort of Number Two man at Hampton University.

That's right.

When I visited him at Hampton, the most amazing thing was to see what's happened to this guy. I could see the imprint of MIT all over him. Many of the things that he could not do himself as a student, he held up for Hampton students as standards. He had very, very high expectations for the students and he had ways of helping them to

achieve those expectations, maybe better than I had when I helped him. He was very creative and imaginative. He was very much involved in developing an information system for the University and many other plans for doing big things at Hampton. He was terrific at going out and raising funds.

I had involved him in many people-related activities at MIT. It was clear from the beginning that he was a good people-person. As a graduate student, he had people skills that were far beyond those of the other students. Even though he didn't really know how to interact with the white community so well, he knew how to interact with vendors, especially minority vendors, and more with ordinary non-technical people whom we had to interact with, such as workmen. I could recognize this skill when he was a graduate student. I gave him responsibilities in people-related activities, and he volunteered for responsibilities in dealing with these kinds of people and situations.

Now that I look back at Calvin, he has made a career in that. He has been very, very outstanding at what he does. He's probably the best student administrator regarding personnel I have had. I must have had about sixty graduate Ph.D.'s I've trained up till now, and I think he's Number One when it comes to administration and how to organize people, except possibly for Ibo Matthews, a current minority student. Calvin is very talented at this, he knows how to go out to get money, he knows how to make a strategic plan and how to execute it. He may have learned some of these things watching me, but he picked up a lot of these fringe things while he was at MIT. I was sort of focusing on the science for Calvin and getting him through that. On the side, I gave him these other assignments because he was so helpful and good at it, and these side assignments gave him a feeling of accomplishment and helped him gain the respect of his peers. It was interesting how these sideline activities turned out to direct his later career—science management. He is really exceptional at it.

You bring up a very good point about Calvin that I think deserves some elaboration. You say you were sort of surprised at all of the things that he picked up or has become. Is that based on the fact that he rose higher than you really thought that he could?

I think so, because normally the students we graduate from MIT show some correlation between

their physics knowledge and where they land up. Calvin was able to use what technical expertise he garnered here in ways that were much more general. He learned a lot of things from us here, but it wasn't only "f = ma" type things. I mean, he did adequate science work to get by. I believe that I judge students a lot on how well they do with their research accomplishments. Calvin never really excelled as a researcher, either as a student or later on when he went to his first job. He is certainly not the only student in this category. But I would say the great thing about Calvin is that he did well enough academically to build a career for himself in academics. He recognized early on where his talents were. He recognized how to use the technical skills that he did have along with the other skills that he had to make an exceptionally good career.

So Calvin was an unusual student and he became an unusual professional. I think we had some dealings with Calvin between us.

Yes, we did.

You remember that. I think that this experience had some impact on him, but not enough, because he ran into a different kind of difficulty in the responsibility area when he was at Kentucky.

Do you have a sense about what that kind of difficulty was and how it was different?

Well, it was sort of not paying attention to his teaching responsibilities, sometimes not showing up for class, and being too loose about his academic responsibilities. He certainly didn't get these bad habits at MIT, because at MIT we are very fussy about professional responsibilities in dealing with students.

But, you know, young people go through changes in their lives. I mean, they're growing up when they're twenty and thirty, and they're maturing. I don't believe Calvin repeated any of these mistakes. All I can say is that since leaving Kentucky, Calvin has learned how to find out what the rules were and how to work with the rules as he proceeded, and in fact to make the rules work for him.

Do you have any sense of why Calvin and Shirley and some of the others gravitated toward you?

Well, all I can explain about Shirley, Calvin, and all these other Afro-American students on my list here, is that I'm a minority person also. I'm a different

kind of minority, but I am a minority person nevertheless. I have overcome some, but certainly not all, of the problems minority people face. I'm very positive that we as minorities have the power to effect change. I try to help women and minority students overcome obstacles by mentoring and by example. We could talk frankly.

Many of the faculty members, at least in the early days before we recognized affirmative action or whatever, didn't care to go the extra mile to help women and minority students. I was always interested in helping them, trying to do the best I could with them. The rewards have far exceeded any expectations, because both the women and minority students I mentored have had a huge impact individually and collectively. When I look back at the program at MIT in the minority area, I think it's pretty amazing. We have a great deal to be proud of. We were in there at an early time. From my standpoint, among the people who I think were leaders in my time was Jerry Wiesner, who had a very strong positive feeling that everybody should be given a chance. He felt that way about women and he felt that way about minorities also.

I agreed with him on that. I think my early experience of growing up in a neighborhood with many minority people helped me because I could see what they were like. They were not unknowns to me. I think those factors helped to lower the barriers, and therefore minority people came to me and talked to me about their problems at MIT, and they also sent their friends who were having problems.

There's another factor that I think is very important about minorities. I should mention my activities in the early '70s that I forgot about over here that I think had a big impact on minorities. I can't tell you the individual minority student names, but I do want to tell you about the academic subject I taught called "What is Engineering?" That program started about 1973. I did it for about three or four years and we worked up to about two hundred students per year in that subject, maybe more. Maybe three hundred students per year were taking that subject. The objective was to introduce freshmen and sophomores to what engineers do in careers.

I recognized that the number of women students was increasing in the early '70s. We went into a rapid rise in the enrollment of women. But

they were not going into the engineering school. Instead, they were going into certain selected departments and not into mainstream MIT. I thought this was a bad thing, because if women were ever going to become twenty percent or some reasonable fraction of the student body, which they actually became by the end of the decade, the enrollment of women would sort of bias or slant the focus of what MIT is all about. If women were to become a large part of the MIT organization and if they were in restricted academic areas, then women wouldn't be in other areas where MIT already had a large faculty and research commitment.

So it seemed to me that MIT should try to put some effort into mainstreaming women students so that they would feel free to go into all the academic departments. To address that issue, Sheila Widnall and I designed a special academic course. Sheila Widnall and I taught this course for several years, but I taught it most of the time. We launched the project together, but for whatever reason, I did more of the teaching than she did. We never kept score in terms of who did what, but between us we tried to cover the territory. She did the most she could do and I did the most I could do, but in this particular activity I spent more time than she did.

The reason we got into this course was to acquaint women with what was happening in the engineering school and telling them there was a place for them in engineering. We had an inordinately large fraction of the women students take that course when they were freshmen, just to explore many aspects of engineering as a career. A large fraction of women actually went into engineering, and many of them decided to go into some other major. That was fine. But in this way, many women at least had exposure to engineering in a friendly way, and I believe it was influential in broadening the distribution of women among academic departments.

At one time, I taught this subject two semesters a year—spring and fall—and we had a lot of students. Also coming to this subject were perhaps half or maybe two thirds of the minority students who were admitted in all departments. At these early times, minority students, like women, were tentative about going into engineering, by and large. They didn't know what it was, they didn't have dads who were doing it. So we had them

attend the classes—well, they elected to come—and they participated in the class.

In this way, I got a chance to know quite a few minority students and to mentor them. A lot of the activity in that course dealt with career counseling. It boiled down to mentoring, because we would have many discussions in class with guest engineers who would tell us what they did and how they became engineers. The subject was listed as a freshman seminar, so there would be a lot of discussion back and forth on different things. I think that this course also had some significant impact on getting minority students to take majors in the engineering school, or at least to take some fraction of a minor in engineering. In fact, engineering subjects are appropriate for some of the various non-engineering majors that we have at MIT. Some students minor in engineering along with a major in science or management or whatever else.

This subject, “What is Engineering,” was started in the early '70s. That was before Calvin Lowe's time. Later in the '70s, I had two African students. One was Augustine Mabatah from Nigeria, who just came around as would any other graduate student looking for research projects. I started him on a project that I selected particularly because I thought it wouldn't have such complicated equipment and he could make use of some of the laboratory experience when he went back to Nigeria. He did go back to Nigeria and he's still a professor there, after all these years. He's done well there. Physics was combined with optometry at his university, so he came back later to study optometry and we had some interaction when he came back to the U.S. to get another degree in optometry. He had no experience with optometry as a graduate student at MIT. He couldn't train optometrists on the basis of a physics Ph.D. here at MIT.

Augustine was a gifted student. He didn't have trouble with the academics. He was pretty much average with regard to getting through all the exams, completing a good thesis in the average time to graduation in that department. He integrated well into the MIT environment. He was a very pleasant individual and integrated well with the students in the research group and as a teaching assistant.

I believe that he knew this fellow Petero Kwizera, but I'm not really sure. Their overlap was

either non-existent or just by a couple of months. Kwizera was a guy from Uganda and Mabatah was from Nigeria. Those are different countries with different cultures, I guess, but in this country they were both Africans, so they had some connection to each other from our standpoint. I think they knew each other, and I believe that Mabatah might have had some difficulty at MIT before he came to me. I don't think I was his first supervisor. But once he came to me, he was with me for his whole stay at MIT. Wherever he was before, he wasn't there too long. We had a good relationship and he did a very good thesis and everything worked out well. I was particularly mindful of trying to train him in some kind of research direction that he could follow after returning to Nigeria. I tried to get him into an area that did not require a lot of very expensive equipment and procedures and clean rooms and all kind of infrastructure that he wouldn't have in Nigeria.

So you sort of prepared him to go back in a way that suited his culture.

I did so to my best knowledge of his future situation. He was very academically oriented.

My next student from Africa was Kwizera. They almost overlapped. In my recollection, they were very close in time. When Kwizera came, he worked on several projects, but much of what he did was quite similar to what Mabatah did. I didn't have another student who pursued that track except for Kwizera, and for the same reasons. Kwizera was really quite different from Mabatah. Kwizera was interested in the bigger context of science in society, and as a graduate student he took some courses, I guess, at the management school. There was once an opportunity to participate in a workshop on developing countries that I heard about, and I asked if they would accept a student. They said that they would, and so I recommended Petero Kwizera. They had people of all ages at this conference. Of course, they were all Ph.D. physicists except for Petero. He made a remarkably good contribution to that conference. It was sort of clear to me at the time that this guy would be somewhat broader than an average American student, and his career in Africa has been a little bit like that.

He couldn't go back to Uganda because Amin, who was a crazy man in Uganda, was after his family. It was a very stressful situation for

Petero. While at MIT, he got married to a young lady, a West Indian or Afro-West Indian, I don't know how to call her—not an American because West Indians are not American, but they are somewhat close. She was a graduate student in one of the colleges in the Boston area, and they met here in Boston. I guess her country was one of the West Indian islands, but they decided to go back to Tanzania. They went back there together. It was very difficult for her at first because the Tanzanians accepted Petero all right—it wasn't such a big difference for him to go to Tanzania rather than Uganda—but it was a big difference for her. However, things seemed to work out well, and she's still there. They made some kind of career together in Tanzania and they raised a family, and had quite a few kids. I think everything has worked out well for them.

I see him from time to time. He comes by now and then. He's been back to MIT for a couple of months' study now and then, I guess it was sabbatical leave or something like that. I could therefore see what he's doing in his career. What he does is a combination of technical student and more management-oriented things.

You have visited?

No, no, no. He has invited me, but I've never gone—no time. He said he'd stop everything that he is doing and give me a month's tour of the Serengeti and this and that, I guess. He likes me a lot.

He came to me for the first time when he was in real, real trouble. I remember how I met him. It was an experience that at the time scared me a bit, but it started out our relation and we've been good friends ever since. At the end of the day, it was a winter day, it was dark in my office. I was over at 13-306 at that time. I walked into my office. It was totally dark and, of course, I didn't see him. I turned on the light and here was this black guy sitting in my office. I didn't know him. Who was this guy? So I asked him, "What are you doing here?" This is the way the conversation started. He said, "I'm waiting for you." Well, that scared me even more. But then he told me that it wasn't what I thought. He wasn't out to get me in any way. It was that he had had a terrible experience with his prior thesis advisor, and he was about to have to leave MIT and this was a big disgrace for his country, for him, and for his family.

He had heard that maybe I could help him. At least somebody told him that I could help him. I said, "Well, we'll try."

By that time, I had had more experience with minority students than at the outset. In the end, I remember that I did rather well with him. He did a good thesis, and when he had his thesis defense, I still remember that people on the thesis committee were very pleased with his thesis outcome.

What I hear is that a lot of the students were referring students to you.

Oh yes, all the minority students who came to me were referred. I never went out looking for minority or other students. I never had a minority student whom I recruited. They all came through the grapevine. I believe that there is a very strong grapevine going on here. I don't know anything about it, but word gets around.

Elias Towe is another student who comes to mind. He was a student of electrical engineering. I had him in several courses. He was a good student. I was on some of his departmental examinations. He did very well on them. He was a talented guy, very mature, reliable, and he was good at many things. When he finished his thesis, MIT offered him some kind of junior faculty position here that was between electrical engineering and materials science. He was in a bad situation in that position because it was sort of created just for him. It wasn't a mainline position, and as a result, people were looking at him this way and that way. The expectations that they had were totally unrealistic.

I advised him to look for a job somewhere else. I told him that I didn't think this position was going to lead to too much. It's hard to tell people things like that. I told him anyway, and I tried to help him get a better job. I wrote a lot of letters for him. He soon got a position at the University of Virginia and now he's a full professor there. He is very well liked and he has a very good research program. Right at the moment he's a program manager at DARPA.

I know the young man you're talking about. I just remembered—a tall, slender fellow.

Yes, very well spoken. He was an African. He was originally from Uganda, but you could hardly tell. He spoke American, but he didn't have a Southern accent or anything. He spoke like an MIT student. He didn't have problems dealing with white people ever, but he was put into a lot of very, very bad

situations that were totally unfair to him. People just didn't understand his situation.

So he went to the University of Virginia. I think the University of Virginia was looking for some minority faculty members and he was hired a little bit on an affirmative action plan, but I think his contribution has in practice been very good. He met the qualification of a regular faculty member, like we want it to be. He's excellent technically, I would expect. I've visited the University of Virginia a number of times since he's been there and I only get very good vibes about his performance. We never discussed the minority issue with faculty members at the University of Virginia. He's just a good faculty member. He works hard, he has a lot of students, he gets good support—federal funding.

Why do you think he didn't make it here?

I think a person who gets a degree from MIT should go somewhere else at the outset. People here looked at him like a student and he wasn't given resources like a regular faculty member coming from the outside. He had a poorly defined position. It was between two departments and everybody was looking to the other one to help him out. His sponsor, Gretchen Kalonji, was having trouble with the departmental administration. She was his big advocate, but she was having trouble herself with her career at MIT, and I think some of that reflected back on him.

Your advice was good, as usual.

Well, I think that maybe it wasn't so easy to give him that advice. But it's always good to leave your institution after a Ph.D. and come back if you want to, after being gone for a little while, so that the people who are there can look at you afresh, so that you're not viewed as a student any more.

That was Elias Towe, and we're still in touch. He just called me up and invited me to give a presentation for his program. He wanted me to give a talk at DARPA about thermoelectricity. We talked about old times, but in quite positive terms. He always brings up old times.

I have Cynthia McIntyre on my list. I got to know her while she was an MIT graduate student. She must have been at MIT in the mid-'80s, some time around there. I had her in several classes, more than one class. I tried to encourage her especially. She had a bit of a self-confidence problem at first. After a while, her confidence grew. I think she's

doing rather well now. She's well respected, especially among minority physicists. She's active in science, but she's also doing a lot of things outside of just classroom teaching. Even when she was at MIT, she was kind of a broad person and she remains a broad person. I don't know what her career will be like, but I wouldn't be surprised if she branches out into quite different areas because I think she has talent in administration, people, and organizations. I guess that such a mixture makes quite a good career. Not all my people like a broad career, but some people.

Now we get to the present and recent people, in the 1980s. Gillian Reynolds got her Ph.D. maybe two or three years ago. It was curious how she got her job. I had dinner at the MIT president's house one evening, half a year or so before she finished her Ph.D., or maybe a year before. She had a lot to offer a potential employer. She was in a strong position, ready to look for a job, but we hadn't yet started looking. That night, I was sitting next to the head of R&D at Du Pont. The conversation came around to, "I wish we had some minority people on our technical staff, but they're just so hard to find." I said, "You know, I've got somebody in my group who's about to graduate. I think she would fit into your organization very well. Let me give you her name." So I gave him her name and a brief summary of her qualifications.

She soon got an interview and she got hired. She had several other interviews and job offers. She got to make a decision between good and very good, and she decided to go to Du Pont. She's still there. She's risen in the ranks. They put her in charge of their carbon nanotube program. This is the first project under her direction, and this R&D could possibly develop into a significant business. It has interesting science, it has business potential, and I know something about the field so I can offer this opinion. I therefore meet her at conferences from time to time. I was at a conference recently. She was the only black person there, the only Afro-American there, but you know, she handles all of this just fine. She loves her job, she likes Du Pont. She's bought her own house and is a happy camper.

She's a student who came to me when she had a lot of troubles. She didn't start her research work with me. She started somewhere else. I don't know anything about her prior history, but I know it was bad. She came to me really down in the

dumps, hating MIT and hating all the people here. She had some deep scars. You've seen that situation before, I'm sure.

Yes, several of them have gone to you one way or the other.

I think when she left MIT, she was a little bit more favorably disposed. We like to have happy campers. I don't like having a student leave and have bad feelings about MIT. I think that as the distance grows between her stay here, she sees more of the bright side of MIT and feels that MIT prepared her well, gave her good technical training to do her job. She has learned a lot of the other things at MIT that are necessary in a career besides just science—proposal writing, how to plan research, how to handle other people, and how to deal with peers and people less experienced than you are. She's a success story.

I have two students who are with me now, Ibo Matthews and Sandra Brown. You might know them.

I've heard of them. I don't know them well.

Ibo is a strong student. He just happens to be an Afro-American, but he's the strongest minority student technically that I've ever had. He's good in the science part of things, and he's extremely active in a zillion other activities. He headed up the National Black Physics Conference here. He has a talent for organization. He has a lot of good people skills. He's a graduate tutor at one of the dorms, the one where that girl got killed on Friday when crossing Memorial Drive. She was one of his charges. He was devastated by that incident. He went to the funeral in California. He's on his way back to MIT now.

He's a little bit like Shirley Jackson, twenty years later, with kind of broad interests. It's a little hard to figure out what he's going to do with his life. The other thing that Ibo has is a very deep interest in Japan. I've sent him to Japan on two different projects. He speaks Japanese. He has even written a piece for me for a study I was doing about his experiences in Japan. I wanted him to address how it is for minorities to operate there. Before he went, I asked some of my buddies in Japan, "How do you think it would be if I sent a minority student to work on a project?" They said, "Don't do it." Everyone said "Don't do it," and I had this terrible thing—what do I do? I got all this advice, "Don't do it."

But I did it anyway, and I would say that he made out very well in Japan, almost better than anybody else I sent there. He was well above average technically, in the upper echelons—top maybe five or ten students, on that order of magnitude. He did exceptionally well socially, he liked the experience very much, and he felt that the Japanese were very fair to him. He felt that his minority status actually helped him to relate to them better. He knew how it was to be in a place or in an atmosphere with different cultures. He could appreciate that they had a different culture from white Americans because he also had a different culture from the standard American culture. He emphasized that a lot. He felt that he had the maturity by the time he went that he could kind of take the lead in the minority status business—get that over with early in a conversation, you know, and then act like a regular guy. He could be more interested in their culture than most foreigners and be interested in how they do things, and he would not try to get them to do what he was doing.

Because he knew better. He could appreciate it. He had been through it himself.

Yes, he could appreciate multi-cultures and how people with different cultures could work together.

Did you say you think he is one of the better students you've had?

Yes. In general, I would say that he's one of the better students I've had, independent of Afro-American or anything. He's the best technically among the Afro-American students that I've had. I wouldn't hesitate in putting him in a faculty position somewhere. Right now, he wants to get some postdoc experience like the others do, which I think is good. He may want to go into industry. But whatever he does, I think that he's going to go into some kind of leadership job combining technical and management—a little different from Calvin, who is almost entirely management. I think that Ibo is much stronger in the science end of things, but he has a lot of the same skills that Calvin has. He doesn't have the same minority status.

What do you mean?

Well, he can deal well with people who are not minority people and feels comfortable with them. He deals with everybody. He went to UC

Davis, so he's been in a more broad spectrum of situations.

Calvin came from North Carolina A&T, which is a totally black institution.

Yes, and he grew up in a kind of black environment. I think that Ibo has been in a mixed community all the time. He's really interested in science and technology. He really loves it. I imagine that he'll stay with that at some level for a while.

Sandra Brown is my other black student presently. She comes from the West Indies. Her background is almost the same as Gillian Reynolds. I think Gillian sent her to me. These students bring each other to a degree. Sandra showed up one fine day and asked if she could join our group. She also was in some other group before coming to me. Everybody was in some other group. She was in some other group and didn't have a real good experience, so she came to me pretty early in her career. I would say she's about two years from being done and Ibo is about one year from being done. He must be one to one-and-a-half years ahead of her.

She's got a tremendously sweet personality. Everybody likes her and everybody depends a lot on her. Gillian was like that, too. Gillian was a person who did a lot, in a personal way, for the other students. She's spending the summer in Germany now. She's interested in Europe, in European cultures. She's been in the German program here, studying German, and she also can speak French. I don't know if this is common. She's now an American citizen, having been naturalized, but she's part of this new movement that is interested in exploring the world. So I'm helping her to get a position in Germany for the summer. She wants to be in industry. She says she's been in university all her recent life and she wants to see what life is like in industry. A black woman in German industry or in a German university, I don't know how it's going to work out.

You make it your business to continue the legacy of yourself. You take these individuals and let them go where they want to go. Usually, these are people who go into places where they actually are unique, because the people in that particular arena are not accustomed to seeing people like that there. You have been the same way.

We talk about that and I try to stack the cards so that they succeed.

How do you do that?

Well, for example, take Ibo. Ibo has been to Japan on two or three different assignments, maybe four assignments. I have worked things out with the professors and researchers there. Some of it has been in academia, some has been in industry. Then he was in the JAMS—Japan American Mathematics and Science—program. So he has done a lot of different things with the Japanese. But I do some ground work before he gets there, so that he has opportunities and is successful. I think that's important to do with every student when you send them abroad, not only for Afro-American students.

What groundwork would you say you do?

Well, the groundwork I do is we define exactly the problem that they're going to work on and what the expectations for them and from them are. The professor knows what he or she is expecting, so that the student has appropriate access to the equipment and he has some other student or researcher helping him get started with the use of the equipment and facilities. The students have always succeeded in accomplishing what we've discussed because the student and the professor both know what each is expecting and the students don't want to disappoint me or themselves.

Now, what that means in practice is that the students have to interact with the other students and researchers in the group where they are visiting. I sort of set up the visit schedule for them because I have other people I would like them to interact with while they visit the country, and they do this quite happily. Through this approach, the student gets a chance to visit four or five different locations and meet different research groups. He stays for two or three days at each place, and at the main research location he may stay for a month. There he completes his main project and different sized projects at the other places where he does short visits. I think that that's been a good approach. Then with the company, I arrange for a good supervisor. I select a top person there who speaks good English and has been to the West, so that the supervisor knows a little bit about the student's expectations. Supervisors tend to treat employees differently in Japan than they do in the U.S. I think it's important to realize some of these distinctions.

But I do that with all the students I send abroad. Ibo was not the only one who was given an opportunity to work abroad as a graduate student. One reason that you have to have rules is fairness. A second reason is accountability, since I often have foreign exchange programs such as the NSF exchange programs. I currently have such a grant, and I've had different grants in the past. These agencies want to have a report on what was accomplished on each trip. Well, I found that unless I arrange it carefully before sending them, the students don't accomplish much.

It's amazing in one sense. You said that you do that for all students, and I'm sure you do.

I don't treat the minority students differently.

That is why they gravitate to you, I suspect, because they don't see any differences in terms of how you deal with them than anybody else. The biggest problem is when I hear students saying that they are treated differently. They don't want to be given something as opposed to working on it.

Well, not every student goes for foreign experience, only selected students. They have to be, first, quite senior because I won't send them when they would be a burden to the group where they're going. They have to be a good contributing research member. They have to gain a certain level of technical competence before they go and they have to be interested in going. The receiving person meets them first, so they already know who's coming. In this way, it's not a surprise to them. The student and receiving person have usually already worked together, usually published a paper together before the visit, so that there's usually some established contact.

With the German visit, we're doing that one a little differently, because Sandra Brown started doing the arranging on her own for some reason and then told me after she started. I said, "Well, you should have told me to begin with, because I would have fixed you up with somebody I already know." But she started working things out with somebody on her own and tried to arrange a visit. We looked through the various things that this researcher worked on and we had some technical discussions before the visit started. When the professor is more actively engaged in the planning stages, the outcomes are usually better. However, we should not discourage students.

So what I did with Sandra regarding this visit is that as soon as I heard she wanted to do this trip to Germany, we selected a topic that made sense. However, as it turned out, she worked on something else that was in her background before coming to MIT. They're doing some things at this German company that will help Sandra with her thesis work. She knows enough about research generally and she has enough background so that she can talk to all the people around her when she's in the German company. She learned that from our group. Sandra is very good at interacting with all the members of our group, so she'll just do the same thing with them.

I took her to a conference recently. We went together and we roomed together. We were roommates. Sandra was very popular at the conference. In fact, she was the most popular student at the whole conference. I was in my room at night, but she was out there with the guys having a good time. I think that she's learned how to interact with a wide range of people.

I have students who interact strongly with visitors. We have a lot of visitors who come to our group. Some of the students are very shy and they don't know how to interact with the visitors. Maybe half of them interact strongly and they learn a lot from the visitors.

Are many of these foreign visitors?

Most of them come from different countries, yes. Some of them come for a few days and some of them come for months. Sandra is very interested in people from different cultures, and so is Ibo. They are outgoing, so they get to know these visitors on average better than the other folks.

I don't throw minority students into situations without some prior discussion. They interact with visitors on their own, but I encourage it. That's important for all concerned. They know it because, when they leave MIT, these are the contacts that they have worldwide and they use those contacts in their later careers after MIT. Also, race differences really disappear because they have a contact who introduced them. Minority students become regular guys that way. I think that it is really important for minority students to have these contacts worldwide.

What advice do you have based on your experiences with black students? Your experience is quite extensive in comparison to the average faculty member.

Well, I have three minority students right now. I have Ibo and Sandra and I have Joe Habib, who is of Egyptian origin. He doesn't look so much like a minority student. He's sort of on the fringe of looking like a minority person. He, however, does activities on his own in minority camps for Afro-American students and stuff like that, so he considers himself a minority student. He's going to be getting his degree.

We didn't talk about him before. He's a little different case because he doesn't look like a minority person when you look at him, but he does have many minority aspects to him. He went to poor schools in Washington, D.C. He came to MIT very unprepared and it was a culture shock for him here. He had a big shock on how it feels to work hard academically. He has never seen people work the way MIT students work. He's had a lot of troubles as a student with the academics and getting through this place. I think I'm going to try to get him some kind of postdoc position, and then we'll see. Maybe industry will be his first choice. We're at the point now of having his first *Physical Review* paper. It's taken a long time relative to other students in the group, but he has it and I think it's a good paper. I like it. It's taken a long time to get to that paper. We worked through many drafts, but it's there now and we're going to be sending it off to the journal this week or next week. It's at that point. Once he gets past that, I expect that we will make a phase transition with regard to becoming a professional, and then I will feel that he can start interviewing.

Until students get to that point, they're not in the category of looking for jobs. I don't want to embarrass the student or MIT, and I don't want to waste the time of the interviewer. We have some standards in reaching the final stages of the degree program. Joe has reached that point and we can now start talking about careers. We have talked about it a little bit, but I'm not really too sure what he wants to do. He's a guy that could go to academia if he wants. There are jobs for a person like him. If he does that, I think he should have a postdoc and get to see research at some other places.

You have talked about all the students that you can remember.

I'm not sure that they were all the students, but they're the ones I can remember.

I'm sure they're not, because I remember at least one other. I can't remember his name, but I know he talked about how much you were helpful to him and how you worked with him, although he did not get what he came here for. I know that for a fact. That was about the mid-'70s, when I was down in the Graduate School office. And I know there are many others. Several others. You're very modest.

I think I mentioned most of the students with whom I had a strong interaction. There were some other people when I was department head over in EECS in the early '70s. I made a special effort to have lunch or some kind of social interactions with the minority students. I think that was very useful, but I don't remember their names because we didn't work on any research problems together.

What advice would you offer particularly to black faculty and black students?

Let's start with students, because I think the students and faculty are kind of different issues maybe. For MIT, it is important for the Admissions Office to select students who will succeed, and I think you're getting much better at it. I think in the early times, back in the 1970s, some students who came here weren't well matched to MIT. I would say the ones I've seen in recent years are much better academically. For whatever reason, you're doing a better job in selection.

I think selection is important. All the students who come here, even the ones who don't make it, are very gifted students. Then if they don't make it, they have this burden all their lives that they didn't make it. We don't need that. I think it's better to try to match the student and the place, so that they're not so marginalized—or not so marginal.

I think some of the projects that you have are very good. You have sort of a getting-up-to-speed program for the undergraduates, and I think that's good. It shouldn't be only for minorities, and I think you do have other students who could join this early-bird program, students who have some deficiencies in their training. I think such an introductory program is a good program for minorities even if they are not disadvantaged—just to get to know the place and the people and to socialize. I think that's good. I think that especially during the freshman year, it's important to have some kind of activities for minority students—get-togethers where they can meet other minority and non-minority students. You also have a good tutoring

program. I would say that it's been good. I don't know if they all use it, or if those that should do so, but I think it's a good thing.

The most important thing is that MIT cares about them and that they're introduced into the network here, and that they make a network with each other. When they run into some kind of harassment situation, they can then discuss it with another student who has also run into a related situation before and say, "This is what we did." Or they come talk to their advisor or other resource person. I think those kinds of support systems are important.

Then when the students get a little bit toward the end of their degree programs, they need quite a bit of career counseling. The physics department puts on a dinner once a semester for minority students that is enjoyed both by the minority students and their faculty supervisors. I think that these dinner parties work very well. I always go to them when I'm in town. My students all show up and it's a jolly affair. They all see each other and it's just a nice, nice friendly social event. If all the departments could do something like that, I think it would be very beneficial—not that expensive, I think, but anyway a good investment. Every department could probably figure a way to do such a program.

I have looked at our history relative to blacks from the beginning of the Institute to the present. One of the things that strikes me quite vividly is the fact that the physics department has always, particularly in the late '60s, been progressive on race.

A lot of that has to do with Al Hill. He was a strong supporter of minority students, and he put effort and resources into it. He believed in it, and many of these things that we have today were started by him. The impact of the MIT black students on physics nationwide is incredible. When you look at U.S. physics broadly, and when you see black people who have made it in physics, a large fraction come from MIT. Many of them have complimentary things to say about Al Hill and the MIT support system, even though many say the work was very difficult. So that could be a benchmark for what other departments could do. I would say that Al Hill was a role model.

Minority faculty is a more complicated topic. In our department, we've had Cardinal Warde. He had some rocky times in the early years where

people didn't believe in him that much. You probably know the details of that as well as I do, and probably better than I do. Then the next phase is that he did get tenure, and I think he's doing a good job for us. I think he has worldwide recognition for his research. He's really been focused on the academics and in supervising graduate students, training graduate students, being a good teacher and innovator, and he has a certain field of optics applications that he's a world expert in. But it wasn't easy for him to get there. Especially in his young years, he had a really hard time gaining acceptance. I would say that he also worked out much better than anybody expected at that early time.

Wes Harris is another example. I don't know if he had a hard time or didn't have a hard time. I don't know exactly where he is now, but I run into him here and there.

He's back as a full professor here.

He was around a lot in many places and he has done a lot of interesting things. He's gained a lot of recognition for himself and people have a lot of respect for him.

But he had a person just like you who worked with him and continues to work with him behind the scenes, just as you've done with all these students you're talking about—I mean, almost an identical-type person.

When I see him in various contexts, I would say that his contribution to the country—in all different dimensions, because he's contributed in a lot of different dimensions—has been far beyond what we could have expected back in the early days.

Leon Trilling had a lot to do with it.

That's interesting. Leon's a guy with a lot of patience.

Well, you are too.

We're very different. I'm very impatient compared to Leon. We have a new fellow in our department, Akinwande. He's a Nigerian and he has a lot of industrial experience. It will be interesting to see how he makes it here. We did a little project together on ethics. We were just sort of understudies to Steve Senturia, who was the master of the program. I was involved with it too, but Tayo Akinwande did a lot more than I did. He really has a lot of concern for the students. He has done a good job with the ethics project, but he seems to be coming along more broadly.

I know that you recommended Shirley Jackson for the faculty here.

Yes, I did. I recommended her for the faculty here, but I recommended her for a lot of other things, too.

I know, and probably many things that I don't even know about. But I know about this one area. What do you think was the problem there?

I think people don't appreciate Shirley's strengths. People were looking at her impact on physics because that would be the department that she'd be in, that's what she's been working in. So they compare her physics to other candidates in that age group. I think that was where her problem was. What they don't look at is all the other things that Shirley has done, can do, and does do. She's on many boards and became well known long before she ever applied for any position. She's on more boards than anybody I know. It's not only that she's on these boards, but she's a terrific board member. I've been at different conferences and on various committees with her. She's so sensible and she has such an acute mind. She just focuses on the essence of things so well. She far surpasses almost everybody I know on these committees. But somehow the faculty members don't put these attributes into the equation. So, from that I conclude that being a faculty member at MIT isn't the right job for her, because she wouldn't be appreciated.

Well, let's look around—Sheila Widnall. She had a pretty hard time here at various stages of her career and she has made it much bigger outside, where people could appreciate the spectrum of things she can do well. People were very late to recognize her attributes.

Shirley's probably the best person they've ever had in her present position at the NRC, the Nuclear Regulatory Commission, both technically and administratively. She's a real hard-nosed person who pays attention to details and has a lot of guts, and works hard. I could predict all of that, but I think that many people were surprised that she is as good as she is. Some people say that she is a black woman and for that reason was given a political appointment—the President wants to have black women in this administration.

But you knew better.

I know what she is. This job seems to me to be just her cup of tea. She has performed very well, but

I'm saying she has better qualifications than anybody I know who has had that job before. But people, in thinking about her, probably thought this was just one of the president's political moves and didn't take her at face value.

Take Margaret MacVicar. She was another good example of an under-appreciated woman faculty member for much of her career. She had a very hard time in gaining any acceptance here. There were many people who didn't recognize her capabilities. It was kind of interesting that when they had her eulogy, we heard all the good things that people had to say, but I remember very well all the years when some of those same people were having a hard time accepting her.

So what does this all mean? It means that women and minorities, and minority women in particular, have a hard time in being accepted for what they can do. I know that. It's like that with me, too. I have had the same problem to some extent. People don't think I can do many of the things that I actually do.

You prove time after time, though, that that's not an issue.

Hopefully we all do that, but I think that the important thing for this century is to make sure that minority students and faculty have a full spectrum of opportunities. I've done many public service and other activities—not because I particularly wanted to do the specific things I did, but rather because I felt it was time that a woman got a chance to do this or that. We should do these things well and get on with the job, ensuring that these barriers in the future will be lowered—maybe not to zero, but lowered, anyway. I believe that the minority people are in exactly the same situation. The majority people tend to overlook minority groups because we don't look similar and because we don't approach things in the same way. It is true that we really don't approach things in the same way.

You think we look at things totally differently in the way we come at a problem?

Well, maybe it's that we don't take ourselves so seriously. I think that's part of it. We don't usually consider ourselves to be such important people. We don't expect a whole lot of attributions. We do various good things because they are the right things to do, or we're asked to do them. That could be part of looking at issues differently.

Maybe you have some insights. You're doing this study; you'll get a lot of insight. I believe that a student who has been here, maybe the biggest attribute that they get from MIT through this mentoring relation is that we try to look out for them for the long term. We try at least to establish the first or the second interface for them in their career paths. You give them the introductions and you tell them what's expected, and then they're off and running. If they do all that, I think they have almost equal future access. If you start off at a low level which is below your ability level, this is not a reasonable place for you to be, and then I think you have a hard time catching up later in your career. I think we have some obligation to try to start minority students off on the right level and with the maximum opportunities.

Well, I really appreciate your comments. You're quite a remarkable person, even though I'm sure you would not think so.

What I've done as a mentor is part of my job. Working with the black students has been remarkably rewarding. We get outstanding people in the majority population to come to MIT. The minority students are way up there in the very tippity-top of the minority group, I believe. They have such a high motivation level. They really want to succeed, and I believe that this thirst and hunger is a large part of why they do succeed. It's our privilege to work with them and to try to make them succeed better.

W. AHMAD SALIH

SB 1972 and SM 1974 (aeronautics and astronautics), EAA 1974 (engineer in aeronautics and astronautics) MIT, MS 1977 (biomedical engineering) University of Southern California, MD 1985 University of California at Irvine; diplomate, American Board of Emergency Medicine, 1995; technical staff, research engineer, and consulting engineer on aerospace projects with various companies prior to entering the medical field; emergency physician since 1987; currently with Anaheim Emergency Care Specialists Medical Group, Anaheim Memorial Hospital, Anaheim, California; and Whittier Emergency Medical Associates, Whittier Hospital Medical Center, Whittier, California; member, American College of Emergency Physicians.

I was born in Chicago in 1950. We stayed there just a few years. I actually don't remember much about Chicago, at least from my early years. We moved to Indianapolis when I was three years old.

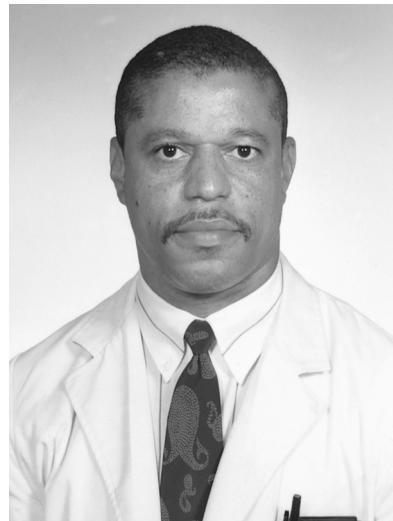

My parents, John Porter Dailey and Clara Dailey, were basically poor uneducated blacks from the South. My father was from Mississippi. Actually, he had finished high school and gotten about a year of college before he dropped out. My mother only had a fourth-grade education. My father had a number of problems—the main one was alcoholism—and in spite of his relatively good education for that time period, he was basically unemployed most of the time. We lived in a number of basements and shanty-type places.

Actually, my father was kind of a wild guy. One of my first memories of him was of me riding drunk at age three or four on the back of his motorcycle, and he was handing the caps of Wild Turkey—that's what he used to drink—back to me. Once he threw me in the river like some of the Indians used to do. He wanted to see—and I don't remember this, this is from my older brothers and sisters—if I had any spunk. I don't know what he was going to do if I didn't try to swim. Was he going to let me drown? I guess I must have tried, so he jumped in and got me.

But anyway, my father was a pseudo-hustler—that is, he wasn't very good at it. The problem was that he didn't work, and welfare was totally different back in Indiana in the early '50s. They didn't have the priorities they have now of trying to keep families together. In fact, they primarily tried to get more bang for the buck in

terms of their budget, I assume, so there was a lot of warehousing of kids. Our family broke up when I was five years old. Actually, what happened was that my father ended up burning down the place where we were staying. We were staying in a basement with a dirt floor and no bathroom. We had to go upstairs to the people that we rented from to go to the bathroom. There was one room, and there were five kids at the time. Later, my youngest brother and sister were born.

Anyway, after burning that house down, obviously we didn't have a place to stay and we started staying with my cousins. But they had a huge family. There were thirteen kids there. So with the five of us, there were eighteen kids and four adults, and that was just too big of a household. I had a lot of fun, though, because when you've got eighteen kids in a house, nobody can keep track of you and

Edited and excerpted from an oral history interview conducted by telephone by Clarence G. Williams in Cambridge, Massachusetts, with W. Ahmad Salih in Dove Canyon, California, 11 August 1999.

you can do pretty much what you want. We stayed there for probably about three or four months, and I guess it got to be too much. We ended up going on welfare. We were taken to a place called The Guardians' Home, which was an institution for homeless children.

My older brother Larry and I ended up going from there to a foster home. I lived most of my life with Mr. and Mrs. Hare. I called them "Mother and Daddy Hare." They didn't believe in calling men "Reverend," as "there is none reverend but God." Mr. Hare was a Protestant Holy Ghost minister. Anyway, he started out as the assistant pastor of the church—the Church of Living God, Pillar and Ground of the Truth. It was a little storefront church and had probably about twenty members. We used to go to church all the time, every day except Saturday and three times on Sunday. So I lived my early life in church.

We went there when I was six, in June of 1956. At that time, the welfare department didn't let you keep in touch with your family. My mother would come visit. For a while, my father came to visit, but after a couple of years, he stopped. My mother continued to visit every couple of weeks—that was the maximum she was allowed. It turned out that she ended up joining the church that Daddy Hare was assistant pastor of, so we used to see her every Sunday in church. But it was a number of years before I found out where my sisters were. I had four sisters, and they went to another home.

I stayed with Mother and Daddy Hare until I was eighteen. My brother stayed there until he was about fourteen. He had an incident with Mr. Hare, about whose turn it was to wash dishes, and he ran away from home. Then they sent him back to the Guardians' Home. Eventually, he ended up living at the foster home that my other sisters were at, at the time. They actually lived in many foster homes, I think four or five in all. For a short time, my two oldest sisters lived with my mother and father after he joined the Nation of Islam and straightened out his life.

I think that was one of the first big breaks of my life, the fact that I had a stable home life in spite of the rough beginnings. I lived with parents who loved me, and I could see the big difference between my life and how it has turned out versus my brothers and sisters. I later ran into them a lot when I went to high school. This was in '64, at

Shortridge High School. That was the second big break of my life. I look at my life as a series of lucky breaks. It kind of makes you believe in a divinity.

So I went to Shortridge. Initially, it was a predominantly white public high school on the north side of Indianapolis. The neighborhood was changing because there were blacks moving in. It used to be sort of a Jewish neighborhood, and they were kind of moving out in the '60s. When I first went there, it was probably seventy percent white and by the time I graduated, it was about seventy percent black. In the meantime, right about my sophomore year, the board of the Indianapolis Public Schools turned it into a magnet school. It was an attempt, I guess, to stave off the "black takeover" of Shortridge. But it didn't work.

Actually, you had to take a test then to get in because it was a magnet school. The good thing, and this is what I call a big break in my life, was that they had a lot of subjects that high schools don't normally have. I took two years of chemistry. Most high schools in Indiana had one year. Also, I had two years of physics and two years of calculus. They had languages, too. Besides the standards—Spanish and French—they also had Latin, Greek, Chinese, and Japanese. You normally didn't get those kinds of courses in a public high school.

The other thing I'd say was a big break was in terms of me taking advantage of those things, which actually is ironic. Let me go back a little bit. In junior high and elementary school, I was pretty much a rebel. I tried to be a bad boy. I was running around with all these guys and getting into trouble. But I always liked doing problems and I always liked puzzles, which sort of went from there to science and math. But the rebel part of me was that a lot of times if I didn't like a teacher, then I didn't want to "perform" for them. So I would do things just ass-backwards. I'd get every question on the test wrong, which, of course, is hard to do on a multiple choice exam unless you know all the answers. I used to do that frequently.

But in my grade school, in the eighth grade, they determined the valedictorian by this achievement test, not your grades. Even though I had bad grades, I ended up scoring the highest on the achievement test. So here I was, this guy with D's and F's, and valedictorian. They didn't know what to do, but they felt they had to go by the rules. That was probably a first.

One of my foster brothers, named Elmo, ended up dropping out of school at age sixteen, which was the earliest age that you could drop out. He joined the Navy and ended up going to Vietnam, but that's another story. One of the things he told me when I was kind of ragging on him about dropping out was, "Well, you're going to do it, too." He knew I was messing up in school and everything—it was not a secret. And I was basically telling him, "Well, I get bad grades because I want to—I don't have to." And he was like, "Yeah, right."

So in order to prove to him that I could get good grades if I wanted to, that actually is what turned my academic performance around. It was really trying to prove something to Elmo. This happened right around the time I was valedictorian of the eighth grade. I went to summer school and decided to really start trying. They let you double up in math. I took Algebra I and Geometry I at the same time. Then I basically doubled up each year, mostly in math and science, because that's what I liked. Of course, it didn't work out exactly as I anticipated, because of having all those bad habits from all those years of being basically a screw-up. There were bad habits I had to get rid of. My grades didn't go straight from F's to A's. It was sort of a gradual transition. I started out with C's and B's, maybe my first semester. And then there were B's and A's. Then after my sophomore year, it was pretty much A's. By doubling up on the math stuff, I was able to take all the prerequisites in math and science, so that I was able to take advantage of all those other courses that were offered by being a magnet school.

And I participated in a bunch of activities. I was interested in football and I played for a couple of years. I wasn't very good. I started out being a wide receiver, but I couldn't catch the ball. I ended up being a DB, defensive back, because I was fast. That worked out okay, but I never made the varsity. I wrestled for a couple of years. I did better in that and captured the city championship at 127 pounds (imagine me at 127 pounds!).

Track was my main thing. I ran for four years. Actually, a coach I had really helped out between my junior and senior years. We had a great track team. I ran the quarter. Since then it's been converted to the 400 meters. But I went from being the last man on the reserve squad to the first man

on varsity, because this coach worked us out with isometric weights and resistance exercises. Plus, he was really a freak about conditioning. We used to run around this big graveyard, which was like four miles—even the guys who ran sprints, the long sprints, like myself. Then he worked on our upper bodies, weightlifting in the off-season. I had never done off-season workouts before.

We did well. Our mile relay team and myself at the quarter went to the state meet. I actually got dusted in the state meet. I came in ninth in the quarter. But I won the city, the sectional, and the regional, and going to the state was a big accomplishment for me in track, coming from being on the reserve team the previous year and not even being on the list. Our mile relay went to sort of a tri-state meet with Indiana, Ohio, and Kentucky. Then we went to the Florida Relays because we had one of the best times in the country. I had gotten my time down to like 48.7, which was good for high school back then. Of course, some of these kids in high school I see out here now in California are running 46.

But anyway, back in '68 that was pretty good and I had sights on continuing my athletic career. I started running indoor track when I came to MIT. But then I got involved in politics.

You actually did exceedingly well in high school, as you mentioned. You were a National Merit finalist.

I ended up doing a lot of stuff. Actually, they used to call me "Mr. President" because I got into politics early. I was involved in a lot of different clubs, which sort of grew out of my academic interests. There was the Spanish club, math club, Mu Alpha Theta, which is like an honorary for math, et cetera, and I was president of all these things. I was also in music. I was in the band for four years, playing baritone/trumpet, in the orchestra on French horn, and I was in Thespians and in plays and musicals and all that stuff.

So basically, I knew everybody. By coming from a hoodlum background, I knew all the home boys. By being in football, wrestling, and track, I knew all the athletes. By being a nerd in calculus and physics, I knew all the scholars. And by being in the band and orchestra and Thespians, I knew all the musicians and actors. So politics was a natural progression, and that's why I was elected senior class president, president of the student council, and all that kind of stuff.

Was it Elmo you mentioned who was very influential?
In my starting to make an effort with my school work.

Were there any other role models or mentors?
The first teacher who really got me interested in learning—the discovery of the “aha!” and the fun and thrill of learning—was actually a math teacher in sixth grade. All the schools in Indianapolis were numbered, so that was School 41. That was Mr. Hormburger, I still remember him.

And there was a guy who was a science teacher in my elementary school. He was the same way. Just about six months ago, I read his obituary. A guy sent it to me, one of my friends out here in California. This teacher's name was Dr. Morton Finney. He actually had two Ph.D's and spoke about seven languages. It was amazing that he was teaching at an elementary school, but part of that is just the racism of Indiana in the '50s and '60s.

He was black?

Yes, and he actually was a teacher of my foster mother. We used to play all kind of games with Morton Finney, but he got me interested in science. He just died this last year at 109 years old. It was on the Internet that he was actually not only a teacher, but he spoke seven languages and he was an attorney (which I didn't know). I forget what his degrees were in, but Morton Finney was an amazing guy. Anyway, he was a mentor of mine.

And then in high school, Mr. Green, who was my calculus instructor, was the cause of me going to MIT. I had never heard of MIT. I was planning on going to the Marines, which gets into my political bent. I was very conservative in my outlook. I was going to volunteer to fight for my country in Vietnam. That was my goal. My brother actually was more of a radical. He had joined the Muslims. Coincidentally, my real father, John Dailey, had turned his life around during my high school years and had joined the Nation of Islam. Occasionally, I would go back and forth between Islam and Christianity, because of the church I grew up in. There were some occasional sit-ins and things back then. They were starting in '67 or '68. Some of the SCLC stuff that was happening around '64 with King, and so on, had hit Indianapolis. But I never participated because, like I said, I was very conservative. My brother Larry did, though.

I was more into all of my activities and academics, and Mr. Green persuaded me to apply to MIT. He didn't only persuade me, he filled out the application himself and basically just had me sign it. MIT was the only school I applied to.

Was Mr. Green black?

No, he was white. He later became the principal of Shortridge. I'm not sure what happened to him after that, because they closed the school down. And then after I got accepted, I had a choice to make—am I going to go to the Marines or am I going to go to this school, MIT? It was actually a girlfriend of mine at the time who helped me make the decision, because she basically said, “Well, you know, if you go to the Marines, you can't leave when you want to leave. If you go to school, you can come back and visit me or I can come up and see you.” And I said, “Well, that's true. Alright, I'll go to MIT instead of Vietnam.” That was my choice.

You had never seen MIT at all?

Never went there. I sort of got an inkling it was a prestigious university. Back in the ghetto in Indiana and many places, they have these people who sell life insurance policies and come around and collect every couple of weeks or whatever. The insurance man came by once and he was really pissed off. He was yelling and screaming to Mrs. Hare that his son had done this and that and had gotten straight A's. He had gone to a white suburban high school—I think it was North Central or one of those. Anyway, he was just mad. I remember him yelling, “My son got rejected from MIT—how did your son get in?” Mrs. Hare knew a little more about it, that it was basically an honor and an achievement if they accepted you. I didn't think it was any big thing, because I had never heard of MIT.

The other reason I decided to go was that the requirements for graduation, when I looked at them, were primarily math and science, which is what I liked. They were very lenient on the liberal arts part of it. The requirements were minimal, as opposed to other universities. I wasn't interested in history or English and all that kind of stuff, so I said, “Oh yeah, this is the kind of place for me.” Plus, I wanted to get away from Indiana. And that was basically how I got to MIT, with the help of Mr. Green.

Can you say a little bit about your impressions when you first came? I assume you did not come to Project Interphase.

No. Actually, that was one of the things we started after I got here. My class, the class of '72, was the last of what I call "the old school." There were seven of us blacks. There was myself, Warren Shaw, Richard Prather, Fred Johnson, Charles Andrews, Henry Cusick, and Harold Brown. The class after us, '73, was the first big class of blacks. I think there were seventy-seven or something, ten times as many. A lot of that was a result of the protests and the activities that we started. I was not involved much that first year, because I continued in my conservative trend. As a matter of fact, I joined a white fraternity, SAE. I lived on Beacon Street, "Fraternity Row."

Do you remember your impressions when you first got here?

My first impression was one of hard work, that it was like what someone told me later—getting a drink of water from a fire hose. I was used to basically skating in high school, the way most people probably were. The last two years or so of my high school career, I was getting A's primarily on reputation. I really wasn't working that hard.

But when I came to the Institute, I had to start working. It was actually good that that first year they started the experiment of not having grades for freshmen, having freshmen on the pass/fail system, because of the freshmen suicides that had historically been at MIT. Actually, they had the highest freshman suicide rate in the nation. That was not something they were proud of, but it was a fact. A lot of it was because all these guys were coming from private schools, with everybody being No. 1 in their high-school class. Then you came to MIT and all of a sudden you were average, just like everybody else. It was the same thing for me as far as an academic shock, because I was used to getting A's on reputation and working just very minimally. Then all of a sudden, I'm working my butt off and I'm getting C's. That was a shock and also a little threat to my ego.

But it was also, I think, a good thing in terms of me being in SAE, Sigma Alpha Epsilon. Actually, there was only one other black in that fraternity—Jack Anderson. He was a senior when I was a freshman. I never knew what happened to Jack. Anyway, they were sort of an academic/athletic fraternity. I

think they picked me because I was typical of their type. They didn't haze you as much as some of the other fraternities. They were more interested in everybody buckling down and getting a good background in academics, getting 8.01 and 18.01 under the belt—making sure that you got those things down pat, because if you didn't, when you got to the courses in your major, you were going to be stuck.

So it was good that I did get a good academic background that first year, and I didn't participate in much else. In January they had IAP, Independent Activities Period. The same girlfriend I was talking about—her name was Teresa—went to Indiana University. One time she came to visit me right before Christmas. All her hair was cut off and she had one of those little short 'fros. I was like, "My god, you're ugly!" But she got me to reading all of this black stuff. I remember reading *The Autobiography of Malcolm X* and *A Hundred Years of Lynchings*, which is a book that still tears me up—I found it again about a year ago.

That book got me so upset at white people in general that I started losing weight. I couldn't eat and I couldn't live in that fraternity anymore. I moved out. I disaffiliated. It wasn't easy to disaffiliate from a fraternity, because I had actually "gone over" and become a brother, a member. But it was like February of that year, after our pledge class went over, that I just said I had had enough, and I disaffiliated from SAE. I went through the national, went through all the paperwork that was necessary to get my name off all the rosters. It was so ironic because SAE, even though they were very academic and athletic and all this stuff, had really helped me.

But when I went through that, after reading all that stuff, *The Autobiography of Malcolm X* and the lynchings and all the other stuff that happened in black history, I spent my whole IAP doing that—reading like three books a week. Then I was about to go through the initiation ceremony, where the SAE hoods—I shouldn't probably be telling anybody this, because the ceremony is confidential—looked just like the Klan's. There we were wearing the Klan hoods. I mean, we didn't have a burning cross, but that image was painful. I said, "No, I've got to get out of this—I cannot do this."

So I disaffiliated from SAE and ended up moving in with a group of guys on St. Botolph Street. I moved in with three black guys—Henry

Tucker, Michael Hicks, and Stephen Carney. They were all from the class of '71. We moved over on St. Botolph Street, which is about a mile from the Charles River. Then I went back to Indiana that last summer and stayed with Mrs. Hare and them, and that was the last time I went back home.

Then my sophomore year, I started going to BSU meetings. I remember Shirley Jackson was the president and Alan Gilkes was like the recruiter. Alan was always buttonholing people, walking through the halls. He'd see somebody black and tell them to join the BSU. So I went to a couple of meetings, and that was when I started my involvement with the BSU.

And then it really mushroomed. I came back early that summer from Indiana. I worked at Eli Lilly that summer and I couldn't deal with the restrictions of Ms. Hare's house—she was too conservative—so I had to live on my own. When I went back to MIT, I still stayed with Tucker, Hicks, and Carney, and started getting involved in black activities, both on campus and off. On campus, we really did a lot of stuff that second year. There were takeovers at Brandeis, Tufts, and Harvard, and we had the big takeover of the Faculty Club at MIT. By that time, I had become the co-chairman of BSU along with Warren Shaw, who was my roommate.

It started out, actually, that we had gotten involved with SOBU—the Student Organization of Black Unity—that had been formed the previous year. There weren't that many black students at any of the schools around the Boston area, so we decided to kind of work together and take on each institution. There were representatives of each school in SOBU, even though it was dominated by Harvard and BU because they had the biggest black populations. But everybody was sort of represented, from Tufts, Brandeis, Wellesley, and BC—even farther away, Smith, Vassar, Holyoke, and Brown. I was the unofficial MIT rep to SOBU.

We started attacking each school individually, and Brandeis was the first. First, we started talking to the administrations of each school and getting together to compare notes about how our discussions were going. Basically, the discussions mostly involved getting black studies, getting more black students, getting blacks financial aid, more black administrators, professors, et cetera. This was in '69 and '70. Most of the administrations talked to us, but they weren't moving fast enough for us. That's

when we decided to take a more proactive stand. We weren't in the mode of demonstrating. We wanted to put some pressure on them—I mean, as far as picketing, or sit-ins, or teach-ins—like the white students were doing, about Vietnam. That previous spring we had seen the first building takeover by blacks at a white institution, and it made the cover of *Time* mainly because of guys carrying shotguns. That was at Cornell, and we had a couple of representatives from Cornell come talk to us at SOBU. And we said, "Why not here? Hey, let's take it to the stage."

So that's what we did at Brandeis. That was the first time we actually broke into an administration office, using physical force. They let all the secretaries and other people go and held the higher-ups hostage. That became a prototype for the way we'd do it at each school. Students who actually attended a particular school would do the breaking in and the hostage taking, et cetera. We tried to make sure the president, chancellor, or some senior administrator was there to hold hostage.

When we finally did MIT, which was the following spring, we did it over at the Faculty Club and at a time when they had a meeting of the Corporation. There were a lot of important people there. It was February or March 1970, something like that. Howard Johnson was the president, and he was there. Wiesner was there. Paul Gray was there. He was the chancellor then and later became president. There were a lot of other people who were members of the Corporation—Du Pont, the president of U.S. Steel, the governor of Puerto Rico. We held all those guys hostage for about two days. The people from the other schools would provide support, meaning food, communications, and a show of force. They would stand out front and they'd have their shotguns and everything for the TV cameras.

At that time, we had expanded our focus from just student activities to community concerns: unemployment, police brutality, and so on. At MIT there was a disagreement going on at that time between the kitchen workers over at the Faculty Club and the administration. I forget, really, even what their issue was. It had something to do with the pay scale and also with working hours and not being paid overtime—stuff that was really, frankly, illegal, even at that time under the labor laws. But MIT was getting away with it. So

we said, “Hey, we’re going to support them.” We wanted community support for our academic demands and we felt it was only natural that we should support the community, especially the workers in our own institution.

So basically, we took over the Faculty Club to support the workers. It was almost kind of like Martin Luther King and his group, when they went down to support the garbage workers in Memphis, where he was assassinated. We were supporting our workers over at the Faculty Club. We issued our academic demands along with their employment demands.

It was a surprise and a shock to the administration. Then we went into negotiations and we got most of what we wanted, even though later MIT rescinded all of them. We wanted full financial aid, regardless of need, for all black students. We wanted the ability to take courses at any university and get credit for it in your major. We wanted the ability to hire and fire professors, the ability to have a board—and we later actually even got this—composed of half students and half administrators and former students, with the ability to forgive loans for black students. We wanted to be able to interview and have a representative on the admissions committee, because we wanted a say in the type of black student who would come there. We wanted to have a voting member on the admissions committee. Surprisingly, we got all of that.

What kind of student did all of you feel would be the kind of black student you thought should come to MIT? We had many discussions about that. At this time the goals were changing so fast, almost month to month. At first we were just interested in ourselves, in terms of getting more black students, black studies, and sort of the whole Boston black student community being able to interrelate. We were in communication with a lot of black students from other universities. There weren’t that many, and we found out that we were all grabbing for the same people to be administrators and to teach black studies courses. I remember Hayward Henry used to come and teach at MIT, but he was also teaching courses at Harvard and at BU. We said, “Hey, why should we run Hayward Henry crazy? Why shouldn’t he just be able to teach one course at one school and have us all come to one place and then get credit for it in our own universities?”

It went from that kind of thing to the hiring and firing of professors. If they didn’t support the

students or if they were abusive, we’d want to get rid of them. The goal, of course, was to try and change the black community and be of service to the black community. So we wanted people who were academically strong, but also who were activist-oriented and interested in politics—local, national, international. Of course, we’d have the typical fights between violence and non-violence as far as tactics and things like that. We didn’t care what side of the argument you were on as long as you were involved.

There were always the factions. There was the faction that supported the Panther Party and the RNA, which I later joined—the Republic of New Africa. The RNA was one of the separatist organizations. Then there was the non-violent religious faction. There was a big Christian movement at MIT. Some later formed the Gospel Choir et cetera. Then they affiliated with local black churches and started having services here. Some even later became ministers, like Lyman Alexander and Paula Waters. They were primarily proponents of Martin Luther King’s philosophy of non-violence, as opposed to those of us who believed in Malcolm X’s philosophy, of not turning the other cheek and of fighting fire with fire.

So we were trying to integrate all of these viewpoints. The whole idea was that, as a BSU, we would not align ourselves exclusively with any tactic. The whole idea was to get the job done by any means necessary. Whatever tactic would work, that’s what we were interested in. So we were not going to align ourselves with the Panther Party, SCLC, NAACP, or any other group. But we wanted to support students in these organizations in activities that we thought would help the black community. We wanted students who would be active in whatever they believed in. In fact, I probably would have written myself off, because here I was, a conservative—I mean, the way I was in high school—young black man coming to MIT, certainly not interested or active in politics at all. If I had interviewed myself two years earlier, I probably would have rejected myself.

I would bring that up sometimes at a meeting, that you can’t tell how a person’s going to be at twenty by interviewing him at seventeen. I remember Sam Denard. He came in just like me, very conservative and not interested in politics, and later became one of the more dedicated student activists. My view was that we shouldn’t

exclude anybody, because these were people in their formative years and you were not going to be able to tell who was going to be an activist. My feeling was, “Hey, anybody who’s interested, let them come—we should just try to help them as much as possible.”

I think that was some of the discussion that later produced Interphase. We got a lot of people in in 1969, the class of ’73. MIT pretty much let us do what we wanted. The admissions committee was trying to get as many blacks as possible, usually those at the top of their classes. But they weren’t screening them very well. Then when they got to MIT, everybody started getting all of this political activity. Plus, there was all the social stuff—you know, parties everywhere, all the time. Basically, they didn’t get a good academic background the way I did at SAE.

So I think of that seventy-seven, only twenty-two graduated on time. We just realized, after that first year, that a number of them were getting incompletes in their courses. We started a tutoring program which I got involved in, and then we worked with the administration and created Interphase to help with the transition. I think that was the first year of Interphase, ’70. I was actually in charge of social activities for that. I had sort of gotten a reputation of being a partier.

Your group really paved the way to develop all of these programs that are here now.

One of the guys I have to pay tribute to is Fred Johnson. I’ve lost track of him. A few people I’ve run into since that time have tried to find him and have not been able to. He’s one of the guys who actually was involved my first year. I think he paid probably the biggest price. He and Shirley Jackson co-chaired before Warren and me. With all the meetings and everything he was going to, he ended up not finishing school and he didn’t come back. Fred was certainly an intelligent guy, brighter than a lot of us, but basically he sacrificed his career for the black student community at MIT.

There were a lot of people who paid a high price. For myself, it’s kind of like I was willing to sacrifice and I would do my activities, but on Friday night or Saturday night, I’d go back to my room and I wasn’t going to let my grades slip.

You were a politician, but you also knew you had to get your work done, right?

Right. I did all that. Then, I guess, the other big

part of my early MIT years I was on the radio. We started that. It used to be called WTBS. I don’t know what its call letters are now. I heard they sold the call letter rights to Ted Turner because of the conflict with the letters. We started out as just a half-hour radio station, once a week. I had the first show. I was the DJ and I got my first class license from the FCC, and I was the first “Ghetto” engineer.

Then JC, James Clark, came as a freshman in ’71, and he was really active in it. We ended up forming “The Ghetto.” We named it after Donny Hathaway’s song. We went from one half hour once a week to taking over the station eventually. We were all night, seven days a week. Bose, the guy who makes all the speakers, was our faculty advisor in Course VI. We got a lot of electronics hands-on from him. There was another guy—we had a lot of people help us along the way—who was on the board of MIT, the Corporation, and also on

W. Ahmad Salih deejaying for the “Ghetto” radio station. Photo: Margaret Foote

the board of the FCC. He got our antenna raised and got us more power, so then we were covering all of the Boston area.

We became like the No. 1 station in Boston—I mean, black, white, everything. Everybody listened to us. When people would come to Boston—entertainers like Aretha Franklin, War, Kool & the Gang, Stevie Wonder, the Jackson Five—they came down to “The Ghetto.” There was Richard Pryor, Isaac Hayes, and jazz stars like Al Jarreau, all these guys. Everybody listened to “The Ghetto.” We were the No. 1 black station in Boston for a while. We used that vehicle to sort of help in uniting the black community. It’s kind of like if you had any event that was going on in Boston that was black, then you had to get it on “The Ghetto,” because everybody would hear it.

When people would come into town, a lot of times they would want us to emcee. I remember we had a concert featuring War. Dave Lee, who was in the class of ’74, formed a band named Emissary Blaque. I was a semi-musician, but actually I was singing and playing congas. We played warm-up at different concerts in the Boston area and at school parties. I remember we sort of had a thing with War, because we played warm-up with him at a couple of concerts. Then there was a concert with Aretha Franklin and with Earth, Wind & Fire where I emceed. We’d earn money that way, on the side. But for actually working at the station, we decided not to pay ourselves.

Then there was the tutoring program and all of the political activities. I also got involved my sophomore year with RNA, the Republic of New Africa, after I quit the Black Panther Party. That’s where I got my name. I actually didn’t mention that, but the name I was born under was Milton David Dailey. I guess my first year, when I lived over on St. Botolph, they started calling me Ahmad, which means “praiseworthy.”

Let me back up a little bit. The RNA was a group that believed in revolution, as opposed to reform. They believed the Malcolm X doctrine that the problem with black people in America was that we lacked the power to control our lives and that the only way to get that power would be to do the same thing that George Washington, Thomas Jefferson, John Quincy Adams, and all those guys did: to declare ourselves independent and form a nation, and then to wage war to defend our independence. In terms of the Malcolm X

doctrine, we believed that, as black people in America, we couldn’t go along with either, say, Martin Luther King’s SCLC policy, protesting in a non-violent manner—we didn’t understand the spiritual power of non-violence—or even people like the Black Panther Party. Even though the Black Panthers had guns for self-defense, they still were asking for the same things that Martin Luther King was: reform, that is, a piece of the American pie—better jobs, housing, educational opportunities, end to police brutality, and so on.

But the position of the RNA was that we didn’t want to get jobs at General Motors, we wanted to get our own General Motors. We didn’t want to have equal access to educational institutions like MIT, we wanted to create our own MIT. And even on a higher level, we didn’t want the federal government to give us programs such as Title IX and Head Start and all this stuff, we wanted to create our own government. We were going to take the Five States in the south, where most black people live, and have a plebiscite monitored by the UN, similar to what they had planned in Palestine in the ’40s. That grew out of the Zionist movement and the subsequent violence in the region between the Arabs and the Israelis. The British basically tried to wash their hands of it and hold a plebiscite to let the people decide, in that area, who they wanted to be governed by.

That was our goal, to eventually cause so much rioting and violence and everything—blowing up power stations and buildings and just creating chaos—to make the area non-governable, and then eventually have a plebiscite which would be monitored by the United Nations. Surprisingly, we got a number of people to listen to us, mostly Eastern Bloc and Non-Aligned Countries that despised the U.S. and its practice of talking democracy while supporting dictators. We had a non-governmental seat at the UN. We talked to representatives from China, Russia, Cuba, Libya, and so on. As a matter of fact, a couple of times, when we got arrested after some of our building takeovers, different foreign delegations would bail us out of jail. So we thought we were hot shit. It’s like we had taken on MIT and Harvard and Tufts, et cetera, let’s take on the United States and the world.

Who else other than you was in the RNA?

There was Balaghoun (Howard Meekins), Hakim (Henry Tucker), Henry Cusick, and a few more.

I'm talking about MIT students who were in the RNA. There were Tucker, Hicks, and Carney. Tucker was Henry Tucker. He changed his name to Hakim Amir Abdallah. Meekins was in the class after me, '73, and he changed his name to Oba Balaghoun Ali. And then there was "Memphis," Frederick Douglass Williams. He joined, even though he was not that active. Then some of the other guys joined from over at St. Botolph Street. I remember Ron Johnson. He was actually on the other side. He joined the Panther Party. I was in the Party for a summer, but then I got out of the Party and joined the RNA.

You guys were radical.

I wasn't really that much into the Communist philosophy. I thought the main problem we had in America was our skin color. In terms of who was the "we" that was oppressed, it was more on a racial basis than on an economic basis. But yes, some of us really got radical. We used to go out in the Blue Hills and practice taking apart our weapons and everything, preparing for the revolution.

You were the co-chairperson of BSU at the time. You were very outspoken, if I remember correctly. I got really tickled when I read this statement in The Tech that you had written to the MIT administration. Do you remember what you said?

No, I don't remember that statement.

Basically, what you said was that the administration was not moving fast enough for you.

We wanted everything now. We weren't willing to wait on anything.

You told the administration that they needed to get off their ass and do what you told them to do. I have this quote out of The Tech. It's so different from a student I would see today. They really need to understand that we had some students here who really said what they wanted to say and did not waste any words.

I think it was the climate of the times, too, because even the white students were very radical at that time. One of the main problems we used to have was trying to keep the SDS out, the Students for a Democratic Society. Their primary focus was ending the war in Vietnam at that time. They wanted to support us, and when they got wind that we were going to take over a building and hold some people hostage, et cetera, they wanted to help supply us with ammunition and food and things like

that. We were also pretty sexist at that time, because the women prepared us food and the guys were on patrol outside.

But SDS helped us. We ended up finally saying, "Okay, you can help us by creating a diversion." They ended up having a big demonstration over at the Instrumentation Labs, protesting the war. They broke in there with a battering ram, which resulted in a lot of police going over there. That allowed us really easy access to the Faculty Club. We took it over and held the Corporation members and administrators hostage. Then SDS came over with their demonstration and marched outside in support of the BSU.

We held them for about two days. Even the white kids were radical. I remember when SDS broke into President Howard Johnson's office. When Ellsberg tried to publish all this secret stuff about the CIA, and then the CIA went to court to try to prevent him from publishing it, the reason the Supreme Court voted that he be allowed to publish it was because all the stuff that he was going to publish had already been published. It had been published by SDS in the MIT Press, after the white students had broken into the president's office and ripped off his files.

That was a crazy scene. Those four dudes were wearing ski masks and tennis shoes, but otherwise buck naked, and using a homemade battering ram. Those were wild times. I remember one of the things that Nixon's boys were doing was trying to stop Ellsberg. That's why they broke into his psychiatrist's office, in an effort to get info on him. That was part of the thing that brought him down—that, plus the Democratic headquarters break-in at the Watergate Hotel in DC.

But anyway, backing up, there were factions, of course, in the BSU. Even though I was part of the radical faction, the black nationalist/separatist faction with the RNA, I think the reason they elected me was because I was not dogmatic and was able to communicate with people who didn't believe like I did. I could see different sides. Similarly, I guess, to my political beginnings in high school, I was accepted by a lot of different groups. I was with the Party, I had the band, and was with the radio station. I was also with the nerds and with the tutoring program. I was with the athletes, because I was on the track team freshman year and played IM football, both with SAE and then later with the BSU.

Doing all those things you were doing, how did you do academically?

I ended up with a 4.3 grade point average—5.0 is an A at MIT. The tutoring program helped me. During my running around, it was kind of like I found I had to go back and learn some of that stuff in order to tutor. Also, in tutoring different people, you have to explain things. Basically, I learned a lot of subjects at MIT by tutoring them. That helped me when I went to my upper division courses.

I ended up in Course XVI, aerospace, and that was sort of a fluke. I was an undesignated senior and that was the only subject I could graduate in on time. That's how it happened. I had switched before. I started out in Course V and then, after taking 5.01 and 5.02, I said, "Oh no, I am not going to take chemistry." I was going to go to do Course XVIII, then I went to Course VI, and then I went to Course II. I even took two courses over in Course XV at the Sloan School. I was taking this and that. The only thing, it turned out, in which I could graduate on time was Course XVI. By the time my senior year was coming around, I'm like, "Oh man, I'd better think about graduation here and declare a major." When I started looking at the different courses, I had taken a little bit of this and that. That's basically what aerospace is. Now they've sort of compartmentalized Course XVI, but back then their major requirements were so varied.

Then I ended up staying there and basically getting my SM and EAA degrees. Automatic control was my main thing, and guidance and navigation were an offset of automatic control. Then I started working over at the Mann Machine Laboratory, which was part of Course II, and I did a thesis over there. And that actually led to my first job after I got out of college—at GE doing finite element analysis and programming the modes of vibration of a twisted blade, designing jet engine compressors.

You've done a lot of things since you left MIT, and ended up in a totally different profession than what you were trained here for. When you look back on it now, what would you say was best about your experience at MIT and what would you say was worst?

I'd say the best thing was really just being lucky enough to come to Boston at the time I did. It caused me to begin my life of introspection, which has really been a large portion of my life, and also

of community service—even though at that time, like I mentioned before, I pretty much had a black/white view of the world.

You mentioned something before about a letter or statement I had sent to the administration. We had a lot of discussions that would go into all of those communications or communiqués that we would give to the outside world. Even though I might have been the spokesman, most of those things were agreed-upon. How I would say them was kind of up to me. Those discussion groups that went on—both discussion groups with the SDS and talking about the philosophies of non-violence, violence, the goals, "separate nation," equal opportunity, this kind of thing, the tactics, et cetera—encouraged me to basically gain a good political education in terms of not only the black struggle in America, but expanding to the struggles in Africa and the Middle East and in the Far East, in China and Ireland and Central America. So it sort of started my political education, and I continue to be interested in national and international politics to this day.

Also, I guess I didn't realize it at the time, but my last name—Salih—was actually given to me by the Minister of Defense of the Republic of New Africa, Alajo. He called me Salih because I guess he saw something in me that I didn't see at the time. Salih means "righteous," and at the time I was an atheist. I'm like, "What?" Now that I look back on it, I could see that, because even though I was involved in all these activities, every time you saw me, I was always carrying around some religious book, whether it was the Bible, the Bhagavad Gita, the Koran. That was like an avocation of mine. I was always studying religious thought, not just because I could see that great leaders from different parts of the world always had a philosophy to guide them and give them the inner strength they would need to withstand daily trials, but because I had an inward drive to know the truth. Perhaps that's what Alajo saw.

My search for that higher power, for that inner strength, had started out a little earlier. I mentioned that my real father converted to Islam when I was in high school, and yet I grew up in the Sanctified Church. Mr. Hare later split off from that church where he was assistant pastor and became the pastor of his church. So I was going back and forth between the Temple Islam and the Sanctified Church, Christianity. The big question

in my mind was, which was the right religion? Later, I branched out with people we met from different countries and different religions. I started studying a little Buddhism and Hinduism, and so on. That's how I got the name Salih.

So the introspection came from both my political involvement and my own private study that was going on throughout those years in terms of religion. At the end of what I thought was my first study, the four years or so at MIT, I sort of concluded that there was no God, that man had made him up in order to explain things he didn't understand, to answer the questions that were unanswerable—such as, Where was I before I was born?

Actually, I discovered God for myself in the late '70s, after I had left MIT. Ironically, I discovered him when I was up at Stanford and I was gambling. I got into backgammon. I used to go up to San Francisco and play in these tournaments, and occasionally in the big tournaments in Vegas. I discovered the power of belief, mostly by way of the dice. Initially, I used to play a very scientific game. I knew all the rolls of the dice and I knew the probabilities of various situations. That's how I played my game, and I did pretty well. I would usually get to the finals of most tournaments. I'd never win, but I'd beat most people.

Then one time in Vegas, I ran into this guy who was talking about how you could influence the rolls of the dice with your mind, the power of the mind. I thought, "Aw, that's bullshit, but I'll try it." I'd try anything. By trying that, even though I ended up with a slightly different method than his, I did discover the power of belief—and this was something I wasn't taught at MIT. I discovered the power of the mind. And then later on, I went back to my studies of Buddhism and Christianity and found that that's what they were saying—that the power of belief works not only on dice but it can work on life in general.

That was one of the things that shaped my later life. I discovered the power of belief and the power of letting go. From my initial ventures into religion, world religion, first I was trying to find out what was the "right" religion. Then later, I began to say, "Well, what if all of them are right, but perhaps incomplete?" It's almost like some Christian ministers would tell this parable of the blind men and the elephant. There were apparently four blind men and they were trying to describe

an elephant based on how it felt. One would touch the elephant's side and say, "The elephant is like a wall." One would touch the tail and say, "The elephant is like a snake." One would touch an ear and say, "The elephant is like big leaf." And I came to the conclusion that basically religions were like these individual blind men trying to describe God, which was not something they could fathom—it was beyond the power of the mind.

Therefore, what I was trying to do was find the commonality between all of these religions, and I found that it was letting go. If you're a Christian, then you believe in God with all your heart, soul, and mind. You give all of your love and faith and devotion to God, and when you pray, if you really believe, you let it go. And it's the letting go that creates.

That's what I discovered by rolling dice. If you are a Buddhist and you believe that all of this is an illusion—that really there is no self beyond the thought and that this is really kind of like God's play, it's like a dream—then of course you let it go, because it's not real anyway. If you are Muslim, and Muslims primarily believe in total submission to the will of Allah, then of course if you totally submit, you have to let it go. Of course, there are devout people in every religion and there are hypocrites in every religion, but I'm talking about the devout ones. If you truly believe in Islam, then you submit to the will of Allah and you have to let go. In terms of your hopes and your dreams and your aspirations, you have to make them secondary.

That's what I found was the commonality. By learning to let go in life, it has transformed my life. That started at MIT, my fascination with politics and my investigation of the divine.

I stayed at MIT till '74. I was a house tutor over at McCormick. September of '74 is when I left, and I stayed in Boston for another year, working at General Electric.

You stayed in the area quite a long time.

Yes, from '68 to '75. After the whole political thing at MIT, it came down to personal things, which it always does—how am I going to be of service to the black community? Later, my focus started to enlarge to basically people who were the have-nots in this world, not just black people. Actually, I don't believe in race anymore, but that's another story. I saw a sign on a DC bus last year that said it best—"Race is an illusion, racism is real."

Anyway, there was a group of guys whom I met through a conference of the Black Engineers. They were connected with the Sixth Pan-African Congress, which was held, I think, in '74—it might have been '73—over in Dar es Salaam. Out of that, there was a group involved in science and technology, and the idea was to help emerging countries—primarily black, but also Caribbean and Central American countries—gain independence from the Eastern and Western powers, because they realized that both the United States and Europe were using them for their natural resources and also for their labor. The Eastern Bloc was doing the same thing, and they wanted to gain control over their own countries. As these countries were getting their political independence, they also wanted to gain their economic independence. They found that what they needed—where we could come into play, or we thought we could—was our providing them with technical support and technical expertise.

So they formed a group called the Skills Bank, and the idea was to work for a minimum two-year stint in a developing country and provide them with technical expertise. We were kind of politically naive. We didn't realize there were a lot of forces over there who didn't want us to succeed. We were getting sabotaged, we later found out. I put in an application to go to Tanzania, when I got out of MIT in '72. My going to graduate school was a delaying tactic to avoid a 9-to-5, because while I was waiting on this application to come through, I said, "Well, I've got to do something, and I don't want to go out and work."

That's how I ended up getting my advanced degree. But it later turned out that there were people over there working with Alcoa and Reynolds Aluminum—there's a lot of bauxite in Eastern Africa, which is used in the production of aluminum—and sabotaging our whole project. They didn't want us to come. They were getting paid by Reynolds, and if we came over there and were successful in establishing an aluminum manufacturing facility that was independent of Reynolds and Alcoa, then they would be out of a job. They were wise enough to realize that, so they were trying to sabotage our projects. We thought people on the other side were trying to help us, but in fact, a lot of them were screwing us.

That project never got off the ground. There were a couple in West Africa, a couple in East

Africa, and then the whole politics in Central Africa. We had a lot of good ideas. Also, in terms of ourselves, a couple of people who did go over there—not only were we politically naive, we were not, I think, technically ready. We were essentially young guys who had just gotten our degrees. But you don't know enough to teach anything if you just have an education. To be effective, we needed some experience as well in what we were doing.

But the bottom line is, I ended up working at General Electric in Lynn, Mass. I was in the aircraft engine group doing vibration analysis, computer programming mostly, doing finite element analysis on a twisted blade. I designed compressors. I did that for about a year and a half, and then I said, "Fuck this." I felt like I was helping the enemy, because I was working on military aircraft that were being used to support governments like South Africa, Chile, and Nicaragua that I totally did not agree with—or dictators around the world that I couldn't see helping, even though I didn't see a way at that point of stopping them.

I was trying to figure out how to change my career—and this is actually the Buddhist part of it, in terms of the eight-fold path, to make your livelihood reflect your values and not just be a method of earning money to survive. That's when I decided to go back to school, and I went to Stanford in '75-'76.

What did you have in mind when you went to Stanford?

Well, I still liked automatic control, but I was going to use it for medical purposes. At that time, we thought biomedical engineering was the wave of the future. That turned out not to be the case, but that's what I was going to do—biomedical engineering. I would still be able to use my automatic control/computer science background, as well as my jack-of-all-trades kind of thing—a little electrical, a little mechanical. Then I'd add some physiology to that and do biomedical, and hopefully work with some type of industry that was trying to help people instead of trying to kill them, which was pretty much what I was doing with the military, by working with different industries that supported the military, like GE.

It later turned out, after I got my master's from Stanford in '77 and went down to USC to complete the Ph.D., that I ended up dropping out of there after a year. I never completed that Ph.D., mainly because I could see that all the guys who

were finishing in biomed were going back to teaching, or they were working in some hospital just in procurement.

I had a lot of ideas for different projects, and I was trying to get some support. I was writing applications for grants to the National Science Foundation, National Institutes of Health, and all those places. See, I wanted to become independent so that I could pursue my political objectives. But, of course, I needed to get financially independent. I wanted to still work at my own speed, work in my garage and come up with stuff and get some grants to support me while I was doing this. Maybe I would come up with something, get it manufactured, and make a million dollars.

That was my plan, but I kept getting turned down for these grants. I had made some contacts at NSF and with some of the people in DC and in New York, and was trying to find out who was getting these grants that I kept getting turned down for. I found out they were people who had both the engineering background as well as the medical. That's how I ended up going to medical school.

Actually, I was in a big quandary then. That was at the end of my time at Stanford, which was in '77, and Sam Denard, MIT '74, was recruiting at that time for NASA. They were looking for a black astronaut. That's how he got Ron McNair. He had come to MIT, and basically they were looking for black astronauts. They wanted somebody who was physically fit and who had at least a master's in engineering. Basically, I fit the bill. But the problem was that you had to join the military, and I said, "Oh no . . ." But Ron joined, and everybody knows what happened to him. Mae Jemison was a sophomore at Stanford at the time, and we were all recruited at the same time.

I almost went in that direction. I said, "Man, that would be a trip, to go out in space." But I decided instead that I was going to go ahead and try to do my independence thing, and try to continue with my political ideas. So I decided to stay with biomedical engineering, and went down to USC instead of going to Houston. If I could have done it part-time, I would have done it.

Anyway, my biomedical career never worked out, because I found out that companies who manufacture biomedical equipment don't want a jack-of-all-trades guy like me. In the back of their mind, they were interpreting that as "jack-of-all-

trades, master of none." The way they manufactured the biomedical equipment was that they would create a project team, usually consisting of an electrical engineer, a computer scientist, a physiologist, and a mechanical engineer. Then they would design this thing, make a couple of prototypes, and try to sell it. But they didn't want one guy to do the entire design.

I wanted to get a grant to work on different projects, so that's why I went to medical school—to enable me to do that. In the process of going to medical school, I surprised myself and became interested in medicine. It seems ironic, when I think about all the stuff in my background that led me up to that point. It turned out to be the perfect career for me.

In medicine, I started out in general surgery. I did that a couple of years, and then I started working in the ER. That's what I do now—I'm an ER doc, an emergency physician. I've been an emergency physician for over twelve years now in Southern California. I work right now at a hospital in Placentia, which is a small suburban hospital. Then there's another one, Anaheim Memorial. I'm an independent contractor, so I work around. I also work for the sheriff's department at the jail. Anaheim Memorial is a little bigger hospital, sort of in a changing area. It's sort of a Hispanic area and there are a bunch of freeways, near Anaheim and Disneyland. You get a lot of the gang violence and auto accidents, and because the Hispanic community is relatively young, you have a lot of obstetrics and pediatrics. Also, you get a lot of elderly people with various medical problems.

But working in ER, I think, allows me to use my math, my science, my spirituality, my ability to talk to people from various backgrounds, and my need to try to be helpful to people. I couldn't have planned it better.

So in your striving to be independent, you ended up doing that.

Yes, and also at the same time making a contribution where I can help people. I still am involved in activities on the side. I work with a group, AAP-SOC, the African-American Parents of South Orange County. Incidentally, I am a parent. We have two kids and my wife and I have been married for eleven years now. I have a son, Kyle, who's eight and a daughter, Nicole, who's five. Plus, I have two older sons from back in my MIT days. Shawn is twenty-eight and Paul is thirty-one. As a

matter of fact, Shawn just got married last summer. He's in Virginia and he's trying to become an investment analyst. Naturally, I turned him on to my classmate Warren Shaw, who worked for Citicorp for twenty-four years before he went independent and got his millions. I just saw him. He ended up marrying Inez Hope, MIT '73, one of the women who was one of my residents when I was house tutor at McCormick.

My oldest son, Paul, is in Indiana and he's a real estate broker. He was not the academic type. He started at Indiana University and ended up dropping out, doing this and that. I guess he did sort of inherit that from me. He was doing catering for a while, this and that, and he finally got into real estate. I can see a little bit of the different sides in my two younger kids. Nicole will be six in October and Kyle is eight. Nicole is the athlete, very protective and the "mother" to all of her friends—just like her mom. Kyle is the thinker and the artist, and also sensitive. He's a performer, actually, and that was always part of me.

When I look back on it, not only did MIT open a lot of doors for me, it also gave me the ability to think rigorously. That's applicable not only to science and engineering, but to life in general.

Overall, you're saying that you feel very positive about your experience?

Oh, yes. I think my years at MIT, when I look back on them, were one of the highlights of my life.

Of all the things you've done?

Yes, of all the things I've done, the years at MIT were the highlight of my life. It has shaped my life. The things I started back then, I didn't necessarily finish them, but when I look at what are the important things in my life now—what I like to do—MIT was the motivator. Well, the family part was not, because I was spending my time in those days running around with a whole lot of different women. But in a sense that was instrumental too. I was married then for about ten months. I did that running around, and it helped me get that out of my system and be comfortable with my manhood. I think in some ways a lot of guys who end up getting married and running around and messing up their families, it's their alter ego and they haven't gotten that part out of their system.

The political things I started back then I have carried on to this day. I'm still interested in the struggles that are going on around the world, and I

keep track of those things. I'm working with two groups right now. I mentioned AAPSOC. It's suburban—this is Orange County, John Wayne/Nixon country. That's where I live. But there are a number of black people in this area too, and we try to keep them together both at a political and social level. Then there's a group called Adopt-A-Neighbor that I work with. Basically, we provide food and free medical services or referrals to the poor people and the homeless. That's what I do now.

I also meditate. I've been practicing TM, transcendental meditation, for about twenty-four years now. I try to keep my mind empty, alert, and active. It has to be clear when I work in the ER. People get wild and everything's hectic, and there are screaming patients, families, and nurses and everything. I try to keep my center to keep calm and to keep my priorities straight—life and death before pain, before fear, before economics—and to try to keep my ego, but not my emotions, out of it.

Based on all the experience you've had since your Institute days, what advice would you give to a young black student coming to a place like MIT for the first time?

I would say to basically follow your "druthers," follow what you would rather do at any particular time, but realize that it's going to change. A lot of people, maybe because of influences from parents and friends, come in as a freshman and say, "I'm going to be this," and then they feel an obligation to stick to it, even though their interests change as they get exposure to this and that. I'm saying, go with those changes—whatever you're interested in at the moment, do that. What you will end up doing may not be what you had planned, but it's what you should do. I think everyone has a purpose in life and there's no way for us to know that in the beginning, or even at the end sometimes.

This is more in keeping with my philosophy of today, of trying to live for today—live one day at a time, instead of spending so much of your life in the future or in the past. And put a hundred percent of yourself into whatever you're doing at that moment. If you are trying to do a problem set in 5.01, then put yourself a hundred percent into that problem set. The same if you are listening to a lecture. If you're out at a party, then party a hundred percent—don't be thinking about the problem set, let it go. Do whatever you're doing a hundred percent, and do what you're interested in. It doesn't mean that you shouldn't give any thought for

tomorrow, but I'm just saying, concentrate on today. Then, whatever you end up doing will be what you were supposed to do, instead of trying to plan everything out. Also, practice listening to that still small voice inside. It's sometimes difficult to differentiate from the ego, but with practice you'll get better.

I think one of the reasons I'm basically living the life I should be living—even though I wouldn't have planned it this way, it's worked out perfectly—is because I was versatile. I did this and that. Eventually I found my career, even though it took me a long time. I didn't actually become an emergency physician until I finished my residency in '93. I was forty-three years old before I ended up in that, although I started working in emergency before that, in around '86 or '87.

I never would have planned it. All these ideas and dreams about what I was going to do—working in engineering in Africa and developing industries—at least that's what I thought my life was going to be. But I think because I was open to different things, I ended up in what I was supposed to do, which is the ER. I love doing what I do. I would do it even if I didn't get paid. Not many people, I think, are that lucky. I look around at other people, even other physicians I work with, and they hate it. They hate what they do. They spend most of the time in the doctor's lounge looking at the ticker tape, following their investments. Trying to get enough to retire is what they're doing. They hate what they're doing. Because somebody told them a long time ago that they ought to be a doctor, they went ahead and did that, but now they don't like it. They're working a job they can't stand and half of them are living with a woman they can't stand. Their lives are miserable, even though they're basically financially secure.

But coming from very poor beginnings, I'm lucky. I realized long ago that my sense of well-being had nothing to do with how much money I had in my pocket. Sometimes I've had money, and a lot of times I haven't had money. Really, my happiness was not related to that. But most people, whether rich or poor, have always been that way. The poor think money will solve their problems and rich folks are so afraid of losing their financial security.

Also, I would say, try to discover your sense of the divine. There is a need in humans, not necessarily to worship but to search for the divine. Different

people find it in different ways. Find the higher power, something that will sustain you in times of difficulty and hardship. The nature of life is to change. You have to find a way, something to hold onto, through all the changes that are going to happen in your life. Start that early. I don't think there is any one answer for everybody, but I think whatever that answer is for you, you have to establish a personal relationship and make it a part of your life.

But I would also say, don't force it. If you don't have a drive to find it, then let it go and don't let other people talk you into stuff. It will come. Whatever you have a drive to do, do that. As a matter of fact, I find that most people tend to get a spiritual drive in their thirties. I think a lot of times when they do it in their teens, they're just putting on a show, trying to pretend like they're something that they're not. But when you feel the urge to search, then do that search. Don't let the parents you love or your teachers or people you respect lead you in terms of this religious search. Everyone has to find it for themselves. Whatever you find will be real. I am convinced that there is only one God, but no matter how you find him, it will be the same God as long as you are sincere.

So that would be my only advice—let it go, search, and do the best job you can each day.

I'm reminded of a comment that "Jinx," Yolanda Hinton, said about you. You remember her? She said you were the smartest person she ever knew, because you were playing chess and driving the car at the same time going down to Cape Cod.

Of course I remember "Jinx," but I was not the chess player. That was Larry Dean and Tony Gellineau. I wanted to play chess, but the problem was I never had an urge to study it. They studied it, and they were good at it. I played chess badly.

Larry was one of the guys who definitely was there all along. We shadowed each other. He was involved in the BSU; as a matter of fact, he was the co-chair after me. He was also involved down at "The Ghetto." We used to party together. I was at his wedding in '95. We lost touch for a number of years. In the late '70s and early '80s, I lost touch with a lot of people. I was doing a lot of introspection, looking inward. But then I started coming back out in the middle '80s, and finding people. Larry was one of the first people I looked up. He is one of the people I would consider a life-long friend.

He's still a very straightforward guy and he tells you the way he sees it. I've always liked him for that. He worked at MIT for a while, as you may know.

Yes. I've always respected him. In some ways, we were different but we were the same. I was a little wilder during those days. I experimented with marijuana and all that, and he would never touch the stuff. He would never put any alcohol to his lips or anything like that—straitlaced. But yet he was wild when it came to physical things. He was our enforcer.

Do you have any suggestions you would make to the administration about how to improve or enhance the experience of blacks at MIT?

Things have changed quite a bit, and I know that students these days are not that interested in activism. I saw one son going through Indiana University, and my other son went to Old Dominion. It's like, "Oh man, they don't seem to be interested in anything. They're not interested in studying, they're not interested in partying, they're not interested in politics." But I think if you can give them a good background at least, and get them interested in trying to help each other in whatever they're trying to do, that would be good. In most cases, I think they tend to be more career-oriented than we were.

But even as far as the networking that they would be interested in, I think the important thing is to give the students a forum for an outlet and also a way that they can communicate with each other, even after they leave. I think BAMIT is really good for that, even though I have not been that active. I am a life member, but I just haven't been that active in BAMIT. There needs to be a forum for interaction between former students and current students.

When I went back to the twenty-fifth reunion at MIT, the focus was World War II. It really made me proud. Initially, I saw these old men out there doing "the bump" and everything, and I was saying, "Who are these guys?" Then later I found out they were Tuskegee Airmen, and that most of them had gone through Course XVI. It was just great talking to them, and it gave me a sense of pride seeing the things they had gone through and what had happened in their lives. Just the forum of being able to communicate with them made me feel good. I think that for certain students who will be coming along in the not-to-distant future, I'll be one of those old men out there. Those young kids are

going to wonder who I was. Then it would be great just for us to be able to talk and share experiences and to communicate across generations. It gives you a sense of perspective.

I think that right now I'm in a retrospective mode. I started doing my family tree, getting our family history together. We were sort of split apart by a lot of things. I'm looking not just at my immediate family, but finding out about the old generations in the past, the things they've gone through, so that I can give my children a sense of their heritage and what we've gone through.

It's so ironic, like I mentioned before, that a lot of my stuff was involved in the black movement and now I'm not that much a proponent of race. I'm more into helping people who need help, and people who are what I call the have-nots in society.

Regardless of who they are?

Right. I see race now as an artificial designation. Even when I look at my family tree, one side of it—the Daileys—actually started from a German. His name was Tetley and he changed it to Dailey. He was German and he got together with this Indian woman slave. I have German and Indian and black in me. For me to deny any part of that is actually denying the truth. It may not be something to be proud of, but it's the truth. It's kind of like what Tiger Woods is saying, even though people got down on him for saying it. He's saying, "I'm not going to dishonor my mother and ignore that part of my heritage." His mother is Filipino or Thai. He says, "To ask me what I am, I can't say that I'm either of those, but yet I'm all of those."

I think it's important for people to have a sense of history, of where they came from and the people who came before them. As far as MIT goes, I hope they can facilitate that by supporting groups like BAMIT and also promoting some interaction between groups. Because I was in an activist era at MIT, we were definitely involved in our education and in our community. I think it's important for people, even though this is probably more of a quiet time for everybody, still to be involved in their own education. Then you'll get more out of it.

MICHAEL S. FELD

b. 1940, SB 1963 (humanities & sciences), SM 1963 and PhD 1967 (physics) MIT; joined the MIT faculty in physics, 1967; professor of physics, 1979- ; appointed director, MIT Spectroscopy Laboratory, 1976; also director, Laser Research Facility and Laser Biomedical Research Center; member, board of directors, American Society for Laser Surgery and Medicine; fellow, American Association for the Advancement of Science; recipient, MIT Minority Community Distinguished Service Award, 1980.

I was born in Brooklyn in 1940. I lived in an apartment house. My father died of a heart attack when I was three and a half years old. It was hard for my mother, and eventually she remarried. We lived there until I was ten and then we moved to Lynbrook, Long Island. I began in the sixth grade there. After high school, I came to MIT.

Were you the only child?

No, I had a half-brother who died recently—three years ago. His name was Peter. He was born after my mother remarried. He was six years younger than I. So Peter and I were the two children.

What was the makeup of the high school that you attended—the racial makeup? Also, academically, how did you do?

Well, in terms of the racial makeup, there was only one black family in Lynbrook. Lynbrook is not a very upper-class community, but not a lower-class community either. It's sort of in the middle. There were some fancy communities in that part of Long Island, but not this one. There were a lot of Jewish people and a lot of Catholic people in the community. There was one black family and that was it. So in the high school, there was only this one—the sister was a cheerleader, and the brother was younger. Aside from the lack of blacks, however, there was a very wide mixture of kids in high school.

How did I do? I was a good student in high school.

How large was your class?

Two hundred.

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with Michael S. Feld in Cambridge, Massachusetts, 23 April 1996.

What would you say in terms of where you placed in that class?

I was pretty much at the top of the class. I was very good at math. In fact, I was so good that during class I was taught on the side by the teacher. The teacher would teach the whole class and teach me separately. When I came to MIT, I was amazed to see how ordinary I was in math compared to some of my classmates who really knew so much more than I did, who were so much stronger in math than I. It was really amazing to see. I was a good student, but by Lynbrook High School standards!

So basically, in high school you really were an outstanding student. How did you actually decide what school you would go to, what college? How did that come about? What influenced you to come to MIT?

Well, MIT seemed very exciting. I had had two high school teachers who had come from there.

One was a science teacher, but both of them were very broad in the humanities. That impressed me very much—the fact that they had very wide interests. In fact, one of them was an English teacher. They both encouraged me very strongly, and it seemed like a good opportunity. I actually won a scholarship. I won a full-tuition scholarship to MIT—nine hundred dollars! I don't know what the tuition is today, maybe \$29,000.

Exactly. It wouldn't even cover a couple of weeks. During that time, then, it sounds like you had a couple of people whom you would consider very influential in terms of your education. Who would you talk about in terms of role models and mentors up to that point?

First of all, after my father died, my uncle George, who was married to my mother's sister, was very close to me. He was always a very important role model. He was like a father to me—and to my brother—until he passed away, a couple of years ago.

Also, since you're interested in matters relating to minorities, I remember that when I was a kid—maybe two or three years old—we had what we called in those days a maid, who slept in the house—live-in help. She was black. Her name was Pearl. I was very close to her, too. I can remember her playing marbles on the street corner with my friends and me when we were maybe four or five years old. She was a very formative influence on me.

Also, in terms of minorities, I would say that being Jewish always gave me a sense of understanding the underdog, and that was always something that I was very sensitive to. I have always identified with the underdog, I suppose. Even Negro spirituals identify very closely with the slaves of the pharaoh—"Let my people go." So I always felt there was this connection between the two. But there weren't many black people in my neighborhood, and no Hispanics either. I barely knew what a Hispanic was, to tell you the truth.

So essentially, these two people in high school—the teachers—were very influential in terms of your selecting MIT to go to undergraduate school, is that right?

Yes, right.

When you came to MIT, what's your impression now of that experience? Can you recall how things were the first year or two here?

Very hard and very difficult, a lot of pressure. I think that nowadays it's easier for students, but there is still a tremendous amount of pressure.

When I was a student, we had to take not four courses each semester but five. And we had Saturday morning classes as well—laboratories, chemistry laboratories, physics laboratories. There was more work and the semesters were longer, so there was a tremendous amount of pressure always. It was the same for me as a graduate student, also.

If you reflect on the undergraduate years for the moment, can you remember any of the interracial contacts—earlier memories of contact with blacks, or even on your own views and attitudes on civil rights issues during that undergraduate period? Could you talk a little bit about that?

I joined a fraternity my freshman year, Pi Lambda Phi, to which one of my high school teachers belonged. It just so happened that that year that I joined, the fraternity also took in a black person, Mike Evans. I believe he was the first black person ever to join a fraternity at MIT. He was a very sophisticated person who came from prep school and was extremely well prepared. The next year we took another black person into our fraternity, and his background was more working-class. So there were those two people there that we had in our fraternity. I didn't really think that much about it, except that we were of course happy to have that mixture of people.

I should have graduated in 1962, but actually I graduated in 1963 because I went away for a year to study at London University. That was a year of marches to Washington. But I guess it was later on, after Martin Luther King's death, that I actually participated in my first march on Washington—the one led by Ralph Abernathy. However, aside from this, I wasn't particularly active in groups encouraging opportunities for minorities. However, I held a deep belief that such things were right.

During your undergraduate period, including the graduate period when you were here, you're talking about a span of perhaps ten years that you were actually a student at MIT?

Yes, something like that.

You came directly from undergraduate school into the graduate program here, is that right?

Yes.

Well, you're looking at about ten years. Do you recall any time, as far as making an assessment—for example,

of the black pledges—from the level of employment or in the student body in general?

No. In my students days at MIT, there were very few women and practically no blacks. Mike Evans was probably one of two or three black students in the whole class, I would guess. My main concern was keeping up with my studies.

Just trying to hang in there. You mentioned that your high school teachers had some influence on your attending MIT, but how did you actually decide to go into physics?

When I took physics as a freshman, it seemed like a very elegant subject, and I was very interested in it. I guess I had always been interested in physics, but the more I learned about it the more it seemed interesting and appealing to me. I was also interested in philosophy. When I was at London University, I studied both physics and philosophy, and I actually thought seriously of switching to philosophy. In fact, when I came back to MIT, I did a joint thesis. I got my bachelor's degree in the history and philosophy of science, writing about the history of the laser and why the laser wasn't invented in 1930, when all of the facts were fully known and all of the experimental techniques were available.

So I had a joint thesis, bachelor's and master's. One-half, the bachelor's part, was about the history and philosophy of the development of the laser, and the other half described laser spectroscopy experiments. I then went on to become a Ph.D. graduate student.

What personalities were influential during that time in terms of faculty members, administrators, or whoever? What people were influential in your continuing in that particular phase of physics and your academic life?

First, before I left for England, I was encouraged by Vicky Weisskopf. He was and is a wonderful man, kind and interested in people. I talked to him several times. He took me to lunch at the faculty club and put me in touch with other people to get further career advice. He was really great.

Then, when I returned to MIT, I had to look for a topic that combined both physics and philosophy. Professors Townes and Javan had both just come to MIT, and they were starting a group. A friend of mine suggested I join that group. So Professor Ali Javan became my thesis advisor. He was also an important influence. His research was extremely impressive, and it was a pleasure to work

in his laboratory. Townes, of course, was doing interesting things also. Those two were really very impressive role models. Townes was also the provost at the time.

I see. That made him a very powerful person in a sense, too.

I remember his power. He was also a very nice man—very straightforward, but also very respectful of the rules. I remember that because he was the provost, he didn't have a lot of time to work in the lab. But sometimes on late afternoons or on weekends, he would come to the lab. I remember one Saturday when I was working in the lab with him. We were doing an experiment and needed something from Lab Supplies. I convinced him to use his master key to open up the Lab Supplies door, which was locked. We went in and we took what we needed and left. We left a note, of course. He had a set of four keys that opened every door at MIT. To me, that was real power!

If you look at your undergraduate and graduate education here at MIT, outline what you have liked best or least about MIT's efforts while you were going through. What things did you really like best about your experience at MIT?

Well, it really was like taking a drink from a fire-hose. There was just so much information and so much knowledge there. There were individuals who were experts in every aspect of science and engineering. That was a very big plus. Also, it was a tremendous amount of work for me. Keeping up with all of the work was always difficult. I managed to do it, but it took a lot. I had some other interests at the time as well.

Long hours, right?

Yes, very long hours—many nights working through the night, writing papers, doing homework problems. You still see the students doing that today, of course. But I think it was even more rigorous then, and I think it's actually very good that the Institute has reduced the pressure on the students. Still, the students are under a lot of pressure.

We need to talk a little bit about your moving from a student category to a faculty type. How did that happen? After I got my Ph.D. degree, I was a postdoc for a couple of months. Then the department appointed me as an assistant professor. It was a short transition. I was looking for a job. So I started working here as an assistant professor.

Again, you had to be very good—just as in high school. You had finally made the transition, but you had to be very good to move from a graduate student, finish your Ph.D., and join the faculty at MIT.

I was very happy to do that and it seemed natural. I knew exactly what I wanted to work on. I had worked on several projects that Professor Javan was pursuing, but I also worked on my own things. At the time I was appointed, the physics department was being run by Al Hill, who as you know was a very outspoken man.

Al called me into his office and, in his brusque way, gave me two pieces of advice—first, get to know everybody in the department and, second, do as little teaching as possible. Al said that is what I should do if I wanted to get ahead at MIT. I always remember that. But I ignored him. For some reason, I just didn't pay any attention to his advice. I just did whatever I was interested in doing. I was interested in teaching. I didn't have that much time to get to know other people. I spent my time pursuing my own work and got to know the people who were involved in my work.

Anyway, that was his advice to a young person trying to make his way at MIT.

What were the highlights? You've been teaching and doing research at MIT now for approximately how many years?

From 1967 until now, twenty-seven years.

Well, it's certainly close to thirty years. When you look at your career so far, what things stand out as being real highlights for you personally?

First of all, some of my research projects were exciting. I discovered an effect called superradiance in the early '70s. That was a topic physicists talked about and thought about, but nobody really understood it very well at the time. That and other research projects were very exciting.

In addition, working with students has always been enjoyable. As you know, one of my graduate students was Ron McNair. Certainly, my friendship with him has been memorable, especially because he died at such an early age. That was very sad.

Talk a little bit about that because I think, outside of your actual academic field, for those of us who were around and watched the relationship between you and Ron as student and mentor, it was quite unusual. Could you talk a little bit about how that happened and the

things that you and he were involved in? It's very important, I think, for the record.

First of all, Ron came to MIT through a special program. The MIT physics department had a program in which students from historically black colleges would come to MIT in their junior year for a summer—and then, if it worked out, for a year. Al Hill had a role in organizing that program. Ron came to that program and started working with me. I don't exactly know how I got hooked up with him, but I was certainly interested in doing something like that. That was 1967 or '68, I think. Then in 1972 or '73, he returned to MIT as a graduate student.

That's about the time, somewhere between 1972 to '74. So you know more about this than I do.

Well, I was here. I came in 1972 and it was just during that time.

Ron did research with me during the summer of his sophomore year. He then went back to North Carolina A&T, where he was enrolled for a year. That was the year of the Kent State tragedy, maybe 1968. It was a very difficult year. There was some sort of riot at North Carolina A&T, and Ron never even properly finished his exams there. In fact, he told me that he was shot at in that riot and almost killed. He then returned to MIT for a year and then went back to A&T for a final year, when he graduated. Anyway, it was a very turbulent time in the United States.

Ron decided that he wanted to come to MIT to major in physics. He applied and he was accepted and we continued to work together. He had been outstanding as a student at A&T, not only in his scholastic performance, but also he was well known on campus. He played football. He also joined the karate club there and became an expert. Evidently, karate was a very serious sport at A&T.

Ron was actually born and brought up in South Carolina. It was interesting that he went to college in North Carolina. He told me that the reason that he went to North Carolina A&T was because he applied to the University of South Carolina, but they were still segregated at the time and did not accept blacks. The state of South Carolina had an arrangement in which it would send students like Ron to North Carolina and pay all of their fees, rather than accept them in South Carolina colleges. That was amazing to me. Of course, South Carolina, like much of the U.S., has

changed quite a bit and has become more progressive. But it was amazing that, even in the mid-'60s, a major university in the United States would behave in such a way. It was beyond my ability to understand.

At any rate, Ron was an expert in karate. After he came to MIT as a graduate student, he decided to start a karate club at his church in Central Square, St. Paul's AME Church. My sons—David and Jonathan—were eight years old, and Ron asked them if they would like to join the club. I took them down to the first practice. I became interested too, so we all joined. Actually, for a while, one of your sons was a member. Was it Alton?

Yes, it was.

Alton joined the club. We had a lot of youngsters in the club. You were in the club for a short while, too.

For a short while.

Actually, Ron processed many, many students through that club. There was a mixture of young kids and teenagers and a lot of adults as well, all mixed together. It was a very nice activity for me and my sons because we could all participate together on an equal basis. That was a very nice thing.

So I was Ron's thesis advisor and professor, and he was my karate master. That was a nice experience, and it never produced the slightest difficulty. Ron knew how to handle responsibility and authority very well. It was a very comfortable experience.

It was comfortable for the two of you, but there are lots of people who never would have been able to do that. That says something about you, especially. It also says something about Ron, of course, but as a faculty member with a Ph.D. student working under you, there were not any examples that I have seen like that. I don't think you have seen any either.

I never really thought about it that much. It didn't seem like a very difficult thing. It was a wonderful thing, but it didn't seem in any way really difficult. I've always tried to minimize the barriers between myself and my students.

Yes, but there was an issue during that time—even more so now—and that was the issue of race. There were many people who never saw you and Ron as just simply student versus teacher. When they first saw you, they saw color. That, again, was very unusual.

That also brings up another thing too that, I think, it would help to talk a little bit about. During your time here of thirty-some years teaching, you are one of the few people who have been very much involved with the effort to increase the black presence on this campus in several ways. I guess my question is, what have you liked best and least about MIT's efforts to increase the black presence on this campus?

One of the things I have liked the best is the tremendous support from all of the presidents of MIT that have been around since I became involved. Jerry Wiesner was extremely strong in that area; Paul Gray was very solid; Chuck Vest is also excellent. I think that at the highest level there has been an unparalleled sense of commitment. That speaks very well for the kind of people MIT selects as its presidents. Without that kind of commitment and deep belief in recognizing the importance of this, MIT would really not be able to take the positions that it has taken and do some of the things that it has attempted to do. MIT hasn't always succeeded in all of the things it has attempted to do, but it has made some excellent efforts. That's one of the things that I have appreciated most.

The things that I have appreciated the least would be just the complexity of our system. Power flows from the top down in a broadly distributed way. The president doesn't have total power, as might be the case in a large company. The centers of power are broadly separated, and many people with a variety of opinions and degrees of motivation on this subject are in leadership positions. Some of them haven't shown the level of commitment or interest that the presidents of MIT have shown. That has sometimes caused difficulties, even in making logical small steps.

If you had to assess the recruitment and affirmative action efforts and policies during the last two decades, including both those established by MIT and those mandated by law, how would you come down on an assessment? Should we confine ourselves to blacks?

In this case it would be helpful.

First of all, there are black undergraduates, black graduate students, black professors, black employees, and they're all different cases.

I agree, and because you played a pivotal role in being the chairman of the Equal Opportunity Committee for at least five or six years, you are in a good position to make

an assessment in each one of those categories. In fact, you did a study, when you were chairman, of the entire broad sweep of the institution. So how do you assess it?

The first thing is that at every level—if we talk about, say, the students or the faculty—the pools are small, and you have to work very, very hard to select people for each of the categories that can do well at MIT and be comfortable at MIT and be accepted as equal citizens at MIT. It would be a serious mistake if we had a different standard for accepting black people at any of those levels—undergraduates or graduate students or faculty—than we did anybody else, because that would lead to bad repercussions down the road. MIT has generally been conscious of that.

So the pools are small. I've always felt that the most powerful pivot point is the faculty, because those people have a lot of power and prestige and authority at MIT and their actions have the biggest multiplying effect. So having a strong black faculty is very important in moving MIT ahead. But it really requires specially focused efforts to increase the number of faculty members, to recruit talented black faculty. The pools in every field of science and engineering are typically one percent of those in, say, the white majority. So it's hard and, although I think we have a reasonable record, we certainly don't have as outstanding a record as we could if we really put enough muscle behind it in our efforts. When you talk to people about this, they say, "Well, the problem really isn't with the faculty. We can't do much about that, so we should really work at the graduate student level and at the undergraduate level and the grade school level, and so forth and so on." Of course, all those things are true, but if you keep on displacing the problem to another part of the system, then you never get anywhere. So I personally felt that it was important to attack the problem at all of the different levels simultaneously.

Okay, I talked about faculty. In terms of graduate students, that really requires, again, very serious recruitment. I've seen that both undergraduates and graduates who have come to MIT suffer problems which are not always scholastic, but much more complicated—societal problems and problems having to do with getting along at a place like MIT, which is not always a very nurturing place. Graduate students definitely need mentors. Not only graduate students, but also in my opinion every faculty member, black or white, should have

a mentor. It's important to make sure that each person who comes—every black, since we're talking about blacks—has somebody who really is aware and cares about that person. That is very, very important.

I hear you saying something that relates to all MIT students. Do I hear you saying that MIT is not a very nurturing place for anybody?

Not always, and not for everyone. MIT can be a difficult place for students to flourish in, because there's so much pressure and so much demand on the pursuit of excellence, and so much competition. You have good students of various levels that are all mixed together. Take my own case. As I explained earlier, I was a very good high school student, but in the milieu of MIT I was much less outstanding than I was in high school. So no matter how good you are, when you're at MIT there are always people who are much better scholastically than you are, and people much better than them! This leads to a situation where people are always competing and trying to excel and working very hard, very intensely, probably more intensely than at most campuses in the United States or in the world.

When people ask me about sending their kids to MIT, I tell them that MIT is not for everyone. You have to really be quite independent. You have to have the ability to figure out how to apportion your time. You have to show maturity in being able to handle yourself. White or black, if you don't have those characteristics, you will not do well. I think it's harder still for black students, who have other non-academic issues, than it is for majority students.

Do you think that there is a degree of intensity beyond the normal for blacks in this regard?

I don't really know. I do know that some of the black students that come here have very high ideals. For example, one of the most intellectually difficult areas of physics is theoretical particle physics. Many black students who come here want to become theoretical particle physicists just because they have heard that it's the most difficult and challenging area. They set themselves up for going right to the top. Some of them very quickly find that it's hard to go right to the top. They may wind up in the middle, or the bottom even, especially because there are other issues—non-academic issues—which many of them come into contact

with, issues having to do with discrimination, and more generally, issues having to do with a lack of sense of belonging maybe, a sense of community. For example, somebody who came from a historically black college might feel much more comfortable in that milieu than in the milieu of MIT which, as the saying goes, is like taking a drink from a firehose, without letup.

Consider the role played by senior mentors and role models in career development for newcomers of all races. Compare, if you would, and contrast attitudes towards blacks and other groups in what you've been able to see in your department, in your role as chairman of the Equal Opportunity Committee, and people of all races you've talked to. What's your view on that?

There's a broad spectrum, I think. I think there are some people who are very committed to this issue. They feel that MIT has a special responsibility to insure that we have a broad, multiracial community with the best people from each sector coming in, and that that makes MIT a stronger place. On the other hand, there are some people who are pretty much indifferent and feel that MIT shouldn't bother with such things, that its objective is excellence in the pursuit of knowledge, that we shouldn't bother to deal with difficult social issues of this type, that we should just do our thing and if some reasonable minority student happens to come along, that is fine, but there should be no special efforts at all to try to improve the situation. And there are, perhaps, even a few with worse attitudes.

But even if you take that attitude and even those that are worse, if you look at MIT—if you look across the faculty, for example—what percentage do you think fall in that category?

It's really hard to say. I guess I would say that there's a small nucleus of people who deeply believe in affirmative action and equal opportunity and enriching the community in this way. Maybe fifteen percent of the people feel very strongly about it, maybe ten percent.

Let me stop you there. How many people do you think you have run across in your thirty-some years here who fall in your own category?

Let's just say my category, people who deeply care about these things.

But how do you determine if somebody cares about something?

Well, by their accomplishments in this area, I suppose.

Right, exactly. You are a scientist, so you know how you get results, right? I could name at least five or six very significant things you have done that deal with the issue of race. I'm asking you, approximately how many people do you know, or can you name, in your faculty category? I can name people who I think really are serious about this—Bob Birgeneau, John Wynne. I think Constantine Simonides very strongly believed these things. I'm mentioning white males.

That's who I would like for you to mention.

Jerry Friedman is certainly very interested in such issues; Phil Morrison—people like that. There's Steve Crandall, who recruited Jim Williams. So I mean these people who are in the nucleus feel very strongly about it.

I think that, when you just try to name them as you've done there, you probably have left out several people. But I would say that you named fewer than ten people there. I would say that if you try hard you would do well if you could get twenty to thirty people on the faculty whom you know, out of a faculty of nearly a thousand.

Yes, you might be right. I don't know all the people who feel strongly about this, but if we really made an exhaustive list and got to know all these people, we could probably get the list up to between fifty and a hundred, I would say. But you would know better than I do, perhaps.

Well, all I can say is that I have observed the results. I mean, actions say more than anything else. When I look at you and I look at those people you named, their actions speak for themselves. I think coming up with fifty people in the Institute like that, you would probably be doing the best you can do, if I had to say people who are on the faculty who have done the same kinds of things as these people you are talking about. Why is it, from your viewpoint, that these people are who they are—and I'm talking to several of them because I'm trying to get a sense about it—and where do they come from? What makes them up?

Let me just say that in my own department there's also Ed Farhi, who believes deeply in these things. George Koster is a very caring person in this area. There are probably a few others. In each department there are some, though I think that in some ways physicists are particularly interested in this.

Why is that?

I don't know, exactly. Physicists are actually pretty practical-minded people, and trained in being fair and logical. Maybe it's for that reason; I don't really know. Ernie Moniz is another person who cares about these things. Each person is different. I don't know if there's a common thread. Ernie has a Portuguese-American background, so maybe he also identifies with the underdog. I don't know about the background of other people like, say, Jerry Friedman or Phil Morrison. I have no idea why they are so strong in this area.

I have some sense about it. I have found, for example, in this institution that there are more Jewish faculty members who stand up in this kind of arena than any other group of people.

That's interesting, yes. When I was naming the names, it didn't strike me. I wasn't thinking about Jewish people, but it's interesting, because it is true, I think, that despite the tensions which exist between some black groups and some Jewish groups, as a group Jews appreciate suffering particularly and are sensitive to trying to remedy it. First of all, they don't like to see others suffer; no group does. But also, in our heritage, there is a strong requirement to try to do righteous things in areas such as this, based on where we came from—not only in World War II, the concentration camps, but going back to the days of slavery. Jews are brought up to remember that they were once slaves. I don't know what the sociology of that was, and how such an experience could be so long-lasting, but I guess it persisted generation after generation and century after century as Jews were kept in ghettos and excluded from certain countries and certain professions. So it's sort of a collective memory which has become embedded in Jewish people.

That may be one reason why many, but certainly not all, of the people who are active in this area, are Jewish. People like Constantine or John Wynne certainly are wonderful examples of non-Jews who really care about these things, or Ernie Moniz or Bob Birgeneau, who I think is Catholic. Some Catholics also have very strong feelings from a religious point of view about this. Of course, there are other Catholics who think that the Jews killed Christ, and there are certain Jews who have crazy beliefs also. So you can't just sort of use religion itself as the only basis for this.

I agree, but let me just say this. When I look at the twenty-something years I've been here, there are three fac-

ulty members who stand out very much in my mind. There are others, I'm sure, if I thought about it. But there are three whom I consider as individuals who really have shown a commitment to not just talk but to be there when the chips are down—Steve Crandall, yourself, and Leon Trilling from Aero and Astro. Leon was the chairman of the Equal Opportunity Committee long before you became chairman, I think. He was one of the first. He should also, I think, be given credit for whatever has happened in his department relative to black faculty members. Wes Harris clearly was mentored by him, also those who came after him who were black. I mean, he has been a trouper just like yourself during his time as chairman of the committee.

But when I look at those three models, no matter where the chips were, they were there. When I look at the characteristics of these individuals, there is an element about the Jewish background, I do believe.

Crandall is Jewish?

No, I don't think he is.

Maybe he has a Jewish heart. Trilling, I have no idea.

He comes out of the same kind of background as yours, or very similar.

You mean he had a father who had died at an early age?

Well, it was something very similar to that—and growing up in a majority Jewish community and not rich or anything, but really working hard, very supportive, and being discriminated against at times. I don't know; all I'm saying is, there's something there.

Let me also say that it's interesting that I myself have experienced only a tiny amount of discrimination. However, my uncles and other relatives—the generation before me—always talked about how much discrimination they experienced. But the discrimination I've experienced has really been minor, so I have been blessed with not having a lot of that kind of experience.

I want you to quickly review the role that you have played over the years to increase the black presence at MIT.

I especially remember two black Ph.D. graduate students—Ron McNair and Bill Quivers, who is now the chairman of the physics department at Wellesley. Lots of black students have worked in our lab. Right now Marta Dark, a black woman, is working in our lab and will soon get her Ph.D.

I have also been active in minority activities in the MIT physics department, and chaired the Institute's Equal Opportunity Committee for a number of years. Not all of our projects there were focused on blacks. We were also interested in seeing how women were doing at MIT, and understanding the so-called "glass ceiling" in the administration. We were, of course, interested in minorities, the presence of black and Hispanic graduate students and faculty members as well. We also looked at the situation at Lincoln Labs. There were lots of projects that our committee worked on at that time.

One became a classic, though. Talk about that study that you did in a little bit more detail, because that still is used today.

Not being a labor economist, I probably didn't do a very scientific thing, but we invented a way of analyzing the Institute's complete employment profile. I forget what we called it. What we did was to consider the different administrative staff of the Institute, of which there were a couple thousand people, if I remember correctly.

That's right.

We considered white males, white females, and blacks and Hispanics, but there were very few Hispanics at the time. It was around 1975, I think. For each of these categories, we divided the group into three different layers—lower, middle, and upper—in terms of job stratification. In each case, we studied the flow of people into the system from both the sub-administrative ranks—the secretarial pool, for example—and also the flow of people from the outside coming in at every level, studying in time how they progressed, as well as their flow out the top and out the sides, so to speak. So we could compare the relative advancement of people in these three different groups.

In addition, we could study some widely held beliefs by senior-level people at the Institute. For example, "There's no turnover at the top" was something that has been said to me many times—"That's the reason why we don't have many women or minorities in the top ranks." Another statement was, "We grow our own, and since none of our own are minorities, we don't have any minorities at the top." We were able to see whether there was turnover at the top or not. With John Wynne's support—he was then our vice president for personnel—we obtained the

raw data. That took a long time, since at that time MIT didn't have very good historical records about the people in the system. It took us many, many months to get all of the information and to put it into a formalism that could be worked with. But eventually we could study the turnover at the top and we could study the extent to which we grow our own.

It turned out that neither of those two sayings was true. In fact, there was a large amount of turnover at the top. If you looked over any reasonable period of time, the number of changes in the senior administration was quite large. And still, the number of women or blacks selected for those positions was very few. Similarly, it turned out that we don't really grow our own that much, at least in the study that we did. A very large number of people came from outside, and very few were promoted from the bottom and middle ranks into the highest rank.

That was the kind of study we did. I don't remember all the details, because it was twenty years ago. I and a lot of other people on our committee worked very hard on it, but in the end this study really was never presented to the administration in a very serious way. The reason why was interesting. Our study had in it one very "dangerous" piece of information, which had nothing to do with minorities or women. It was that over the ten-year period that we studied, the size of the administrative staff had gone up by a factor of between two and three. It had expanded way out of proportion to every other part of the Institute. This looked very bad for the administration—at least some people viewed it as looking bad, although there might have been justifiable reasons for why it occurred. I don't really know, to be honest with you, but I think that people felt that our study should be suppressed just because of this very damning piece of information which emerged from it. As it is, in our current efforts in reengineering, we are finally facing up to some issues that people who studied these statistics knew about in 1975.

What advice would you offer to blacks, from your experience, who might come here in the future as faculty members? Being a faculty member yourself for a long time, what advice would you offer a young black scholar coming into MIT?

I guess maybe Al Hill was right, in part—get to know everybody in your department, but do a lot

of teaching! But seriously speaking, my advice would be to find a mentor. That would be the most important thing. Having help getting through the system is incredibly important, and having someone who can give you guidance and act as your advocate and also give you advice about what you're doing wrong—very frank advice—is very important in a system such as ours. In some sense, it's not a naturally nurturing system at any level, and I would say that having a mentor is very important. So my advice would be try to find a mentor if one doesn't naturally emerge, or is not provided.

Are there any suggestions you would make to improve or enhance the experience of blacks who are here at the present time? I mean, to the departments where black faculty are moving up in the system?

I would say, again, be sure that minority individuals—undergraduates, graduate students, or faculty—don't fall through the cracks by inattention, or worse. Each department should give very special care to each of these people, because these people are really very talented and very rare and a very special group. I think that we've seen a number of examples where that hasn't happened, unfortunately, where people have just—through inattention—slipped through the cracks. That has made the situation much worse in a number of ways.

I've known you a long time and I have never seen you uncomfortable or unnatural around black folks. Do you have any sense about how people could be more like that? Do you understand my question?

I guess so, and I guess I really haven't the vaguest idea how to answer it, to be honest.

Well, that's you. I mean, I'm not surprised. Most Jewish people are like that. I mean, you take it for granted, but in general the majority of people are not like that.

I wouldn't even be aware of that, and I know that you would be. It's just too bad. I don't know how you teach a person or work with a person to get him to behave in a natural or comfortable way with people who are a little different.

See, I keep trying to wrestle with that because I'm still trying to find ways to explain it. I mean, how do people get that way? That's what I'm saying. I really don't understand it totally. I think I have some clues, but I keep trying to get individuals like you to share your opinions about how one becomes the way you are. It's just you. It's not anything that you're putting it on, it's just you.

I think there must be a sense of security in believing that the people you are relating to are not going to harm you in any way and that they're really not going to be different from you in any way, or that if they are different from you, they may be different from you in ways which are interesting and maybe even valuable. It's really hard to know. I wish I had some magical understanding of the situation, but I just don't.

JAMES H. WILLIAMS, JR.

SB 1967 and SM 1968 (mechanical engineering) MIT, PhD 1970 (mechanical engineering) Cambridge University; from apprentice machinist to senior design engineer, Newport News Shipyard, 1960-1970; joined the MIT faculty in 1970; professor of mechanical engineering, 1981- ; School of Engineering Professor of Teaching Excellence, 1991- ; Charles F. Hopewell Faculty Fellow, 1993- ; member, Task Force on Educational Opportunity, 1971-1972; recipient of numerous awards, including Everett Moore Baker Award for Outstanding Undergraduate Teaching, 1973; J. P. Den Hartog Distinguished Educator Award, 1981; Edison Man of the Year Award, 1993.

I was born on April 4th, 1941, in Newport News, Virginia. I'm one of two children. I have a sister who is three and a half years younger than I. My father worked in the Newport News Shipyard as a skilled laborer; my mother was a housewife. At the same time my parents operated a small restaurant called "Greasy's Place" that sold standard types of food that today would be called "soul food," but then it was just food. Students from the local black high school used to come and eat lunch there as well.

I remember the war—that is, World War II—in the sense that I remember the blackouts. Many of the men in the neighborhood would have helmets, flashlights, and nightsticks as part of the civil defense program. I remember, for example, some nights all of the lights would go out, for whatever reason. That had nothing to do with electrical power, but it had to do with the war effort, because within that region there were several military facilities: Fort Monroe, Fort Eustis, the naval base in Norfolk, the private shipyard in Newport News, Langley Air Force Base, for example—all were in that area. So that was one of the potential areas that might have been attacked by the Axis.

When I was about eight years old, my parents divorced, that is, my father left us—my mother, my sister and me—and moved to Detroit. My mother continued for a while to run the restaurant, and that was basically the source of our income. In 1952, my mother remarried. By the way, my mother's maiden name was Margaret Louise Holt, so when I was born she was Margaret Louise Williams. When she remarried in 1952, she mar-

ried James N. Mitchell, thus becoming Margaret Louise Mitchell. My sister's name is Sarah Ernestine Williams.

So my mother remarried in 1952 and my stepfather and my mother then proceeded to build a house in that same community. It was a brand new house in which everyone took great pride. My stepfather, like my father, was also a skilled laborer in the Newport News Shipyard. From my very early years, I was extraordinarily well cared for. There was an abundance of love in the household, there were plenty of physical things in the sense of food and clothing and access to movies and all that sort of thing. This was exclusively an all-black environment, as all environments were in the South in those days. There was very little mixing between the races, except the occasional interaction with whites in the work environment. That

Edited and excerpted from oral history interviews conducted by Clarence G. Williams with James H. Williams, Jr., in Cambridge, Massachusetts, 25 April and 6 August 1996.

means that I didn't interact with whites at all, except in the downtown—which we called overtown—department stores.

Thus, my interactions with whites were of the following character. My mother at a very early age encouraged me and taught me to take public transportation. Even before I could read, she allowed me to take public transportation to another part of town that was predominantly white in order to do shopping. I would go to the bakery or go to the Woolworth's or go wherever I wanted to go within that all-white environment, primarily to go shopping. So, I knew how to use public transportation even before I could read. I was three or four years old when she allowed me to go. What she taught me was that there were certain bus stops where only the bus that would go back to my house would stop. Even though I couldn't read the name or the title of the bus in terms of its destination, I knew that that was the only bus that stopped on that particular corner. She allowed me to explore and indeed encouraged that sense of exploration.

I remember that when I was in the second grade—I was seven years old—I had saved up my allowance for about three years. Normally, my elementary school would dismiss us around 2:30 in the afternoon. I remember it was March 1949. I specifically remember this. I remember it not because of the year, but because I know I was in the second grade. I didn't get home one day until about six o'clock. My mother was very angry at me, probably because she was worried about my welfare. She sat me down and in a stern voice asked me, "Where have you been, where have you been, where have you been?" And I refused to tell her. Finally, because the threats became so heavy, I had to break down and tell her that I had been in the white section—"overtown." I had been overtown shopping for her birthday and the money I had saved the previous three years enabled me to buy her a set of china—dishes that became the primary set of family china for the rest of her life. So those were the dishes that we used whenever we had special guests or Thanksgiving dinner. It was a beautiful set of dishes. Even today in 1996, it's simply a beautiful set of dishes. So I broke down and told her I had done that for her birthday, and I could see her face sagging as a result of her intense inquiry.

Throughout my elementary school, as I said, I had possessions of comfort and I more or less did whatever I wanted to do. I did very, very well in school—not only later in high school, but it all started in elementary school. The primary motivation I had was my mother, in the sense that it really didn't matter to me whether I made good grades. Who in the hell cared? I mean, young kids didn't care. The one thing that I noticed was that when I brought my report card home with all A's and gave it to my mother, I would simply hand it to her and watch her smile. I would get good grades only for that purpose, just to get that expression and that smile. That was my only motivation for getting A's. Otherwise, I didn't give a damn about school or anything, except having a good time. That was my only motivation for doing well. When it came time to do things in music, while other kids were renting instruments my mother would buy me an instrument. So in the sixth grade, a flute and a piccolo were purchased for me. In that sense, I truly had a very rich environment. I had all the physical things that I wanted, and a lot of love from my mother. Furthermore, even though my father had moved away to Detroit, he maintained contact and I would spend weeks during the summer in Detroit with him.

Tell me a little bit about the high school.

I attended Huntington High School, again an all-black high school, in Newport News, Virginia. Huntington as a high school—within the black community in the state of Virginia—had a good reputation. Mostly when we talked about good reputation, it was based on how good the football team was. That was the number one thing. The school had basketball, baseball, and track and field, and Huntington was very good in those as well, but it had an excellent football team and that made the school good. But, in comparison with the other black high schools, it was also a solid environment academically.

In high school, again, I was somewhat of a hell-raiser or hellion—I guess the nice word is iconoclast—in terms of doing things, getting into trouble, enjoying myself, but always making very good grades because I knew that I could get a smile from my mom when I took those grades home. Again, I was very fortunate and lucky, I had things. For example, my parents—at that time it was my stepfather, James Mitchell, and my mother—

actually bought me a car before I was old enough to have a driver's license. At that point, the only time I was allowed to drive the car, that is, prior to getting my license, was to Sunday school. That meant that I regularly attended Sunday school and church during that period. They would let me take the car on Sunday morning and drive to Sunday school and then drive back. I could do that from the time that I was twelve years old until I got my learner's permit at fifteen and then the driver's license at sixteen. So I've owned a car since I was about twelve years old.

You had a real smart mother. She's brilliant.

She really gave me space and she was very supportive. In retrospect, I learned years later by talking with her how sometimes when she would let me go off and do these things she would worry, but she thought she should let me do them nevertheless. She repeatedly taught me—both by her words and deeds—that if you are tough enough to be willing to try something you want to accomplish, then try it. She once said to me that if you get knocked down in attempting something you want to accomplish, you haven't failed until you refuse or are unable to get back up. Winners are not people who never get knocked down; winners are people who are willing to get up; and first-place winners get up the fastest.

One of the things I didn't mention was that when I was very young—even five or six years old—I used to help in the restaurant, Greasy's Place. I used to run the cash register while my mother would work in the kitchen. I used to stand on a beer crate in order to be able to reach the cash register. So in that sense, my mother and I were extraordinarily close, by virtue of the fact that my father had left when I was young. In some sense we were really a combination—mother and son first of all, but we were also like sister and brother, I mean, we were really close. In fact, one of the things I remember that my mother told me about is that even when I was three and four months old—when my father wasn't around, either at work or out on the street—she had nobody with whom to talk. She would sit me up in a chair and simply talk to me as if I were an adult. She would explain to me whatever it was that she had to say and look at me and talk to me. She said obviously I couldn't talk, but I would simply sit there and just look at her. It was as if I did

understand. I'm almost sure I didn't, but I'm fairly certain in retrospect that that helped my development, because she said that she wouldn't ever use baby talk with me. She'd just talk to me as if I were an adult friend, and I would just sit there and look at her. That was the way we interacted. That tightened our relationship, obviously. That made her very important to me and obviously made me important to her.

Child-rearing experts now say that that's what you should do.

Obviously she didn't know that, but that's what she did for whatever reason. She was comfortable with my eccentricities and she rarely attempted to moderate them, never without explanation. So anyway, in high school, as I said, I did well academically. I played in the band for a while, but then I also played on several of the athletic teams. There were various types of math and science conferences that were held for the all-black schools in the state of Virginia, and they would be held at one of the predominantly black colleges, typically in the spring. For example, some years they would be held at Virginia Union in Richmond, some years at Virginia State in Petersburg, sometimes at Hampton Institute, as it was called at the time, in Hampton, Virginia. High school students from all over the state would go and take exams in algebra or biology or trigonometry or physics or chemistry. Typically, I would go to these—basically once every year, and depending on what I was competing in, I placed first in the state in those various exams. These are certificates that I still have today in scrapbooks. At the time, I would simply bring those home and give them to my mother so I could get the smile. I lost track of those certificates and plaques. But when I became an adult, I discovered that they had all been maintained in a certain place. As time went on in my adulthood, I compiled them, and I now have all of those things at home in a scrapbook—and a lot of the news articles that were written about me during that period which my mother had saved. Now I have them, but I certainly didn't save them during that period.

Finally, I had some thoughtful and caring high school teachers. For example, two of my high school science teachers—Mr. Holmes and Mr. Johnson—would give me quizzes that had two to three times the number of questions that were on the quizzes of the other students. This was done by

mutual agreement since it was understood that I would earn an A in the class. The goal was to challenge me and to try to keep me occupied throughout the quiz period.

Clearly your family members, and especially your mother, were very influential. Did you have any other kind of role models or influential people in your high school or elsewhere?

The irony is that I did not have role models in an intellectual sense when I was growing up. I mean, the people that I admired when I was growing up were, in essence, athletes or performers. When I was in high school, we'd form our singing groups. There was a singing group on nearly every corner; we'd stand around and hum and whatever. The group I formed was probably about average. It wasn't as good as the better ones and it was better than the worst ones.

So in that sense, those were the people that one admired. For example, at the time, I could name the complete starting rosters of almost all the major league baseball teams. I could tell you all the batting averages of certainly all the black players and most of the white players too. Basically, that was really the focus. Within the black community, if you wanted to talk with other people and sit around and have a conversation, you had to talk mostly sports. You could talk a little bit about the entertainment people, but certainly with the men it was mostly sports at that point. Furthermore, it was mostly baseball or maybe a little boxing as well. But you had to talk sports if you wanted to talk with males, particularly older men, which was one of the things I always enjoyed. From the time I was a little kid, I always enjoyed sitting around listening to older men. I didn't realize that fifty-five wasn't that old, but at the time they were in their forties, and they used to talk about the good old days and how it was when they were coming up. I was a seven- or eight-year-old kid. I would love to sit around and talk and listen to those guys talk about the good old days. But the point is—in some sense, in a role model sense—those were really my role models.

I had a few teachers, again all black, who took a special interest in me. Within the black community, there were social/occupational strata. Basically, within the black community if your father or mother was a lawyer, doctor, minister, or school teacher—and somehow mail carriers got

into that upper echelon too—then you were of a certain kind. My parents were obviously skilled workers in the shipyard, so I was not in the upper echelon. I did have a few teachers who saw me as talented in some way or another and who took a certain amount of interest in me. Because I excelled academically that made me acceptable, but still I felt that I was not in that upper echelon. That probably was part of the reason I used to raise hell so much, even in high school.

Tell us a little bit about raising hell.

For one thing, a friend of mine would come into some of my classes sometimes and tell my teacher, whoever the teacher was, that I was wanted in the principal's office. Then once he got me out—note that he had previously told his teacher that he had to go to the bathroom—then I would go to his classroom, to whatever class he was in, and tell his teacher—his name was Ernest—Ernest was wanted in the principal's office. So as far as the teachers knew, we were both going to the principal's office; so we would take off and go down the street to the pool hall and shoot some pool and then get back for the next class, and then maybe pull another scam.

Another thing is that I was always sensitive in some sense to the underdog. If there was somebody who was being picked on—again, this was an all-black environment—I would frequently come to that person's defense, and so I would get in trouble. They'd say I was starting fights or trouble. The irony is that if I got sent home, my mother would always bring me back that day and I'd be back in school within an hour; again, we were as much buddies as mother and son. So when I graduated from high school, at my commencement, the principal announced that I was the only student in my graduating class who had never been tardy and had never been absent in five years of high school. So, although I was the only student in my graduating class who had never been tardy nor absent, I would raise hell. It was that kind of hell. It wasn't stealing or drinking or anything like that. It was mostly hanging out with the boys, being one of the boys.

How did you actually get interested in an area, in a field that virtually very few blacks were in?

That's a very interesting point, which I can very distinctly remember. I had indicated to you earlier how I used to go into the white community which was called overtown. One of the things I

would do after I got into high school, for example, when I went overtown was that I would go to a newsstand there and I would stand around and read *Time* magazine or *Newsweek* or some other national magazine. I never saw *Time* magazine in the black community. I saw *Jet*, but not *Time*. So, I remember it was October, 1957, when Sputnik was launched. I was in my junior year, and I was overtown and began to read *Time* magazine. There was a statement written by somebody—I don't know who, but I remember the statement in *Time* magazine where they wrote that the response to the Russians will be focused and defined and developed at places like the Massachusetts Institute of Technology. It went on to describe how all these smart guys would sit around and engage in technical discussions, and how after lunch all the paper placemats had been flipped over and there were equations on them, and that this was where America's response would be defined. I said, "Goddamn, I think I want to go there."

I then sent away for admissions information to MIT, but the problem was that tuition at MIT was almost, I think, \$700 a semester. I said, "Wow!" I can't tell my mother that because if I let my mother know that I wanted to go to MIT, I know some way or another she's going to find the money and I don't want to put that load on her. I knew if I expressed an interest in it, she was going to find a way to get me to MIT. The idea of a scholarship, work-study, or anything in terms of financial aid never occurred to me. I couldn't see that. All I could see was this huge amount of money which probably ended up being maybe \$2500 to \$3000 per year in tuition and living expenses, and \$2500 at that time was big money. I just couldn't see expressing that interest, so I kept it to myself. I didn't share that with anybody because I knew if it got back to my mother she would try to send me. So that's when I became interested in the notion of potentially pursuing science or engineering as a career.

Now, just let me finish that line very quickly, in the sense that even though I was a great high school student, I didn't see much of a reason to go to college, particularly the colleges being attended by my classmates. I didn't want to put the load on my family, and so at that point I simply fell through the cracks. It's a long story, but what I did was to travel up and down the East Coast, hanging out and gambling. Baltimore, Merchantville—

upstate in New Jersey, East Orange, up there you know, hanging out. I'd sit in the pool room with my Gulf service station uniform or baker's outfit—both of which were shams—and the grease under my nails or flour on my shoes. (You can see how amused I am today by lame excuses of students for lack of performance.)

"Hey, boy, you want some of this action?"

"No, sir. No thanks." I had already decided to just do what I want. "No thanks, sir."

"Come on, boy, you just got paid. It's Friday, I know you got paid today."

"No, sir, no thanks."

"What's wrong with you? Come over here."

"Well, I'll try one."

And so sometimes I had to run out of those pool rooms. I had to leave fast. I remember one time I was in New York City, you know, up in Harlem playing cards and things late at night with guys. One night this guy sat down at the card table and set his gun right on the table too. I lost the money I had won to that point that night and I just left. No, I wasn't playing that game anymore. I was only eighteen years old.

This is after high school?

After high school, after I graduated from high school. I have to tell you, my mother had begun to get worried, so I went back to Newport News, Virginia. The Shipyard there had an apprentice school. It was run by the Shipyard and it had been run for, well, actually almost from the very beginning of the Shipyard, which was started in the 1880s. It had grown by this time to have its own faculty and director and it had about six hundred students. It would accept students into a program such as machinists or electricians or riveters, for example. In the Apprentice School, students would be paid forty hours a week and they would work typically all day on Monday, Wednesday, and Friday, but then on Tuesday and Thursday mornings they would go to formal classes and take courses. They would take courses in algebra, mechanical drawing, and shipbuilding terminology; and maybe a bit on writing, how to construct a paragraph and that sort of thing. It's a very long story, but they had just begun to admit blacks into the Apprentice School. So finally—after much effort—I was able to get into this apprentice training program as an apprentice machinist. I remember my first paycheck was \$66 per week. I made

\$1.65 an hour. If you multiply 40 by \$1.65, you will probably come up with \$66. I remember that first check.

At the time, it was my first real interaction with whites on a daily basis. I had interacted with whites on a casual or a business basis when I used to go overtown, but it was the first time I had any other kind of interaction with whites, certainly the first time I had stepped into a classroom with whites. I remember working on a machine one day and I was standing around in the machine shop with about four or five other apprentices. I had been into the program about three or four months at that point and I was taking the whole thing relatively casually. It was fine; I was working and making money and we were joking and finally I said, "Well, I'm going back to my machine." I remember as I was leaving and approaching my machine, presumably out of earshot, I heard one of the white guys say, "Why is that nigger always over here joking with us?" When I heard that, it angered me. I said okay, all right, and for the very first time in my life, through all of my schooling, I started studying. Before that I had a reputation, and indeed it was true. In high school, I had a reputation that I never took a book home. Nobody ever saw me take a book home because I never took one home. I'd do my homework assignments as my high school teacher was doing whatever the teacher was doing, because everything was so slow that I could listen and do my homework at the same time. That's the way I did homework throughout high school. So when I was at school, I was at school. But when I left at the end of the day, I was through with school every day—I never took a book home.

But my point is that for the very first time, I started studying in the Apprentice School. Then I began setting records for the academic portion of the Apprentice School. Again, I have news articles about all of what I'm saying. We were on a numerical system; it wasn't A, B, C. It was a numerical system based on 100. Academic scores would be averaged on that basis. They used to post the rankings of all the students every quarter. We were on a quarter system. All of a sudden, I was ranked first. Everybody else was white and this was the 1960s South. I'm first, so they stop posting grades. I then began to really study, studying for the first time in my life. I would take books home, I would work at night. I would make sure that in the machine

shop I would do things accurately. Every year at commencement, they had a medal that they would give to the top first-year student, and then the top second-year student, the top third-year student. I took that first-year top medal, and no one in the history of the Apprentice School had ever won more than one medal throughout his program. The first year I took the top medal in the school, and the second year I took the top medal in the school, and the third year I took the top medal in the school. They used to transfer the top students into the drafting rooms to teach them to become mechanical designers. They hadn't had any blacks in that area because that was in the office where you wore a dress shirt and tie to work. No black had ever worked in the shipyard as an engineer or designer up to that point.

It was undeniable at that point, so they then gave me the opportunity to leave the shops and move into the drafting or drawing room. Actually, I can tell you that the tension had built up so much at that moment, and there was so much discussion within the minority community about whether or not they would put me into the drawing room, that I distinctly remember the day they told me I would be transferred. I still consider that one of the great moments in my life in terms of achievement, including my graduation from MIT. It's ironic how things get ranked in terms of one's mind, in terms of the significance and priority.

In that kind of segregated southern community, that is a major achievement.

Yes, within that community, and that community was hometown. So they transferred me into the drafting rooms. And another thing that was happening at the same time, which they had typically done in various cases, was that they would identify top apprentices and give them the support to go to college. Each year they would send maybe one or two of the top apprentices off to college, and they would go either to Virginia Tech—almost all of them went to Virginia Tech—or a few of them went to North Carolina State in Raleigh. So ultimately it was clear that I was coming up for such a decision. When my time came, they did not appear to pause. I give them credit, I really do give them credit because they could have somewhat balked, but they didn't. I mean, even though it was obvious within the community, they could have said, "Well, we don't give a damn, we're not going

to do it.” But when the time came, and I really have to give them credit, I never felt that they cheated me out of anything in that environment. Even though it was quite racist, I really feel that they saw, recognized, and responded to the quality of my performance. They came to me and they said, “We’re going to send you off to school.” They said, “Typically we send our students to North Carolina State or Virginia Tech,” and they realized themselves that both of those institutions were somewhat racist. So, in their own subtle way they said, “Well, we typically send them to VPI or NC State, but where would you like to go?” I immediately said, “I want to go to MIT.” So they said, “If you want to go to MIT and if you can get in, we’ll send you.”

So that’s the way that went. In fact, they paid for everything. They paid for my tuition, room and board, plus travel when I came to MIT. That was the bottom line.

So talk a little bit about coming to MIT—leaving Newport News, Virginia, coming to Cambridge, Massachusetts as an African-American student.

At the time it was kind of a big deal, and certainly within the black community in Newport News people would be talking about that. But there was an interesting additional story in the sense that the Shipyard did not tell me that they would send me off to college until around April of ’63. Obviously all of the admissions decisions within MIT had been completed at that point. It was suggested to me by an MIT alumnus, and I don’t remember who it was, that maybe I should apply and just come up here and talk to the admissions people. This was in early May. I remember flying to Boston, taking a taxi from Logan and coming in, and at that time I talked with the director of admissions, Roland B. Greeley. He was the director of admissions. We sat in his office and talked, and he said, “I’m not sure I should let you in. It’s late and I’m not sure that you could even do well here. But if you want to come, I’ll let you in.” It was that kind of discussion and negotiation which I found extraordinarily interesting and which worked.

Now, two points about that. One is that I remember that as a faculty member I used to be one of the commencement marshals from time to time. I remember the first year that I was a faculty marshal at commencement that one of the people

who retired was Roland B. Greeley. That is the guy I had sat with in that office who sort of equivocated—perhaps or even probably playfully—in terms of my being admitted as an undergraduate. So as a faculty member I had retired him that day as a faculty member. Another point, and this is slightly out of chronological order. This is an interesting point as well. I must admit that in numerous instances, whites who have been in responsible or power positions have looked at my performance and given me an opportunity without trying to retard me. So, although this is slightly out of context, I was going to say that when I was about to graduate with my bachelor’s degree, I had applied to several graduate schools throughout the country and had been accepted to all of them and was generally offered funding of some sort, either a fellowship or research assistantship. I was considering various schools around the country, but still a little uneasy about a choice among them. I had visited a number of schools including, for example, West Virginia. I often tell people now, hell, if I had known that I was giving up my opportunity to be president of MIT, I might have gone to West Virginia. (That’s a little joke, referring to the home state and university of our president, Charles Vest.)

But that’s beside the point. This is the point that I wanted to make about MIT. In May, when I was about to graduate with my bachelor’s degree, I was walking down the corridor one day and saw Professor Ernest Rabinowicz, who was one of my professors in mechanical engineering. He stopped me in the corridor and said, “Hey, how are you doing and what are you going to be doing?” I said, “Well, I’m not sure, I’m still trying to decide.” I still hadn’t decided which graduate school I wanted to attend. He said, “Look, you don’t want to go to another school, you’re at the best. Why don’t you come here?” I said, “Well, I haven’t applied.” He said, “Well look, you come back and see me tomorrow.” I went back to see him the following day and he said to me, “I tell you what you do, you go see Professor Crandall.” So I went in to see Professor Crandall, whom I had never met. I had used his textbooks as an undergraduate and seen his name, but I had no idea what he looked like and had never met him. I went in and talked with Professor Crandall. Professor Crandall said, “Okay, you come back tomorrow.” So I went back the next day and he said, “We’re going to give you a research assistantship but you should go see

Professor McClintock,” who confirmed my support to start graduate school at MIT, starting that summer.

And here comes the beauty of this story. I started graduate school with a research assistantship with Professor Frank A. McClintock in the area of fracture of materials. One day, I think it was probably by then August during that summer, I was walking down the hall and I saw Professor Warren Rohsenow, who was the graduate admissions officer at that time. He waved to me and said, “Hey Jim, how are you doing?” I said, “Fine.” He said, “Look, I know you’re working with Frank on your master’s thesis, but would you drop by my office one day and fill out an application for graduate school?” I said, “Okay, yeah, I’ll come by there one day.” So a week or two later I went to his office and filled out an application to come to graduate school. It was beautiful, and I have to give those professors, who became my colleagues, credit. These are individuals whom I really respect.

Anyway, I know that story is slightly out of order, but it talks about being admitted into MIT. That’s the way I came into the master’s program and got my master’s degree here. It’s very interesting. Just as an aside, I think one of the things that has served me very, very well—and it started with my mother—is that when people do things for you, you say thank you; when you address people, you say sir; when you request something, you say please; and when it’s given to you, you say thank you. Manners will carry you a hell of a long way. It’s very important to have a degree of etiquette or manners when you’re dealing with people, and I think that some of our young people aren’t sensitive to that issue now.

When you look at your overall experience as a student, both undergraduate and graduate, what are some of the highlights?

Well, that’s very tricky. When I was a student, at least within the circles and the environment that I traveled, MIT was simply an environment to endure, to get your degree and to get the hell out of here. That’s what one wanted to do. You wanted to get out of here, but you wanted to leave through the front door and not the back door, you understand? That meant you had to work hard. The environment was much more academically intense than it is now. Students were much more focused on engineering and science, much less

interested in other kinds of things. As I was telling a student recently, when I was an undergraduate there were few women and very, very few minorities around. I think all of the women lived in McCormick, the undergraduate females. I think there were probably only 125 women total in the undergraduate student body at the time. Certainly when I arrived, no black women had ever attended. When I was here, the first black women came in. There were two of them. Shirley Jackson and Jennifer Rudd came together as the first black undergraduate females. There were about a dozen black Americans in the entire undergraduate student body.

All the walls were gray, every wall in the place was gray. Every Friday morning all of the freshmen would gather and take the same exam—all one thousand freshmen. They would distribute us between DuPont Gymnasium and Walker Memorial and maybe 26-100 or wherever, and throughout the semester it rotated through the subjects so you knew every Friday morning where you had to be. You would take a physics exam, chemistry, calculus—physics, chemistry, calculus—and you did that throughout the term. You knew they were going to create a bell curve and they were going to lop a lot of you off the bottom, and that was the deal. That’s the way it was. The environment was academically intense in that sense. Very little in the way of extracurricular activities. There were some kids who were into extracurricular activities, but extremely few minorities.

I had an experience in my freshman year that had soured me on white students at MIT. When I was a freshman, I was naive regarding rush week and the issue of living assignments. I specifically remember that MIT housed us temporarily in East Campus. This was before the lottery and the selection to your living group had occurred. The other guys who were in East Campus and I would get together—obviously all white at this point, all the other guys were white. We would say, “Well, look, they’re serving food at a particular fraternity during rush, let’s go over and get some food.” So we would go around to different living groups and get food, just to eat. I remember specifically that Beta Theta Pi was having one of these rush events where they were having food. I went over there to get some food and after I was there for a while one of the Beta Theta Pi guys, white guys, pulled me aside and said to me, “Jim, I’m sorry, I’d like to

have you, but the guys in the house just can't have any 'Negroes' at this time. They just don't want any colored guys and they've outvoted me." I had not realized I was there for that purpose, but I was being rejected by Beta Theta Pi.

That opened my eyes because when I was coming from the South to MIT in the North, I figured I was going to a non-racist Nirvana. There wasn't any prejudice at MIT up North. So in some sense, it's amazing to me how naive I was regarding differences and non-differences between the southern backwoods and the enlightened northern MIT. Integration existed in the North, so everything was fine; you could go into any restaurant and eat. So I was rejected at Beta Theta Pi not knowing that I had even applied; very quaint and very enlightening. That told me that I'd better pull back a bit and focus on my work. By and large, I must say that as an undergraduate what I used to do was simply to get my work done on campus.

All of the black students knew each other. I mean, every one of us. There were maybe a dozen total in the entire undergraduate student body. Everybody knew everybody's name. Even in the spring of a given year, we would know the names of the ones that were coming in the next freshman class. We'd say, "We heard that this guy is coming." We knew the names of the students that were coming who were black. That's how few of us there were.

As a student, I would go off into the city when I wanted some entertainment, which I would do sometimes on the weekend. I would go down to Roxbury and, at the time, there were several very nice clubs in Roxbury. I was old enough to drink and I would sit at the bar and listen to the music, talk to some of the brothers and sisters, never ever revealing my MIT status or connections. These places have now deteriorated. One of them was the Rainbow Lounge on Tremont Street, another was Big Jim's on the corner of Mass Ave and Washington Street. That's where they would have good jazz. That's where I would hang out. I didn't win any student awards because I really wasn't involved in MIT as a student beyond simply some academics. In that sense, there was isolation, not community.

Was it hard? The academics, was it very difficult?

I would say at the beginning it was difficult for me in the sense that—and I suspect many students

found it difficult in the same sense—this stuff is tougher than anything I've faced, but my major concern is that I can't fail because how can I ever face the people at home if I fail? And it was that tension, I think, that had more to do with the difficulty than the work—or as much, at least. If you did poorly on a quiz, you might be on that lower part of that bell curve; and thus, you might have to be lopped off. Almost everybody blew a quiz occasionally. I remember my very first chemistry quiz. I did well in a lot of subjects, obviously, but for some reason one of the things I remember is that I scored a 38 on my very first chemistry quiz and that scared the pure hell out of me. So when you say difficult; yes, you're worried, but I got a 38; I ain't *never* seen no score like that with my name at the top of the page. I mean, I'm making 90-something to 100 on quizzes all my life—and I got a 38, so that scared the hell out of me.

So it was difficult in that tension sense. Once I got through my freshman year and got into mechanical engineering, the fact that I had worked in the shipyard and that I could visualize real machinery, having seen it, I could see what some of the equations were trying to represent. In that sense, I actually feel that I really had an advantage over students who were simply learning the theory. In fact, I had probably seen some practical things that many professors hadn't seen. So in that sense I think that had a lot to do with why I did well in engineering.

Some time back I remember you said something about pretending to go to your room to sleep, when you were in fact going to study.

That's true too. When I was a student, I lived in East Campus for a while, maybe a year and a half. Part of the strategy was to appear not to be working. There was a group of guys that used to hang out and we used to call ourselves the lounge lizards. We used to hang out in the first floor lounge in East Campus. I was the only black among the lounge lizards, and we would all sit around, talk, play bridge and laugh. Basically, what would happen is that after dinner, which we would generally have at Walker, the lizards would come back and we would either play bridge or simply hang out. After about an hour of that stuff, I would yawn and say, "Man, I'm tired; I've been partying too heavy. I'm going upstairs and get me some sleep, man." So I would go up to my room,

pull the shades down, and get me a light over in the corner and study my ass off. I studied hard and long. It turned out, though, that a lot of the lounge lizards failed. They were put out for academic reasons. Although many of them ultimately graduated, few of them made it in four years. The guys were amazed. “Jim, you’re a lounge lizard too, how did you make it?” “I don’t know, man, I must be good.”

You don’t read it as often as you used to, but when Henry Louis (“Skip”) Gates first came to Boston from Duke, he used to say in these articles or whatever how he was the first black who’d ever been to Cambridge and all this kind of stuff. He didn’t know any better, but I kind of helped those guys understand that wasn’t so after a while.

While I was a student working on my master’s, a visiting faculty member came over from England. He was a faculty member at Liverpool and taught the graduate elasticity course at MIT that summer. I was looking for a course to take, since I was just starting out in graduate school, and there were maybe forty students in this class. Among this class of about forty graduate students, I was consistently scoring the highest grade on all the quizzes, so this guy sought me out. He began to talk to me and ask me, what are you going to do, what’s your future and such questions. As I said, I had sort of backed into my choice of graduate school at MIT because I really wasn’t sure what I wanted to do. When I looked at other graduate programs in the U.S., I saw them as simply being imitators of MIT—or just so much like MIT that I really didn’t see any true value in going to a Stanford or an Illinois or a Berkeley. I really saw them as more of the same. This guy was very impressed with what I was doing in this elasticity course. On each quiz I had the highest grade. So he began to talk to me about world-class engineering and world-class universities, and he convinced me to consider going to England. He said I could go to Liverpool and work with him. But, he paused and offered his most honest opinion: that the number one place was Cambridge.

And that’s how Cambridge first came to me as a potential option. I began to explore it at that point. At the same time, I completed my master’s very quickly. I finished my master’s program by the end of the first semester. Then I left MIT and went back to the Shipyard and worked before I went to England; that is, in the spring semester of what

would have been my first year of graduate school. But in the meantime I was exploring this Cambridge option. Then I began to read that Isaac Newton was there and Maxwell and Rutherford and Rayleigh and Bertrand Russell—I mean, names that you just pass over or glance over in textbooks because often these individuals are so legendary that you don’t even relate these names to real people. These are almost icons. As a student, one does not think of Isaac Newton as somebody who went to school. It’s so interesting how naive we can be as youngsters. So I began to read and I decided Cambridge might be the place for me. So I applied for fellowships and applied to Cambridge. I was fully supported by fellowships here in the United States, ultimately through the Danforth Foundation. I wasn’t in England for very long, because I did a doctorate fairly quickly.

In September and October of my second year at Cambridge, I started getting letters from professors at MIT. The letters started to say things like if you decide to consider an academic career, I hope you will consider us. This was after I had been at Cambridge only for about twelve months. I still have some of those letters; letters from Professors Frank McClintock and Stephen Crandall. When I started getting those letters, I realized that a career at MIT was a possibility. I’d never ever dreamed as an undergraduate, I could not imagine myself being a professor at MIT. It was beyond my imagination. Indeed, when I was an undergraduate, I held professors in such high regard that it wasn’t obvious to me that professors had to go to the bathroom. I’m serious. So that was the first time I even dreamed of being a faculty member at MIT.

When I was at the Shipyard, there was a particular problem that I had encountered. When I explored that problem, I discovered that no one knew how to solve it. So when I went off to Cambridge I said, this is the problem I want to solve. My advisor there was a distinguished faculty member whose name is Professor Edward Parkes, head of engineering mechanics there at Cambridge at the time. He took me on, which was significant now that I understand it because faculty really do take you on—you don’t really select the faculty, they select you. But in any event, he looked at the problem and said, yes; you want to do that problem, if you can solve that problem, you deserve a doctorate. So what happened was

that, as it turned out, I solved the problem in a few months. He said, you can't get a doctorate so fast. I said okay, fine, no problem.

He and I then looked for some more problems to solve, including experiments. He was a consultant for the oil industry and they had a problem that they couldn't solve, with oil storage tanks. Basically, what would happen is that these tanks would settle differentially, meaning that one side would settle relative to the other side. These were 100-foot diameter oil storage tanks. If they settled on one side more than on the other, they would go out of round and sometimes they would even crack or burst. We wanted to understand how to make sure that those tanks remained round. So he said, okay, well, maybe you should do another problem. I said, okay, I'll solve another one. So I solved that second problem in a few months.

That was getting towards the end of the first year. My supervisor then said, you've solved both of these problems, so I'm going to go to the university senate to explore the issue of your being allowed to finish early. At Cambridge a minimum of three years of residency was required, but there was a rule that said under very special circumstances, one can obtain a doctorate in two years. That rule is written into my degree from Cambridge. I spent the second year more or less writing up the results in great detail and traveling to France, back and forth to Paris, to the Mediterranean, Nice, Cannes, Monte Carlo, and doing that sort of thing while writing.

Basically, before two years following my master's degree were up, I was back at MIT on the faculty. In the intervening time, I had informed the mechanical engineering department here that I was going to be finishing early. They said, whenever you get ready, come on. So I was back here in less than two years. That's why when you look at my resume, I got my bachelor's in '67, master's in '68, and my doctorate in '70.

That's record time!

Yes, and even though I got my master's degree in '68—it is true that it was delivered at the commencement in '68—in fact, I wasn't here and didn't march because I was back in Newport News. I had left MIT after the first semester, and I was working at the Shipyard.

Did you run into any kind of racial problems during that period at Cambridge?

It's interesting because, relatively speaking, I would absolutely have to say within the university—zero. Within the town, for example, if you went out into the town, there were townies or ruffians. They didn't like university students whether they were white or black. It wasn't so much a racial issue as the fact that these townies just thought that the university guys were sticks in the mud or stuffy. But within the context of the university, I just have to say that I was treated beautifully. For example, when my supervisor went on an extended trip, he would give his car to me so that I could go sight-seeing around England.

By the way, I attended Trinity College. When I was a graduate student, Prince Charles was an undergraduate in Trinity College also. He would appear in the dining hall just as everybody else would. Part of the environment at Cambridge—which is a very old university, the oldest college in Cambridge dates from 1284—is that there's so much tradition and history there that I became interested in the humanities. That was one of several very valuable benefits of my Cambridge education. It broadened me and that's why I look at history now in anything technical or non-technical I explore. I was truly broadened in that very special way.

But the point I was going to make is that there were long wooden dining tables and there was always a class or hierarchical structure. The senior faculty sat at the top at what's called "high table" and they had one meal; they would have leafy green salads and a fish course. Then you'd have junior faculty members just below them in the front and their menu. Then the graduate students sat and they had a different meal. All of the graduate students ate the same thing, but their meal was not as luxurious as the faculty. Then the undergraduates sat towards the back and they also had a different meal, not as attractive as that eaten by the graduate students. Prince Charles had to sit with the undergraduates. There was someone always with him. I don't think it was necessarily a bodyguard, but it was like a companion or escort. He would dine and you would see him sitting back there with the undergraduates who would eat relatively simply, perhaps spaghetti with a little meat sauce. The graduate students would have a small cut of meat or whatever. The faculty would have even a nicer meal and then the high table would have the nicest meal, with wine of course.

You could see all of this in the dining hall and you knew where you were in the hierarchy. Everybody wore a black gown to hall. Dinner was sit-down service by the staff; individuals did not get their own dinner. That was the dining ritual at Cambridge—very interesting.

That's so far away from Newport News.
Yes, worlds apart.

You talk about from Newport News to a new world at MIT, then Cambridge, England ... just to think about being across the water.

At that time it was a big deal with the Newport News black community. That was quite an experience.

Could you spend a minute talking about your undergraduate days up to this point of your Cambridge experience? What about role models and mentors who influenced your life in that period?

It was interesting because, as I said, in a very real sense, certainly coming from Virginia, I had people in the community whom I respected, but there was certainly no black role model in engineering or science at that point. There was simply no basis for that. After I became a student, and certainly a graduate student both at MIT and at Cambridge, I began to see how various individuals operated. Again, none of these individuals was black, but, in some sense, that did not matter. I began to admire and respect those traits that I interpreted as positive, and those traits that were respected by others I perhaps began to imitate or adopt. So it's kind of complicated because once I began to get nibbles from MIT my thinking became more focused on an academic career. By the way, I began to get nibbles also from Princeton, Stanford, University of Illinois at Champagne-Urbana. I began to get nibbles from all of those schools in terms of faculty positions. The only school, the one and only school that I initiated contact with was Howard University in DC. I got a letter back from them that they weren't interested.

They slammed the door.

I don't know what was going on. I think the head of the mechanical engineering department was asleep at the switch or he didn't give a damn because later on, that is, a few years after that, Dr. Lucius Walker, who was the dean at that point, did everything he could to attract me to Howard and apologized for the treatment I had received earlier.

It's just an interesting story that the only school that I contacted told me that they weren't interested, and that school was Howard University.

But in any event, once I began to get these nibbles then in a very, very special way I began to look in a detailed way at how individuals lectured and what was good about the way in which they lectured and what was not good. In some sense, I'm sure that I began to inculcate in my own thinking as a future faculty member those things that really enable students to understand a lecture. I really began to think about it more seriously at that point. There were people such as Professor Crandall at MIT, who was extraordinary in the sense that his real strong feature was that he talked very, very slowly, but everything he said had meaning; he didn't go back and repeat much of it, and it was very mathematical. It comes out very slowly, he doesn't repeat it, but it's all there. Then there was another MIT teacher named Professor Den Hartog who was very relaxed and lively and light about the way he did things, somewhat of a story teller. So when we speak of role models, I looked at these different faculty members and I took from them those qualities that I thought were interesting and suitable to my personality. Then I began to place my own personality onto their attractive attributes. In that sense, my role models probably didn't extend very far beyond the individual professors whom I had known.

Talk a little bit about what you can recall about that experience—coming back as a faculty member—particularly after being a student for so long at this institution.

I suppose one of the things that strikes me initially—and I think it was both good and bad—is that they gave me a small office as they do most assistant professors, but there wasn't very much special attention or special consideration given to me. It was good in the sense that I think I was treated just like every other new assistant professor. That was wonderful. On the other hand, there were certain things that were expected of me, being a minority faculty member and at that time the only black faculty member in the School of Engineering. Within my department, for example, I was actually in two separate divisions. Our department has three divisions. I was in both the systems and design division, and the mechanics and materials division. At that particular time, I don't think that there was a lot of communication

between the two divisions, so because they had placed me in two divisions, each division was assigning me teaching and advising responsibilities.

That's a double load.

That's exactly right. I was doing more teaching and more advising than most people within the department at the time. It seemed okay to me because I didn't know any better. Indeed, there was one semester in which I taught four subjects, with major responsibility in three of them.

That's unheard of now.

That is totally unheard of now. As I said, I don't think there was something done intentionally against me, but it simply occurred because they were trying both to utilize my design experience from the Shipyard in one division, and in the other division they were trying to utilize my theoretical and quantitative training that I had obtained, both as a graduate student at MIT and as a graduate student at Cambridge University, which was in the applied mechanics area. They recognized those capabilities that I had.

So as I said, they put me in two divisions, but then the two divisions didn't communicate, so I had very heavy teaching and advising loads. Also, when the word got around that there was this minority—in particular black—faculty member in the School of Engineering, it meant that lots of students came to see me and, primarily, to get to know me. I remember as an assistant professor, there was a young lady named Inez Hope, who is the daughter of our former assistant dean for student affairs. She used to come to see me, simply because one day both of us were in the elevator going to the Barker Engineering Library and I introduced myself and we talked. I said, "Please come by and see me some time." She was an undergraduate in mechanical engineering. She was also taking a course that I was not teaching that semester, and she was having difficulty. In my understanding of what a faculty member was to be about—I mean, you're supposed to help students—I began to tutor her in the course in which she was having difficulty, even though I wasn't teaching that course. I would assume that kind of responsibility in thermodynamics and fluid mechanics, anybody who came, not understanding that I had to get a research program going to build a reputation—a professional reputation—outside of MIT.

At the time, Shirley Jackson was doing her Ph.D. under the supervision of Professor Jim Young and there were some strains between the two of them. I think the strains were primarily a matter of just communication, but there were a few technical issues as well that Shirley had yet to address. Shirley would come to my office and I would talk with her about technical issues relating to her Ph.D. thesis and about potential personality conflicts between her and Professor Young. Unbeknownst, I think, to either of them, I would talk with both Shirley and with Professor Young in a way that I thought smoothed or ameliorated some of the circumstances that existed between the two of them.

So those were just two examples. As I said, they were occurring almost everywhere. In addition to that, there were people throughout the School of Engineering and even within the Institute who said, "Okay, now we need minority representation on this committee and that committee," and so I was asked to be on numerous committees. I thought you were supposed to say yes, because that's why I was here.

After about two or maybe three years, I was sitting down with the head of my department—a man named Ascher Shapiro—to talk about my progress as a junior faculty member here. He was very complimentary of all of the things that I was doing outside of my regular teaching. But he said to me, "Look, you're someone who I believe really has the innate talent to be successful here at MIT, but you're not getting any research done. Without succeeding along that direction as well, you simply won't be able to make it." He was a guy who was very clear in what he said. He didn't mince his words. He didn't try to sweeten it, but he was also supportive in a professional sense. He was saying that it was up to me and that I had to make a mark in research as well. At that point, then, I thought I was working full-time anyway; I was working days and nights. I had to double up even more to begin to write proposals because I don't think I had written any proposals to get research money. It was really a very interesting situation because I had nobody to tell me. I was sitting on the first floor, isolated from the rest of the faculty, who were on the third floor, and no one, no senior faculty, was telling me that I had to do these things. No one had really taken me on to say that to me. I was at least two years into my assistant professorship before

someone said that to me, and Ascher Shapiro was the person who said it.

I don't want to be too long in my answer, but I think all of these points are significant because this is the way it was from 1970 to about 1973.

So Shapiro was the guy who actually told you really what the deal was here. This brings up this whole issue about role models and mentors. Could you talk a little bit about how that has affected you in terms of your career?

As I said, no one had said anything to me about that until Shapiro mentioned it, which he did in my annual review since he was head of the department. I have said that my office was on the first floor during that period, but it was later on—basically two years later, meaning 1974—that ultimately some discussion had ensued, probably at a senior level within the department, that I should move my office to the third floor and be more specifically affiliated with the applied mechanics field. It was probably at that point that I began to feel that there was someone who was looking over my shoulder and beginning to collaborate with me, and indeed that person was Steve Crandall. It was shortly before that time that Steve had invited me to participate with him in a research proposal. He and I had begun a research effort, starting with his initiation, investigating the response of buildings in earthquakes. It was at that point that I began to understand and feel that there was some mentoring occurring, that is, on my behalf. Of course, at that point it was time to be considered for promotion to associate professor without tenure. So even though I had been here, I guess, for about four years at that point, one of the things that I did do immediately after Shapiro gave me that word in 1972, was that I wrote a proposal to the NSF—National Science Foundation—which was called a research initiation proposal for study of fiber-reinforced composites and erosion of composites, and I had gotten some research funding. I was beginning to publish papers, both from my Ph.D. thesis as well as from this NSF research initiation grant. By 1974, when I moved to the third floor and began to sense this direct mentoring from Steve Crandall, I had published some more papers. So after Shapiro buzzed me in 1972, between 1972 and 1974, I had then published about a half dozen or so papers. By 1974, I was promotable to associate professor, but without tenure at that point.

That mentoring by Steve Crandall I have felt throughout the years. While he has been the primary one, the reality is that I feel that a number of senior faculty members within my department have been very supportive and have acknowledged the contributions that I have made. While there have been several, Frank McClintock, Ernest Rabinowicz, Robert Mann, and Richard Lyon come quickly to mind.

Reflect a little bit on your overall experience at MIT. Again, identify what you would consider of special significance—in your case academic as a student, but also within the professional category.

You mean highlights in terms of accomplishments or acknowledgments by others or awards?

I think a combination of all of them in terms of what you feel has been significant in your career so far. When you think about and look back at your career so far, what things do you really feel stand out about your association with this institution? It is a combination of a number of those things you just mentioned.

Well, certainly in terms of professional acknowledgments, for example, I've won a number of teaching awards. In 1973, for example, I won the Everett Moore Baker Award, which is given to the outstanding undergraduate teacher at MIT. By the way, very early on, it was very clear by virtue of student evaluations—these were published by students that go back to '70-'71—that my classroom teaching ratings were extraordinary, meaning that I was consistently among the top five professors at the Institute, according to student evaluations. Now whether or not students were learning anything is another issue which I can address, by the way, because evaluations suggest that students do learn better in courses in which they say they learn better.

When my student evaluations were published—students used to publish them every semester—I would be listed among the top three to five in the Institute. Other faculty members in my department—in particular junior faculty members with whom I was competing in some sense for promotion and tenure, but also a few senior members—suggested that maybe the reason why students liked me so well was because I was spoon-feeding them. I was accused of being soft on students. This used to bug me, used to tick me off. After I faced that implication a couple of times, I said, "Look, what we're going to do is that

we're going to teach multiple sections of the same subject. In other words, I'm going to teach one section, you're going to teach one section, we'll have Professor X teach another section, and Professor Y teach yet another section. Then we'll let Professor Z write the final exam. Professor Z won't know who taught what specific topics. That's the way we're going to do it. Then all the students take Professor Z's final. We just give them a common final. Then based on however these students rank, we'll see how it goes." What ultimately happened was that they discovered that when the final exam grades came out, over all of the sections, my students got most of the A's on the final exam. That happened more than once. So then, that more or less pulled the net out, you know what I mean? You see, the issue is if the students are learning the material and if they're capable of taking an examination not written by me but written by somebody else, then that's the measure. That was the way that that got cleaned up. Again, part of the issue is that in some sense we're almost always on the defensive because we're viewed as somebody's affirmative action case.

But in any event, I guess the point I was making is that as early as 1973 I won the Everett Moore Baker Award and I won a number of other awards for teaching excellence, including the first Den Hartog Award in my department. Of course, now I hold the chair in the School of Engineering for Teaching Excellence, as well as I'm a MacVicar Faculty Fellow. So I feel, at least in terms of my teaching, I've been acknowledged. I've also published a large number of papers and so I've been acknowledged outside of the Institute. At a professional level, I feel that I've been acknowledged, although I am aware that there have been attempts to undermine my reputation.

Let me just make a note on this. At one point I think there were only two blacks who held a chair, maybe one. Is that correct?

I think Ken Manning does now, too.

That's right, you and Ken, which is really significant in a sense at this place, in terms of what that means. You mentioned how people can perceive a faculty person, particularly in the early stages of a black faculty presence here. The early 1970s clearly was one of the early stages. There's the whole issue about people seeing you and all of a sudden assuming that you are an affirmative action case and always having to defend yourself and even when

you do well—extremely well—it's hard to even get a note about the fact that you are doing well. Have you experienced a lot of that? I know you have, so could you talk a little bit about it.

That is very much a reality of the environment. I think once you realize that that is the situation, I think you pick yourself up and you just go on. That is the reality.

You've answered to a certain extent, but let me go back and ask the question I have here. What is best about your experience at MIT and what would you consider the worst about your experience so far?

Well, the thing that I think is best really—and my guess is that this would be common to many faculty members irrespective of race or gender—is that MIT, at least from my perspective as an engineering academic, is an environment of gifted individuals, gifted colleagues, very bright students, and a lot of flexibility and freedom if you're succeeding at what it is you do. In other words, you don't have to do what is necessarily always expected that you would be doing, but if you're doing it well, then people are pretty much willing to allow you to go on and do what you want to do. That kind of environment around people who are very sharp, who are hard-working, and the freedom to express oneself, I think is really what it is that I like most about MIT. I think that that's probably true of many of my colleagues as well, irrespective of who they are.

Let me ask a question about that, because you've traveled all over the world and in many cases in that traveling you have gone to a lot of universities worldwide. Have you found that we usually are above most of the institutions or all the institutions you've experienced?

Without question we are above most of them, as far as that's concerned. Certainly there are institutions that are comparable to MIT in some general sense in terms of the quality of the faculty and the students that they are capable of attracting, but I really don't know of any institution that is better than MIT in terms of allowing faculty to express themselves individually and to do their own thing. In that sense, I think that's an important part of our culture. I guess MIT grew in that way from the post-World War II period. That's really become an ingrained part of the culture of MIT.

When you talk about some of the worst things, that's somewhat complicated because, as I said, in general, it's an environment in which we

really don't compliment each other. As a minority faculty member, I think that in some sense one major regret I might have is that we as a minority community never came together in a way that I think might have been optimal in some sense. Certainly that's true, I would say, on the faculty side. It might be less true on the administrative side. I think we could have been more unified and therefore stronger in some ways that we failed to realize. Perhaps, again, that might have been due to our own individual egos in some sense. I think that there may have been an opportunity that we never realized as the minority faculty community. I tried to pull the black faculty together, but failed.

I have two questions about that because that's a very important point, it seems to me. One is, you made a point earlier that part of the faculty's sort of culture here is of a nature that people don't actually compliment or they're not able to relate to each other and they all have strong egos. But I also hear you saying the same thing about your black colleagues as well over this period of time. Is that not correct?

I am, that's exactly right. I'm saying that, as a minority community, I don't think that that serves us ideally. I am saying the same thing about our minority community as well. When I say our minority community, I want to be very clear about the fact that I consider myself just one member of that community, so I'm no better or worse than any other minority faculty member. I have been as supportive and, in some ways, as detrimental to that unity as anybody else. I feel that the presidents that we've had at MIT during my time—that is, Wiesner, Gray, and Vest—may not necessarily have encouraged that kind of unity, but irrespective of that, it was our responsibility to do it as a minority community. By the way, I think that MIT has been fortunate. When I take the whole interval around that set of presidents, I think we've been very fortunate to have had those three individuals as presidents during that period. I think we could have had individuals who were much less supportive and could have made things even more difficult for us as a community.

You mentioned that perhaps we didn't do as well as we could have over the 1970s and '80s, particularly. If you had a chance to do it again, what would you have done differently, and what would you have recommended to the minority community to have done differently?

That's a very important question. Just let me say prior to trying to respond to that, that part of the reason I think that we didn't do as well as we might have done is that we as minority individual faculty members also had all of the same pressures that are on majority faculty members. We still have to teach. We still have to go out and raise money to support our research activities. We have to do the student advising. So when it comes time to compare us or evaluate us for promotion within our own disciplines, we have to stand on our own individual bottoms in terms of how much money did you bring in, how many papers did you publish, etc. There are pressures on us that don't necessarily always support that issue of trying to create a sense of community.

But I suppose if I had to do it over again, what I would want to do is to be even clearer to the minority community in terms of at least approaching the central administration with a single voice that in some sense presented them with some fairly simple options. Again, the central administration has its own set of problems as well that have nothing to do with minorities. I think that very often, in the past anyway, if the central administration got a mixed message from the minority community, as it certainly got many mixed messages, then it could not be expected to respond in some ideal fashion to whatever our needs were. So it's really quite complicated. You have to be fair to people in terms of assessing where other people are. Again, as I said, I really have to compliment the three individuals who have been president since I've been here, even though I've had battles with all of them. I feel that in all of those cases, whatever battles there were, they were generally not personalized, that both they and I had the best interest of the Institute in mind.

What would you recommend to a group of young Jim Williamses at this stage of their career, knowing what you know now, how to make some impact at an institution like this?

It is so interesting because I have to say at the outset that I don't feel that I have the answers. I only have a perspective and a piece of an answer. Mostly it begins with creating a sense of community and getting to know each other and trying to understand how individuals can be mutually supportive in some way. At various times, I've said this to my

colleagues. I know that as far back as twenty years ago I suggested that we form some kind of a joint consulting effort so that we could represent to the outside world a single face. I didn't get much support for that. So in some sense, what happened was that without support for those kinds of ideas from my individual colleagues—those black colleagues, now—what I did was I just simply went out and did my own thing and made it for myself. Still, I believe that if we as a group had done it, we would have been much stronger in some way or another. We would have, in fact, perhaps created something that would have been sufficiently identifiable that young people coming in could see this existing structure—this existing entity—that they could then move into and become a part of and have both an inheritance and a legacy in some sense, and perhaps build the entity even beyond that. I'm really somewhat critical of my own generation, much more so in terms of not having initiated this core which young individuals could walk into and become a part of. So again, I think that that structure needs to be created.

I remember one conference in the early 1970s. You were one of the speakers and I remember you making a recommendation about a black think tank.

That's right, that's exactly right, going back about twenty-five years. That was one of the things that I thought we should have done. I felt even at that point that one of the ways that we at MIT as a minority community could make a mark would be to create a so-called black think tank in which not only we could provide the core in terms of individuals and residents, but we might even attract people from around the country, from around the world, to come together and to begin to formulate ideas that were much more forward-thinking, than to be worried about some of the current political issues. I wanted to create that kind of forward-looking thinking because I felt that we had a core of people who were capable of really making a statement that could have national significance. So if a group of us at MIT, say a dozen of us, could have made those kinds of statements in some joint fashion, I think that political parties, state and federal governments would have listened. Blacks elsewhere may not always agree, but they could read what the black think tank at MIT was saying about the next five years or ten years—what our goals should be, what urban renewal should be

undertaken. I think that we had the power to do that. I remember people telling me that that was nonsense or whatever and I just felt that I couldn't make people see what it was that I was trying to project at that point.

Well, it was a powerful vision when I look back on it now. I can't imagine where we would be presently if that idea had been taken to heart.

Also, there was this very important event, a personal demonstration that you initiated, which I think was probably one of the most courageous acts that I have seen since I've been here. Could you talk a little bit about why you did that, and what you did so that it could be on the record?

The demonstration in 1991? In part, I laid it out in the *Faculty Newsletter* article. One of the things that I remember from that demonstration—and this is an odd thing to stick in my mind, but it certainly does stick in my mind—is a faculty member, Robert McKersie. He's a professor in the Sloan School of Management here. I had never met him and I haven't seen him since, but when I was demonstrating out there one day, he came out and sat with me for about an hour one day. This was after the news media had quieted down. He sat down with me and he introduced himself. He said, "Look, we don't know each other. I really respect what you're doing. Let's not get into the issue of whether I agree with you or not, because that's sort of irrelevant. That's not why I'm here. I teach negotiation and how people make statements at the Sloan School. I'm amazed by what you're doing just from a professional perspective. I want to know how did you figure this out, to do what you're doing? What techniques and mental processes led you to making this particular statement in this way?" So one of the things that sticks in my mind is that this professor from the Sloan School was interested in this demonstration from an intellectual perspective. He wasn't very interested in the issues, just the intellectualism of the protest.

But the point is this. I guess I had gotten to a point where, and I can probably say this somewhat openly now, I had fought over and over again with the previous administration and I was getting tired. I felt that our community was being dissipated in many respects. I want to be very clear that when I say I had gotten tired and frustrated, the word administration means Paul Gray's administration. I

respect Paul and again, as I said earlier, whatever disagreements we have had, I always felt that they were never at a personal level. The one thing I respect him for was that whatever nonsense I may have expressed, I never sensed any revenge on his part against me. So I really respect him. But this was now around 1991. We were confronted with a new administration, an administration headed by someone who had come from the outside. I had watched the number of black faculty members dwindle to about half of what they had been in the prior decade. I felt that at least in terms of a political identity, the student body was unfocused. I looked around and I didn't see other black faculty members who were prepared to make any statement or do anything, so I said, "I'm going to do something. I have to at least put this new administration on notice that we're just tired of this nonsense. But I have to do it as an individual and that's the way it has to be."

That was the basis, I guess, for my starting out. In some sense, the article that I wrote talked about how I felt that our young people were being colonialized and not really educated in a proper way. OME had become a farce, devoid of educational meaning. I wanted to notify the new administration that I felt that in this whole discussion or statement about diversity and progress, etc., these issues had been discussed. I wanted to make the point, and I think I made this point at the end of my newsletter, that basically there was nothing in it that I wanted for myself, that I didn't really need to talk to them, I didn't need to negotiate anything with them, they didn't need to concede anything. I was simply informing them that this was the deal and this was the level to which I was going to go to inform them. That was really the basis for that move.

Just let me say at this point that I have to compliment Chuck Vest because on the very first day when all of the news media and all of the local TV stations and the AP and UPI wire services and everybody else were out there and all this activity going on, I was standing there and I had noticed up to that time that most of the administrators around his office were looking at me and shying away from me and frowning at me. Then someone put his or her hand on my shoulder from the back. I turned around and it was Chuck Vest. He reached out to shake my hand and we shook hands. And he said, "Is everybody treating you okay?" That was

his statement. The point is that his response to that demonstration—that is, not to personalize it and take it as a statement against him personally—just really relaxed everybody, put everybody in a different frame of mind. He certainly made it very non-confrontational, and I think in some ways he made the thing a success. He could have assumed a very different posture, and I think that the outcome could have been very, very different, primarily in a hostile sense.

It was a courageous act and I haven't seen anybody in our community do anything like that since I have been here.

Well, from my perspective, I interpret the words "courageous act" in the sense that the one thing that one doesn't want to do in an academic community is to make a fool of oneself. If you jump out there and if you do something that's very different and very offbeat, it can go wrong in the sense that you can make a fool of yourself. The one thing that I don't think happened is that people felt that I made a fool of myself. There were lots of people who came and talked with me and supported me, including you. I appreciate that. The black faculty at Harvard sent an administrator to express their collective support. They sent a representative down with a long letter that had been signed by many of them and a statement of respect and support. I got support from faculty colleagues, some of whom were from mechanical engineering, but also throughout the School of Engineering and throughout the Institute. There of course have been colleagues in mechanical engineering who have never acknowledged that or said anything about it. Indeed, I don't even know whether they read the article in the *Faculty Newsletter* or saw anything about it, but as far as I know, they've never looked at me or said anything about it. So I've been ignored by colleagues who are professionally very close. But still, in essence, the protest galvanized a lot of support in terms of the expressed goals.

Based on your own experiences, is there any advice you might offer to other young black faculty members who are entering or planning to enter the MIT environment?

That's a tough one as well. Again, this is only my perspective, it is not *the* perspective, for sure. I think it's important for young black faculty members and graduate students also, in some sense, to be aware of the fact that this is a professional envi-

ronment that does depend in many respects on the assessments and evaluations of others. First of all, you have to be prepared to work extraordinarily hard, to be very, very good at something, that is, that thing that you claim that you're good at. You have to be mindful of the fact that this is an environment, as I said, that is professional in the sense that it requires contact with other people, that someone needs to mentor you. You have to make contact with individuals. You can't simply go off and do your own thing irrespective of senior people who are going to be making professional assessments about you. You need to be respectful of their assessments, to realize that those assessments may not always be fair, and to be prepared to say—ideally in a very nice and professional way—when you think that they aren't fair. One of the things—it sounds so simple-minded—that bugs me sometimes when I see at least some of our students behave otherwise, is that it's really very, very important to say “please” when you ask for something and to say “thank you” when someone gives you something. That's very, very important. I actually think that part of my success in this environment is the simple fact that if someone does something for me, I say thank you. I acknowledge the fact that they've done it, and let them know that I'm aware of it. I think that that's important because there are not going to be a lot of people who are going to like you. You don't have to have a lot of them like you, but the few who do like you and who are supportive of you, you have to realize that they're human beings as well, and if people reach out to you and extend a hand and represent you when you are unable to represent yourself, then the least that you can do is to say “thank you” in response to that.

Over a long period of time of working with the faculty—black faculty and administrators—it seemed to me that the black faculty could do more in terms of producing their own black Ph.D.'s. I always used to wonder, “I know where this guy's heart is, but I haven't seen any.” Then finally I did see one and there were two, and then one didn't make it but it seemed like one finally did make it. I may have this wrong, but if I have, correct me.

I agree with what you just said. This issue of producing more of our own has to come in part from the student as well. That becomes somewhat complicated in an environment that is both as intense

and as exclusive as the environment in which we reside. It's a combination of issues and it's quite complex. It really is quite complex.

Have there been any differences you've seen with students you have coached, students you have mentored in the advanced degree programs, as far as black students are concerned? If so, what have some of those differences been?

Again, as I said, we're dealing with such small numbers that it is extremely difficult to generalize, but let me just use my department as an example. In a department such as mine—mechanical engineering—which has about sixty faculty members, each of those faculty members is working in a slightly different area. You can broad-brush some of the areas, but in general, each of us is working on our own individual research topics. While there is a little overlap, those topics are nevertheless distinct, at least at a professional level. People on the outside may see them as similar, but when you get closer, as close as we are, those are sixty different general topics that we're working on. That means if you have a few minority students coming into the department, what I first of all say to all students, undergraduate and graduate, is that your choice of research topic or study should really be first and foremost dictated by your interest, not by who is doing it. I've had many undergraduates who have come to me over the years who have expressed some concern or angst at the fact that their interests are different from their parents' interests for them. I nominally encourage them to listen to their parents, be respectful of their parents, but then choose for themselves.

So the point I'm making is that when minority students come into our department and I get a chance to talk with them, I first of all try to understand what their general interests are. Then if their general interests are different from mine, as is likely to be the case statistically, then I try to direct them to faculty members who I think are likely to be both in that area—interested in their interests—as well as who are likely to be sensitive to their needs and excellent mentors. I have directed a number of students in that way who were not interested in my discipline. In fact, even this year there's a young lady who is coming into our department who I thought might work with me, but she has chosen to work with someone else. So I have to respect that. Over the years, I may have a few minority

students who are working with me, and once a minority student decides he or she is going to work with me, I feel fairly confident in being able to say to that student, "If you follow me and work very hard, I will get you through." To the extent that students have made that choice and that commitment, I think I've done just that. But there have been students who have begun to work with me, who have then decided that they want to do other things or think in different ways. First and foremost, I want to respect them as individuals and allow them to do that. The point I'm making, I guess, is that it becomes very complicated because one is dealing with a very small number of individuals at this level when one talks about graduate students, for example, and certainly junior faculty members.

Do you have any suggestions on ways to improve or enhance the experience of blacks at MIT?

That's a tough one. The reason why I say it's a tough one is that I feel that it's a battle that I have already lost so many times on this campus. What I mean by that is the following. The battle, or the way that I have seen the battle, is that there should be some connection and strong understanding and appreciation of a minority community and how we can support each other, but at the same time, not to close ourselves off—in particular at the student level—from the broader community. I find myself battling with the undergraduates to get to know whites better—not to leave Chocolate City, but to get to know whites better.

Students and administrators and faculty may listen to me talk at different times, and they may say this guy doesn't really know what the hell he is saying. He's saying everything and doesn't know what he's saying. My message to students is going to be a very different one from my message to faculty or graduate students. My message to students, certainly those who come and who move into a living situation that is essentially all black and then who decide that they're going to go to class and they're only going to sit beside black students and talk to black students and get to know black students, I think that that's a major mistake. I'm typically against that. I think that minority students first of all need to have some sense of the history of minorities on this campus. That's why I'm so supportive of the project that you've undertaken. Minority students really need to understand that

there was a time when only two or three blacks came here per year. They need to understand that—when the total black population in the undergraduate body was a dozen. They need to understand the evolution, the effort, the struggle that ensued to change that. At the same time, they need to understand that one of the advantages to being here is getting to know people who are excellent in whatever it is they do, who are the power movers and shakers in their given fields. By and large, those are going to be white people. A few of them are going to be minorities, but they need to get to know white faculty members, study under those white faculty members, get to know them a little bit at a personal level, understand what it is they have to offer, the way that they think, because that will only enhance them in terms of whatever future activities they undertake in their careers.

That's my message to black students; that is, not to be too strong in enclaving or localizing themselves. They need to take advantage of the broader community. My message to minority faculty members is that we need to have a stronger sense of community, so that if there are some things that really need to be done within the minority community, we can go to the administration with a fairly unified voice and represent what those particular issues or goals are, and probably likely get support from the administration to change things or to enhance things in that way. That's basically it.

I hear it very strongly, not only in this session but I've heard it throughout your career. Is there anything you could say about Steve Crandall that you haven't already said?

Not really. The bottom line is that Steve has been an unflinching, unfailing supporter. I've known him both as a student and as a colleague. I was his student. I guess one of my favorite stories about Steve Crandall is this one. When I was beginning to have my demonstration in 1991, the fast every Wednesday in front of the President's and Provost's office, because Steve had been so supportive of me and I know he had monitored and mentored my career and my promotions throughout the year, I felt obligated to let him know prior to doing it that I was going to protest because I didn't want him to hear about it without my letting him know. So it was out of a sense of obligation that I

wanted to let him know. I went into his office to inform him that I was going to protest, and I think I may have even showed him a little piece of what I had written, but only a small portion of it; and he disagreed with me. The door was closed and nobody was in the office but him and me, and he and I argued vehemently for the very first time. He and I had never raised our voices at each other before that day. I walked out feeling a little upset. I had tears in my eyes, but I was going forward. I did go forward. Then, on the very first day, when I got into my protest, I looked up and he was the very first person there to support me.

That's a beautiful story.

Tears came to my eyes then, too. That's who he and I have been. We're capable of saying whatever it is we need to say to each other privately, but when it comes time to go public, he's there. He was the very first person that I looked up and saw and that

made a difference. It really did. He made a difference in terms of that protest in that sense, and Chuck Vest made a difference in the sense that I've already mentioned.

I have to say that's the best example of truly being committed to a person that I have seen here in my twenty-three years. I remember one time there was an issue that was raised and it seemed like there would be some difficulties. He called me and he wanted to know if there was anything he could do. I knew where his heart was, based on a lot of things that you had said and things I've seen. That's the best example I know of a mentor at this place.

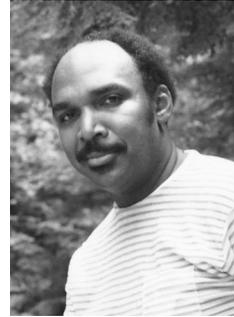

In that sense, I think he has set the standard. He sets the standard. That's the story about him. As I said, he will tell me exactly what he thinks when he and I are private, but when we leave the room, he's there. I don't have to look behind my back. If he's there, I know my back is protected.

Professor Williams outside the MIT president's office, April 1991, protesting the Institute's "neo-colonial" treatment of black students and lack of progress in recruiting black faculty. JOHN A. MIMS

b. 1940, BS 1966 (education) Chicago State College, MEd 1976 (student personnel services and administration) Harvard University; assistant director of undergraduate admissions, Chicago State College, 1966-1968; MIT, 1969-1975, with special responsibility for minority recruitment; associate director of undergraduate admissions, Yale University, 1976-1980; director, Talent Search Program, 1980-1985; budget assistant to director of programs, 1985-1986, and outreach supervisor, 1987-1988, California State University at Pomona; associate director of undergraduate admissions, University of California at Davis, 1988- ; member, Commission on Human Resources, Committee on the Education and Employment of Minority Group Members in Science, National Research Council, 1974-1978.

John, this report on the minority applicant pool study. That was done by you, right?
That's correct.

And you said Lynne Richardson helped you to do it.
Lynne Richardson worked for me in the Admissions Office as a student aide. She would do some of the research and assist with some of the challenges.

How good would you say she was?
Better than me: great. I'm serious.

You are proud of so many students.
To start with, Lynne came from her junior year of high school. From when she was a freshman, she worked in the Admissions Office. She worked four years in the Admissions Office and had a desk outside my door. See, I'm not dumb in who I pick to help me. I figure that was one of the smartest things in the world I ever did. She used to write a lot of the speeches for the Black Students' Union presidents, then the boys would go out and give the speeches. She would sit back very quiet and docile-like, but she was never docile. Never be confused, okay? But she was very lady-like.

Very kind, but as tough as nails under those tears.
You got it, under the tears. She had a lot of pain. Do you know her mother passed away, her aunt passed away?

While she was in school.
And when she got ready to go to medical school, the reason she picked a school in New York is because she wound up being the surrogate parent to her cousin. She had a little eight- or nine-year-old girl when she went through medical school

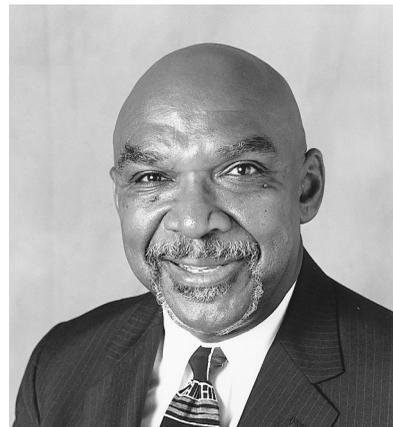

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with John A. Mims in Los Angeles, California, 13 March 1997.

who was like her little sister. But also, she was the parent for that girl. When she graduated medical school, this young lady was graduating junior high school and they had a joint party. And because Lynne played basketball, she coached the junior high school basketball team that this little girl was on while she was in medical school, so that they could be together. And she graduated on time. She's special people, period. That was a long time ago.

Let me come back to you. All of us knew a lot about you in terms of the job you were doing, at least when I came in 1972. But what I think a lot of people don't know is that you were really the first black associate director of admissions.

Assistant director.

You came in as assistant?
And I left as assistant.

I always considered you as associate. You paved the way for a lot of folks. But the point is that you were the man in that Admissions Office, certainly for us and for others who didn't know it. You set the stage for everything that has happened since, in my opinion.

But before we get to your actual work and experience you had there, where did you grow up? Tell me something about your family and your pre-college days, and what you did after you finished high school.

I didn't know it when I grew up, but I was brainwashed to go to college the day I was born. I say that looking back in retrospect, and I mean that.

I was born in Boley, Oklahoma. It's an all-black town. The reason it was black is that when there was the rush for land, blacks were not allowed to settle in white territories, so they went out to territories that the whites did not want. And that's what Boley is, an all-black town. In the 1920s, it was like twenty-five hundred people, with several banks, stores, its own schools. The people in Boley ran their own schools, so you had educated black people who told all of the children, "You will go to college." That's where my uncle grew up. That's why he and many of his brothers and sisters went on to college in the 1920s, because that's what they were expected to do.

I have five brothers. There were six boys and a total of twenty-one brothers and first cousins. Out of the twenty-one of us who came out of Boley, one way or the other, nineteen of us went to college all during the 1940s, '50s, and '60s. That's primarily because we were brainwashed that we were going to go. That's something at one level you don't take credit for, if you understand what I'm talking about. I look around at the reverse. The next generation that grew up all over the country, only half of those young people went to college. Some are in jail and some are in other places. The further we got away from that Boley legacy, the fewer people were successful.

Who was responsible, would you say, for that major achievement of going beyond the typical educational process?

My mother and father strongly believed in education. My father went to Hampton in the 1920s. He led a student demonstration as president of the student body. They took his scholarship away, which was the same as expelling him. He didn't graduate, but he punished them—he sent my three oldest brothers there. One of my brothers taught there. I've got two sisters-in-law from Hampton.

So you have a real tradition, family-wise, at Hampton.

In some ways, yes. What happened, though, was that when I was a senior in high school, I always assumed I would go to college, but my father had a heart attack in April. After that heart attack, he was only working half-time for the next year or two. So I went to the military after high school, I didn't go to college. I went to the military and spent two years in Germany. That exposed me to German. When I went to college, I wound up taking four years of German and was president of the German Club.

When you came back you were fluent?

Yes. I had a very, very serious disrespect for the French, who were nasty to everybody even in the 1950s and '60s. They were not polite to you from the first day you got there. Strangely enough, while there was some racism in Germany, there were lots of Germans who were far more friendly. I enjoyed Germany a lot more than I enjoyed France.

What years were those?

'59 to '61.

So when you came out of the service, how did you decide what school you were going to go to?

Purely luck. I came out and I was working in Detroit trying to just go to school and do everything on my own. I was twenty-one and I was going to do it all on my own. I was going to night school at the University of Detroit and I got a job at a ham factory, stuffing hams into the plastic bags. I didn't realize that that factory was setting up for Easter, so at the end of January they laid us all off. I thought it was a permanent job. I didn't realize they had no intentions of me working there permanently. When I got laid off, I also wound up being forced to work overtime—chose to work overtime—and missed my finals. So I flunked my courses at the college I was going to and got laid off the next week.

That's when my uncle told me that my parents had moved to Chicago, and he said it was time for me to go home and go to school. I moved to Chicago and in September I started at Chicago State. Four years later I graduated. That's when I considered myself lucky, because my parents were there and I could just go home and go to school and graduate on time, with support.

When I was at Chicago State, I worked on the newspaper and wound up being editor-in-chief. That became political. It was particularly

interesting, since at that time Chicago State—which was really Chicago Teachers College and Teachers College South, with a couple thousand students—was about ninety-eight percent white in the middle of the South Side of Chicago. Being editor-in-chief of the newspaper meant that there were three blacks on the staff, and you had to figure out how to politic to get there. It was also in the middle of the '60s, with demonstrations and riots and a whole lot of other things, so they were some interesting times.

When I became a senior and registered to graduate, originally I was going to graduate late because I had a stipend to go to Germany that summer. I had taken four years of German, but I decided in February I didn't want to go to Germany in the summer because it meant I would not graduate till December. So I changed my mind and said I would take summer school for my second teaching course, because I was in special ed. I did regular teacher training and then, in the summer school, I would do my special ed teacher training and I would graduate in August.

The day I filled out the papers to do that, the dean called me up and said, "I want you to come in and talk to me." I said, "About what?" He said, "Well, we have a position on campus I want to talk to you about." I said, "Fine, I'll be there on Thursday." I hung up the phone and then I thought about it and called him back, saying, "You have a what? I'll be in there in the morning." This was Monday night.

So I went in, and what he basically did with some money was hire me to work in Admissions. When I started to work in Admissions, there was only one other black working in college admissions in the state of Illinois, and that was at the YMCA College in Chicago. The only other non-white person was an Asian-American, who was the director of admissions of a two-year community college in Evanston, Illinois. Everyone in Admissions was white at that time, in 1966. When I started to recruit, what would happen was that I would visit a high school and discover that while there were white recruiters, most of them had never visited any of the black high schools in Chicago. So when you would show up, people would be surprised that a college rep was showing up.

Those were some weird times. The biggest advantage I had was that the Admissions Office had not hired me, the dean had hired me. The

Admissions Office had never recruited anyone but white students. In fact, I walked into campus one day and no one was in the Admissions Office. I discovered they were having a counselors' meeting upstairs. I went upstairs. There were a hundred high school counselors, and not one of them was from a predominantly black high school. Right on the campus of the college was a high school that was predominantly black, and not even that counselor was invited to the meeting.

So this was very deliberate, what they were doing in the mid-'60s. This was not by accident. They were busy showing how the university was hiring two attack dogs with policemen to guard the student parking lot, so that the white students would be safe when they came. Chicago State at that time was in the middle of a predominantly black area, but again, the school was ninety-seven or ninety-eight percent white.

And that's when I started to work in Admissions. I went to a meeting one day at a junior high school. There was this assembly to talk to students about going to school. There was a gray-haired white man on stage interviewing this little black kid. I walked in and wondered, "What is that old white man doing up there?" I sat there and watched him interview the kids and, by the end of that session, David Dudley was my mentor and I understood why he was up there. He was absolutely phenomenal in the way he worked with young people.

We worked together on the Pullman Foundation. The Pullman Foundation would give scholarships to minority students, black students primarily, in Chicago. David was on it. I got on it because he invited me on it. He was the director of admissions of the Illinois Institute of Technology. We worked together there for another year or so, and then one day David said, "I put your name in to some friends of mine and they will be calling you." I said, "Where?" He said, "At MIT." I said, "Why?" He said, "They're looking for a black admissions officer, and I recommended you." I said, "Where's MIT?" He said, "In Cambridge, Massachusetts." I said, "Is that a good school?" At that time, I had never heard of MIT. He said, "Yes, it's a fairly good school. I think you'll like it."

So Roland Greeley called me, and they flew me out and interviewed me. After the interview, I was offered a job.

Who was involved in the interview?

Roland Greeley, Julie McLellan, Pete Richardson, Sam Jones from financial aid, Dan Langdale, and Peter Buttner. That's where I met all those guys, right there during my interview. All those folks were right there leading the charge.

Do you remember anything striking about that interview?
I think so, yes. For one thing, I had rented a car. It was my first time to Boston. We rented a car. I think I left the keys in the trunk when I was going in and it got stolen. That's one of the things I remember, that the rental car got stolen while I was in interviewing. I had parked it on Mass Ave.

I remember I was supposed to stay at the Garden Hotel in Harvard Square. I drove around trying to find that one little slip that you get in to get to it about five times, and finally my wife, who had come out with me, got in a taxi, I drove the car, and the taxi took us to the hotel because we couldn't find it.

Everyone was friendly—very, very friendly. They were laid back. This was the end of September, and I told Roland Greeley, “I just started working and I'm naive. I just started doing the recruitment and I sure don't want to stop the recruitment season. When do you want me to come?” So he says, “Why don't you come in January?” So I said, “Okay, I'll come in January,” and that was a done deal. I was offered Admissions at the end of September to start January 1.

You were offered the job after you were interviewed, while you were on the trip?

We were talking about that basically, yes. See, one of the things that happened—and I didn't know it at the time—was that I basically had the job when I came unless I messed up. David Dudley was previously the associate director of admissions at MIT.

He knew about MIT because he worked there.

Not only that, but David Dudley was also the director of admissions at Columbia University for a number of years. He's part of the “Eastern establishment” in that sense. So when he recommended me, I was innocent till proven guilty, quite frankly. I didn't realize it, but the job was mine unless I messed up. That was the old boy system. They didn't interview ten people. If they liked the first candidate, they took him.

That's who David Dudley was. He was a phenomenon unto himself. When he was at Illinois

Institute of Technology, he was the affirmative action program. He did all of the tutoring for the black kids who came into that school. He was their STEP, their summer program, and he did all of those things. He tutored them in anything they needed.

You've been offered the job, you accept the job, and you come into this strange place that you really didn't know that much about at that point. Do you recall coming on that job in January and what you were really faced with? In a couple of months there, you were the person they were going to depend on, I suspect, to change the whole culture of this place.

I do remember some of that. I remember Jim Allison. I met him during the interview and he was one of the most helpful people to me, one of the few black people I met who talked to me. When I came in January, the first week I was there, the students officially came to my office and asked if I would come to a meeting on Sunday at, let's say, three or four in the afternoon. I came to that meeting at three or four in the afternoon, and they grilled and interrogated me.

Had that ever happened to you before?

Never—no, no, no. At the end of the meeting, they were very formal and they said, “You can leave now.” I was shocked. I said, “I beg your pardon?” They said, “This part of the meeting is over and you can leave.” What I discovered, and what I did not know and what the administration had not told me, was that in October the students had come to the Admissions Office and said, because this is what was happening all over the country, “We demand that you hire a black admissions officer.” The director of admissions said, “We've already hired him.” “What do you mean you've already hired him?” “He'll be here in January.” So they said, “He's coming in January and he was hired by white people? He must be no damn good. We don't trust him and he's an enemy.”

It was January 1969 when I showed up. I thought the day I walked on campus the black students would be the best friends I ever had. What I did not know, and there was no one to warn me of this, was that they were my worst enemy because the day I walked on, they did not trust me. I was already hired and they didn't get to interview me, and I was being hired by hostile people who they thought were negative people. So I had to be no good.

I didn't talk to a lot of the black faculty members at that time. There weren't a lot of black staff. What I do remember very vividly was, maybe six months after I had been there, that I came in early one morning around 6:30 to get something in the office. During the day shift, when you walked through MIT in early '69 or '70, you would see custodians all over the place. There were one or two black custodians, but there were hundreds of white custodians. I walked in at 6:30 one morning—I was in the basement—and I saw a hundred black custodians. They were all on the eleven to seven shift. They did the heavy cleaning and left before anyone showed up to where they could be seen. That was culture shock for me. That just blew me away. I was not prepared for that.

The other thing that happened was that when the black community of Boston discovered that MIT had hired an outsider, they were furious. The people in Boston said, "You mean to tell us out of all the black people in the city of Boston and Massachusetts, you have to go outside the state and you have to go halfway across the country?" They were livid, literally livid—and hostile, I might add. There was a lot of anger there.

When I tried to find a house or an apartment—I was going to rent first to see what we had—it's a long, long story, but the discrimination in not recognizing where you can and cannot live was there. I had a young cousin with me. I made a decision, since he was in elementary school, that I wanted to find a decent school system. What I discovered in Boston was that in the black community all the teachers were white. There wasn't a black school system with black teachers. It was black students being taught by white people and most of those kids were not learning. So I made a conscious decision to move to a school district such that if this kid were to be taught by white folks, it would be in a district where the kids were being successful. That's when I decided to rent in Newton, which was ninety-eight percent white.

That was a problem there. We started to join a black Baptist church in Roxbury, and they immediately came to the conclusion, "Since you live in Newton, you must be rich, wealthy, and have no problems, so therefore you can solve *our* problems." Pretty soon I found a black church in Framingham, where we were suburban people with our own problems and everybody was fighting to survive. No one assumed you had it made,

because you were getting hit upside the head all the time with the problems you had wherever you lived, and the fantasies were not there.

Those were some of the problems. One of the other things that happened, we started networking in Boston and different people would get together at the colleges. David Evans was at Harvard. He would invite all the black college admissions people over for lunch, and we would sit and talk. Then Brandeis would invite them over and they would talk. Then it happened on my watch. I was having a luncheon and I had a budget, I might add, so we had a number of black people in the community over that day. We probably had twenty-five or thirty folks for lunch. There were a couple of the state colleges and some smaller colleges in the group. Finally, they couldn't take it anymore and the blacks stood up and said, "I'm tired of you guys showing off. We don't have budgets, so we can't afford to invite you to our schools, and all you do is flout your damn wealth." The anger—and I had been there less than six months. I thought, "I'm using this stuff for black folks. I thought this was great, and *bam!*—you get slapped upside the head by someone who doesn't have it who thinks you're showing off." So you got attacked by many sides.

Then what happened, the problems came out and it was not just admissions. The black students who were there in '69, the campus police were not used to seeing them on campus, so when the students walked across campus they would get stopped, sometimes two and three times the same night by different police officers. The kids were hostile because they were being stopped and harassed. And it's, "We know you're not a student here. I'll let you up slowly so you can show me your ID." The kids were always at that time, angry and hostile and not very happy about what was going on. No one really accepted the fact that there were that many black students walking around.

In January, February, or March of '69, one of the graduate schools called me up. I got to the meeting and they said, "You're in Admissions: do you think we should admit these black students?" I looked at them. These folks were asking me whether or not we should be admitting black students to master's and Ph.D. programs. I'm saying, "I don't know. I don't have any idea. I can hardly figure out how to get these kids admitted to cal-

culus downstairs as undergraduates, and what the parameters are.”

Those were mind-boggling times that were coming up there—the different people with all these expectations, people calling you up and saying, “Oh, you’re black, we want you on the committee. We want you to come in here and do this and we want you to do this. Tell us what you think about this.” All of a sudden, you were an expert for everybody. That’s when I went to the dean of the Graduate School and suggested that they needed to hire someone in the Graduate School office. He was not receptive to it at that time.

I went to that Council meeting. All the people from the departments were there. When it came time for new business, I raised my hand—the only black person in the room. The dean of the Graduate School was there, and I said, “Excuse me, sir. I would like to recommend that, with all the problems coming up, you hire someone in the Graduate School who is black.” The dean hemmed and hawed, and he finally said, “Well, this is not the appropriate body to discuss that. It’s a student affair. I think we should refer it to the Graduate Student Council.” One of the best things happened that day. A little white kid who was the president of the Graduate Student Council stood up and said, “Sir, I don’t think we’re qualified to deal with that,” and he pushed it back on the dean. Instead of “Yes, I’ll take it,” the dean was hemming and hawing.

So what happened, the dean tabled it. When I got back to my office, five of the advisors for the departments of the Graduate School were down in my office saying, “Yes, I don’t know how to deal with these black applicants. I would love to find somebody to do that.” Out of that discussion, we wound up deciding to have a search committee and the dean agreed to hire someone in the Graduate School. After a long and exhaustive search, they made a decision and some dude from some place showed up. His name was Clarence Williams. You might know who I’m talking about.

I might know who you’re talking about.

I’ll tell you, Clarence, I don’t know if you know this or not, but once they had interviewed the candidates, I talked with you.

Yes, I remember.

Because I was on that search committee, when it was all through, they would send them by me. I

got this one fellow—one of the finalists—and he said, “Boy, am I glad to see you. Tell me something. Can you get tuition for your kids while you’re here?” That was the first question out of his mouth. I’m looking for somebody to cover my back at the graduate level, do you hear what I’m telling you? This fellow had no idea that he was the last person on my short list. He was like, “What can I get out of this place?”

The good part about that—and I say this in testimony to you, quite frankly—is that a year later the dean deliberately came to see me and said, “I think your fighting for this position was a good move.” I was always leery how folks like that might then stab you in the back and try to get rid of you and do you in. I felt very good the day he told me that and we could move on to something else, at least I could. That was another weight off my shoulders. Those were the types of fights we had, if you would—trying to get people into different positions.

What was that group called, the one Paul Gray chaired?

The Task Force on Educational Opportunity.

The Task Force, thank you. We were at one of the first Task Force meetings in late March, early April. The black students were there, and let’s just say they wanted to know who were the students admitted. Some folks in the Admissions Office said, “We don’t know yet, because we haven’t compiled all of that information.” So they asked me, “Mr. Mims, when will we have that?” I said, “I promise you I’ll get it to you as soon as I can.”

When we left the meeting, I walked downstairs. Until that point, I had resisted wanting black students to read admissions folders, because I thought it was the responsibility of the staff to do that and we shouldn’t burden the students with it. I walked into the director’s office with some more key people in the Admissions Office, and I said, “As of right now, I’m lobbying to have students read folders, because I’m not going to be stabbed in the back or caught on the side of the Admissions Office ever again in a lie.”

The report of every black student we admitted, and who they were, was sitting on my desk. But a certain person in that office had decided they did not want the students to see it yet, so they said, “It’s not ready, we haven’t done it.” With students at that time walking in and out of my office, if they had walked in and seen that report, they

would have said, “You lie right along with the rest of those people.” I got mad at that. The last thing I wanted personally was to have students reading folders, but I felt pushed into it. I said, “I’ll never be caught on this side here to where I’m sand-bagged like that.”

It’s part of that whole scenario when you first came and you had to develop a strategy to try to recruit numbers that we had never had before at MIT. When you go back and look at the time when black students started coming into the institution, at the time when you were hired and the numbers began to have some consistency, you were expected to do a lot of things. Pressure was on you to come to that Task Force every year and indicate some progress relative to these numbers.

Yes. One of the things that was clear was that the students wanted to do something. One of the things we did in those first couple years was lobby and send lots of students out to recruit. It’s a very interesting thing—most of those students came back and said they didn’t want to go anymore. This was in ’70, ’71, ’72. You see, there’s one thing—and the same thing is true today in the University of California system that I’m working in—most black students do not want to believe: “You’re telling me I’m one of the few people who looks like me. I don’t want to be special. I’m normal. You can’t tell me that in this whole country you can only get thirty, forty, fifty, seventy-five, or a hundred people. There ought to be thousands and thousands of folks like us.”

There is a pain that the students have. They would never say it publicly, but when they would come back, they would say it—“I didn’t really believe when I went to that high school that there were only two or three qualified kids who could really make it at MIT, and I didn’t know what to tell the rest of them.” It became very painful for them. While they would protest and make all types of public posturing, it was frustrating to them.

The other thing that happened is that we wound up having two black students. Keep in mind that at this time Latinos and American Indians and these other groups were not at the forefront of all this, and that’s why they were not discussed at this point. They were a decade away in some ways, five years to a decade away. They were not part of the primary issue at that time, even though we recruited them. One of the things I did was go to the College Board for data. I got ethnic data and other sorts of things that the College

Board was developing, so I could start looking at the demographics of where people were. Then we would go and recruit in cities all over the country. A couple of years I had ads in *Ebony* magazine. We would try to just throw it out there.

You developed some unique strategies that, at that time, nobody had ever done in the country. One of the things was something about busing people in.

Yes. Again, I have to say that the person who let me do all of this stuff was Paul Gray. The Admissions Office was not opposed to it, but Paul Gray was the one who came up with the moneys and protected us. In fact, when we were attacked for why we were spending all these moneys on this thing, he explained to the faculty one day, “This is not MIT money. We have outside separate funding for this, so none of your money is being spent on these new things.” The benefactor for a long time didn’t want to be known. I don’t even know if you know who the person was, someone from Ohio. In the late 1960s, an MIT alum from Ohio put up all of the moneys for all of the stuff we were doing. He never wanted credit for it, so I’ll leave him nameless.

A white alum?

A white alum. Paul had deep pockets for whatever he thought he needed to do. This anonymous white man said, “Go for it.” He’s the one who made a lot of things happen.

What happened this one year, I wanted to do a conference and bring two hundred students to campus. I brought 250 students, juniors, in June of ’72, I think it was—’72 or ’73. What happened was that from New York, Philadelphia, DC, and Buffalo, we took buses and bused the students to MIT. From Chicago, Atlanta, and St. Louis, we flew students in. From Texas, we flew Chicano/Latino students in.

This was based on the profile you had.

Based on the profile we got on these students, right. They were all very, very good students. I will never forget the budget Paul Gray gave me was thousands and thousands and thousands of dollars. Paul sat down, looked me in the eye, and said, “Out of these 250 students, how many are going to actually show up at MIT?” That stumped me. I looked at him and said, “Probably no more than ten percent.” He said, “Then why are we doing it?” I said, “To pay dues. We haven’t told the black community before that we care. Now is the time

to let them know we care. Some of these kids later on might even come to graduate school. It's exposure, and we're trying to let them know we have a commitment to them." He looked at me and said, "Do it."

That was it, it was that easy. Keep in mind, all of the people—Julie McLellan and her whole staff, all of those ladies, all of these little ladies who worked there—most of them were white. There were a couple of blacks over there. I don't want to forget them. You know who I'm talking about? The ones who sat in what I call the two back rooms over there. They made all of that happen. None of their kids were coming. That's what's so special about it. All these folks made it happen.

We flew those kids in, we brought them in on buses, and what happened was that each department had a special show-and-tell. Doc Edgerton agreed to do his show. Cryogenics had a show for doctors on the freezing of blood. Oceanography had something. At that time, they were looking at an oil spill off the coast of New York City, and that was the research they were doing there. Each department was pulling forth some of their best professors and some of their best show-and-tell for these kids when they got there.

We went for a couple of days and went through all of this. Because the students had left campus for the summer break, the high school students lived in the dorms and ate there. One night, about thirty of them decided they were going to go to the Prudential Building, and that's when I decided I needed to walk with them. All of a sudden, that was a new role. I hadn't quite done all the planning on security at night.

A year or a year and a half later, I did a report. Twenty-six students, eventually, out of that group came to MIT. But like anything else, out of that whole group, I got a letter that a lady had sent for her niece to the MIT president, complaining about the non-commitment to black students during this trip. I'm going to tell you how things always bite you where you don't want to be bit. This was a little girl who showed up in the office and who was a B student, who was not going to be admitted, and where she was coming from, I had three empty spaces on the bus. I told her, "When you get back to your city"—she came in at five o'clock one evening to talk to me and she was going home—"I've got a trip coming up in a week. I'll put you on the bus, I'll bring you back up here, and I'll let

you see MIT." Her GPA was 3.0, and there was no way we were going to take her. She wanted to be a doctor. Remember that cryogenics and freezing of blood? We sent her where there were two MD's, and she had no idea of what they were, because to her they weren't doctors.

When she got back she wrote a complaint, and the person who was sponsoring her sent it to Karl Bynoe of the affirmative action program for the state of Massachusetts, talking about the lack of commitment that MIT had to helping minority students. I had to respond to that. What made it even worse, the bus that she was on was dilapidated, had no air, and it was a hundred degrees outside. That bus to DC was a Greyhound bus. After it left New York in June, the air conditioning went out and they could find no more Greyhound buses between New York and DC. They couldn't get them out of Philadelphia and Newark. So the driver, having all these kids on board, said, "I'm driving through and taking these kids home." That's what the girl complained about. The only one to complain was the one who was the least qualified. She had no idea. The director told me, "If you ever invite an unqualified person again, I'm going to write you up on that."

So that was what we did. The students each year would attack you for not admitting a hundred black students. A hundred was their goal. They would attack you, they would criticize you. But there were always enough students who loved you who kept you there. Don't ever be confused about that, but there was always a group beating the hell out of you every day because you had "no commitment to anything."

One of the things you talked about that you had probably a better knowledge about than anybody else is this whole thing about determining which student can really make it at MIT. You had to make some shots on that. I want you to talk about how you did that process. You understood what you were trying to get, that thirty or forty kids.

I would have to say the balance on that team was between Pete Richardson and Paul Gray. They were on the team. We always had another faculty member who read folders. The other person in the office who gave me a lot of insights was Bryce Leggett. He was a heck of a mentor to me. Roland Greeley was the leader, but Bryce was the intellectual philosopher who talked about things.

The question came down to this—and we still use it in Admissions today, it was very clear for black students—did you get the best grades where you were in the most difficult courses available? Then we could put less weight on the SAT's. A score of 550 in math was the minimum we would go to. But that kid normally had a 3.8 or 3.9. The truth of the matter is, that was not the normal admissions criterion for MIT.

One of the first things they did in the summer program, Project Interphase, was invite white students. What they discovered was that the 4.0 white kid with 1000 or 1100 SAT's, most of those students washed out. But if you had a 4.0 black student with 1000 SAT's, that student graduated MIT. If you had a white kid with a 4.0 and 1000 SAT's, they found it very difficult and normally did not graduate MIT. That's because those SAT's meant more for that kid than for our kids.

Let me tell you what happens right now, today. You go to the College Board. Right now, in 1997, the College Board will give you a graph showing that there's a direct correlation between SAT's and family income and ethnicity. The students with the highest SAT's are Asians, the next curve line is white, the next line is Mexican American, and the last line is African American. They go from \$10,000 income and below to \$60,000. The \$10,000 is here and the \$60,000 is here. It's as distinct as it can be.

That is an ethnic, culturally biased test, documented by the College Board. What it really amounts to, to turn it around, is that the richest people have the best chance of giving their kids the best education. That's really all it amounts to. It's not like it's prejudiced in that way. But the truth of the matter is, if you take someone who is \$75,000, \$80,000, \$90,000 a year, and they're college-educated, the vocabulary they use in the home is far more sophisticated than someone with a fourth-grade education. The books and things that the kid sees around him are such that the youngster growing up in that environment hears a whole different type of conversation at home. So it shouldn't surprise anyone that for the wealthiest, most successful people, their kids as a group have the best chance of having the highest SAT's.

So then, the few blacks who come out of these very impoverished areas and end up being at MIT, even in the '50s and '60s, are very rare.

That's right. Those people of any ethnicity are the exception to the rule. There are always exceptions to every rule. You will find a kid on welfare with 800 SAT's, but if you were to look at all of the people with 1500 SAT's in any group of people, the majority of those folks have over \$60,000 a year incomes. There's always an exception to the rule.

This is why, with the reverse exception to the rule, one of the things that made me fall in love with MIT in this sense was this. They had this kid who came to MIT—550 math—and he was in the Interphase program. The second summer he was there, I looked up and these stupid folks had him teaching math. I was livid. I said, "Boy, there's no commitment here." I went through and I watched it and I questioned, but then I watched the students who were coming out of this guy's class. And the kids were in total of awe of him, Sylvester Gates. Sylvester didn't have a 600 math score, and he ended up getting a Ph.D. Not only that, but the faculty there discovered he was brilliant as a sophomore. What happened was that he had taken the SAT's in his junior year in high school and never took them again. At first I thought, "They definitely don't know what they're doing," but I was never more wrong in my life. Those are the fun times, when you get those things.

There were lots of fights at MIT, from students, from faculty to staff. Students never trust administrators. We were in difficult times. Some students did trust you, though, and that was the good part.

He was the leader. He made it happen. Howard Johnson and a lot of other people gave him permission, but I think he took a big risk. It was not popular, there was no guarantee as to how it was to come out, and as a trained scientist, there was nothing in his background that said he knew how to relate. I think he was very special and unique for taking that task on and being committed to saying, "I'm going to do it and I'm going to do it fairly."

We came to a point, and I think you were there, where the Task Force was almost terminated. Paul went from September to February or March hearing some major lies. He stuck that out before finally the students came forth and said, "We were trying to be political. We didn't think it would go this far." I might add that was also one of the worst nightmares I had at MIT. In a September meeting, I walked into that meeting

and the students said, “We did not agree to have the Office of Minority Affairs in that office. We wanted it in this office and we never agreed to have it in that office.” And Paul Gray said, “Yes, you did.” I was the only administrator in the room who had been in the June meeting. Paul turned to me and said, “John, what do you remember?” I said, “They agreed to it.” The students looked me in the eye and said, “No, we didn’t.”

I walked out of that meeting and there was a senior black faculty member, to whom I said, “May I talk to you for a minute?” He said, “I have nothing to say to you.” From that September until February, we didn’t talk. We had several black caucuses talking about these things, and that faculty member stood with maybe a hundred black people in the room—you might have been in the room that day, I don’t know if you remember it—and he said, “There are some black administrators who are so desperate to have their little jobs that they will say anything the white man tells them.” The students sat there and laughed like crazy, knowing doggone well who they were talking about.

One of the things that happened at that time, which was very painful, was that Hayward Henry said, “I want you to come to my black history class and talk to the students about it, because they have been talking about you in class.” To his credit, when I walked into his class, he said, “Here’s the brother you’ve been talking about. I’m going to leave.” He did not stay there. You know how somebody could sit in the back and heckle and do a whole lot of other things one way or the other. I walked into a class of about twenty-five black students, and he turned them over to me and walked out. I learned something from him. I hadn’t expected that, but it is something I will always remember.

I talked to the students that day, gave them my perception of what happened, and that this was what we were doing. Many of them who weren’t involved in anything sat there and listened. But they were confused because their student leaders were telling them, “This is a lie.” We had walked into a February or March meeting and the first thing the students said was, “We were trying to be political. We didn’t know it would go this far. We didn’t know it would turn out like this.” The faculty member who had been talking to me and haranguing me all over the place turned around

and looked at me. At that point the kids said, “We agreed to it in June to get out of June, but we knew we’d get what we wanted in September.” Paul Gray said, “I’m glad to hear that, because I had come here today to close down all of these meetings permanently.” They had had it. The Task Force and everything else would have been terminated forever. Paul wasn’t going to sit through another meeting. That’s why I’m saying he went through a long period of allowing students to come to be accountable and responsible for their actions. A lot of pain went down through all of that.

When I left MIT and people discovered I was applying to Harvard Graduate School, the same faculty member who was in all those meetings came to me and said, “I would like to write you a letter of recommendation.” I will just sum it up by saying the letter was stellar. I always would like to think that that was his way of apologizing. He never did it directly, but I accepted it because it helped. I got to Harvard, and that’s a fact, in part because he wrote an outstanding letter. I didn’t even know me, in that letter.

That was a very tough period for you. I mean, you talk about pressure!

Now here’s what happens. You’re going through this with the black students and a whole lot of other black issues. At the same time, you have Admissions people who are saying each staff person reads X amount of folders on time. That’s where Bryce Leggett came in. Bryce meant it, I think, positively. He would say things like, “I don’t want to deal with those problems, so if you deal with them, I’ll read some of your folders. You go out there and play those games. I’m not so sure I can handle that, okay?” Particularly with Bryce, anytime you used profanity or M-F or racial slurs around him, he was through with the conversation forever. He was not going to indulge any of those indignities. We were at a conference once and the dean of Princeton—a black dean down at Princeton—talked one time about these issues. Bryce came back and said, “That’s what the students are talking about,” because he had heard it on his level. He would do things at his level, but he didn’t understand it and he wasn’t going to deal with it.

My biggest thing was that I never disciplined myself to do the grunt work. I’ve never disciplined myself, and I’m guilty of that. There are

reasons for that historically, I think. They're not excuses, they're explanations.

I also think that Pete Richardson had no idea of what that budget meant to a black person. They had given me a \$25,000 budget, and Pete, when he became the director of admissions, in his petty mind was determined, "I want to be in total control of everything in my office." He was going to take that budget away. It was not that I wanted it; it was that it was a symbol to the black community that they had a little piece of MIT and that the white man did not control every dollar. Pete had no idea of what that meant. That was the tragedy of it. He had no idea. That was a bond that the president had given to the black community; one man who had no idea took it away—"I want to be in charge of my budget, me, me, me, I, I, I." From my perspective, he was exceedingly narrow and selfish.

I walked out of his office one night and, when I closed that door, I slammed that door closed. I thought all the glass was going to fall out. That's when Julie McLellan came and said, "You know, when you disagree with your boss, it's time to move on." That's Julie, okay—"It's time to move on. He's the boss and you're not. Figure out what you're going to do next." From that point on, it was only me figuring out where I was going to go next.

I have one other story in this that I will tell. It was coming June of '75. I was interviewing for jobs. I went to Boston University to see the vice president of student affairs. I met him. He didn't have a job, but we were going to talk about creating a job. I sat in his office and he said, "What would you like to do?" I looked at him and said, "I would like to not work." He said, "What?" I said, "I'm tired of working." The Vietnam War was going through this. We had all the Vietnam protesters. We had every black demonstration you could have. From '69 all the way through '75, I had been working at the Institute with lots of craziness. I told myself, "I don't want a job—I want to go to school."

I got up from his desk and thanked him very much at 9:30 in the morning, got on a bus, went all the way up the street to Harvard, went into the School of Education, and said, "I want to go to college in September and get a master's." They said, "You've got to be crazy," because January was when everybody applied. I said, "I wasn't ready in January. I'm ready now. Who do I talk to?" She

looked at me and said, "You're crazy." I said, "I have to talk to somebody—who do I talk to?" She said, "Let me see if this fellow is in," and she called a guy named Charles Vert Willie. She sent me up to see him, and I talked to Dr. Willie for about an hour or an hour and a half. When I left, he said, "When you come in September, I will be your advisor."

I went downstairs and the lady said, "The last test is being given at three o'clock this afternoon. Go take it." I went down, walked in, registered, took it, filled out all of my papers, and waited all summer. Then I told everyone at MIT I was leaving.

In August, I was having a going away party on a Wednesday. Julie said Paul Gray kept asking, "Has he heard anything from Harvard yet? Will he be having a going away party not knowing where he's going?" Julie kept asking me, "Have you heard?" On the Monday, I had not heard and Paul kept saying, "Should I call?" He wanted to call, but he wanted me to do it on my own. On Tuesday morning, I called down and asked them, and they said, "The faculty have been on vacation, but they all signed off. We are typing your admittance letter right now and we will mail it to you." I said, "No, you won't. I'm coming and picking it up right now."

I ran outside, jumped in a taxi, went down to the Ed School, and walked in when they were finishing up the letter and getting it signed. I took my letter right there. That Wednesday I had a going-away party and they said, "Where are you going?" I said, "I've been admitted to Harvard, and here's the proof."

When I left in September to go to Harvard, one person came up to me at MIT and put his little finger in my face and shook it at me, saying, "Your job is to graduate Harvard on time." I looked at him and said, "Yeah, okay, I hear you." And he said, "Your job is to graduate Harvard on time." I said, "Clarence Williams, I hear you." And I left.

The next June, I passed all my courses. I was getting ready to graduate and I was waiting on this one educational research course. I called my professor and he said, "I don't know what you did, but you turned left instead of right on your research. Everything you did, while you did it all right, it's all in the wrong direction, and I'm not going to grade this paper. You have to do it over in the summer." I saw that finger pointing at me saying, "You have to graduate on time." I told

him, "I can't come over the summer—I have to graduate now!" He said, "I haven't got time for you now." I said, "You don't understand. I've got to graduate, okay?"

This was a Monday. We kept talking and he said, "I have to turn grades in at noon Tuesday morning." I went to his office at ten o'clock Monday morning and he said, "This is what you didn't do on the research here. This is what did not happen. I want you to do that and have it on my desk at eight o'clock in the morning. If you don't have it here, then I can't get it in on time for your grade."

At nine o'clock that same next morning, I'm due in New Haven, Connecticut, for an interview at the Admissions Office of Yale. So I went home and I started redoing all this typing and computing, but my calculator was out. I had fifty regression problems and stuff that I was sitting there playing with. A friend of mine, who is a mathematician, told me, "The way that's working, all you need to do is about every sixth, eighth, twelfth, fifteenth, or twentieth problem. You'll see the slant of all that research." I said, "Get the hell out of here. Leave me alone now. By the way, I'm coming by your house in the morning. I have a six o'clock train to catch to go to New Haven. I'm going to come by your house and leave this paper, and you have got to have it to my professor by eight."

I stayed up that whole night and did all fifty problems by hand. It took me that whole day and that night. Some time around four o'clock that morning, I finished the paper. I took a shower, I typed it up, I went by this guy's house and woke him up, and I said, "Friend, if you don't have this on this faculty member's desk at eight, I'm going to kill you." Of course, being a friend, he got up and got it there.

I got on a six o'clock train, tipped the conductor, and said, "Would you wake me up in New Haven, Connecticut?" I went to sleep, woke up in Connecticut, went to the interview—"Hi, guys, how are you doing?" That was it. I came back, called my faculty member that night, and he said, "Because your paper is late, I gave you a B-plus." He went in with those fifty problems and randomly worked out about a dozen of them in different parts of the paper. He said, "You actually did all of the work." He was shocked because he knew somewhere I had done it, but through random sampling he knew that if I got twelve right, the

rest of them were right. He said, "You really did it all, didn't you?" I said, "Yes." He said, "If you had turned it in on time, you would have gotten a better grade."

That was it. I walked to the phone, called my folks, and said, "I'm flying you up for graduation." And I graduated. I got a job offer at Yale and moved on. That was it. You said, "Graduate on time."

When you first went to MIT, who were some of the black administrators there and how, in your opinion, do you feel things were with our efforts in terms of administrators and faculty during that period?

When I came there, there were no black administrators, literally, dealing with any students on the academic side of the university. That was January, 1969. That June, Jim Bishop graduated. After he graduated and got his doctorate, he was hired in the dean of students office for September. A year later, Mary Hope came. A couple of faculty members, Frank Jones and some other folks, sat in periodically on the Task Force. Wesley Harris came and was perhaps one of the most involved faculty members on the Task Force. Then more administrators started coming. Benjamin Franklin Moultrie, in financial aid, was at all Task Force meetings. He came in September of '69. He's absolutely crazy. Ben Moultrie would do financial aid, and package those kids and help them and counsel them twenty-four hours a day sometimes. There were a number of African-Americans who were helpful.

Being very frank, though, the people who kept my sanity were Dan Langdale, Pete Buttner, Julie McLellan, and all of the office staff. The office would let you do the things you needed to do. There was Larry Huff in financial aid. There were a lot of folks like that, including the folks who read admissions folders. The first students who read the admissions folders were some of the brightest. For integrity in the way you read admissions folders, we bought them attaché cases. They would put the folders in an attaché case and lock it up, and it had to stay locked when it was in their dorm. They had the key so that they could take the folders to their dorms, but no one else could get into that attaché case. Warren Shaw and the two fellows from Atlanta read folders. The sad part about that is that every year a student read folders, the rest of the students would then distrust them and felt they sold out, because they didn't

admit all these people they thought they were going to admit.

The students saw all the information, they read all the folders. It was very clear to them who they should and should not admit, and they were wonderful. They kept your sanity. There were lots of students who came by and said positive things, too. There was Ron McNair. I was driving down the street in Compton and passed the McNair Middle School. There was a picture of him there. When I realized it, at the next block I pulled over and tears were rolling down my cheeks. What I remembered about Ron is that he would tutor the other graduates and undergraduate students. He was so unassuming and would always have time for them. That's because he was so bright himself. He was one of the few graduate students who put no pressure on. When I talked to him, he would help me relax. He would just say, "Hi, John, how are you doing?" He would remember your name. So when I saw him that day, that picture of him, it just blew me away. All of these feelings came back.

There were a lot of people around there, including stoic Shirley Jackson. She was serious. I think most of the time she mistrusted me, but she was fair. There were just a lot of people around there, a lot of folks. There were not a lot of black administrators. What bothered me is that we eventually got into divisions or camps. There were some people who I thought were very, very divisive, very, very negative, and who sabotaged other black people. I will leave them nameless. That was perhaps the worst part. In fact, one person was very busy organizing and holding small groups. He would come and say, "Why don't a couple of us get together to talk about how to solve problems?" What you would discover later is that this same person had four different groups doing that, and he was busy pitting one group against the other to see how it came out—to the point where, when some of the people left that experience, they didn't want to trust anybody. Yet you have to learn how to overcome that to move on to the next level.

There were lots of political issues. Sitting on the Task Force thinking about something, I remember a white faculty member who explained to me, "I'm against affirmative action, I'm against integrating my school. Look, I moved into a neighborhood that's white because that's who I want to live around. That's where I want my kid to go to school. That's me, and that's why I came to MIT."

That April, when softball season started and my little cousin was getting ready to leave my house in Newton to go play baseball, a kid ran down the street and said, "Hi, Elliott!" They ran off to the playground, and I looked up and there was the faculty member who lived a block and a half up the street from me. We didn't have to be friends at that point, because we both knew where each other stood.

I had faculty members who explained how, based on affirmative action, they hired two black girls in their department who were totally unqualified, and the white girls—secretaries—would have to do their work because these two girls didn't know how to do the work. It was the hardest concept for them to understand. Affirmative action never meant you hire unqualified people. They never could get that. When we blasted that home to them, they were taken aback. You're not supposed to hire anyone who is unqualified. Those were the types of frustrating problems you had. You would be on committees talking to faculty members, talking to students, talking about academic problems and getting those kinds of reactions.

One night, a young female graduate student was walking down the hall of Building 3 at eleven o'clock at night, looking like a zombie. I stopped her and talked to her. She was a doctoral student flunking out all of her courses. I called a black faculty member in a related science department, because there were no minority faculty in her department. When he got through evaluating her, in her undergraduate courses she had not taken three key science courses that you needed to be successful in the doctoral program. They had admitted her, did not tell her that, and that's why she was flunking out. They had programmed her for failure. The faculty member interceded and insisted that they allow her, and pay for her, to take those three courses before she started her work in that department, and that she should start it all over.

Those were the types of games that people could play. She was walking around thinking she failed on her own, but she didn't have a prayer the day they admitted her. You had some negative people doing things and you'd have lots of positive people doing things, and you had to balance all of this madness that was going on because you never knew when you were going to find it. That's what was happening back then.

Warren Shaw is an interesting guy—a CEO, the only black who is a CEO of a major investment company in New York City. A lot of folks have mentioned he was very supportive. He was a great mentor for them.

He was. The other two fellows from Atlanta were, too.

What do you tell a kid to be like in order to be successful? What are the things you have seen that made these kids like the Jim Gateses of the world? What have you seen in all these kids that have made them outstanding? I have seen many of them. A lot of them you admitted. I talked to Darryl Dawson out of Charlotte, North Carolina. He talked about you. There are a host of them. These men and women are doing it. If somebody in the next generation said—“What am I looking for here when I see this diamond in the rough?”—what’s your answer to that?

For MIT, you had to admit a student who had already been successful, so in some ways it was easy. We didn’t admit non-successful students. You read the essay, and one of the things most of those students learned early in life was to believe in themselves. They learned to believe they could succeed, and that’s why they did succeed. That’s why they studied, that’s why they read. Most of them had a support group. When you get through looking at all of it, somebody was pushing them. Those who did not have support groups and those who did not have people pushing them, fewer of them graduated.

By the way, this man who finished MIT in 1950 said exactly the same thing you just said: “You’ve got to believe in yourself.”

Yes, you do. That’s what I’ve seen with the students who came. I remember seeing a picture of Syvila Weatherford from Compton. Syvila showed up for the first Interphase with her mama from Compton, and I loved every minute of it. She was a little grown lady at eighteen, full grown. She had confidence in herself. That’s what I think it was. Plus, that confidence was translated in the fact that she actually studied and read all of the academic material when she was in school. She didn’t short-change on it.

My theory as to why we do not do as well as we used to do has several parts. Number one, the people who came through the 1950s, ’60s, and ’70s, while many of them have done great things, there’s a large number who have reached those glass ceilings. They have not been able to go as far

as they thought they would be able to go. The second thing I’ve got to list is that after Dr. King was assassinated, Malcolm was assassinated, and both Kennedys were assassinated, folks learned that if you talk too much, you get killed. I think since then a lot of folks have hidden and have gone into consumption without quality, so we strive for the Chivas Regal and we strive for the Mercedes and we strive for the clothes and we strive for the house, but we don’t strive to push the next generation further.

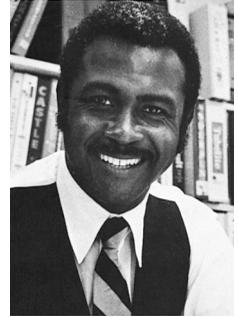

I’ve watched too many young people coming up today. I was at a college meeting last night with parents, and a number of students there who were on the honor roll with a 3.0, and who think they can go to most of the UC’s, do not understand today that most of them with a 3.0 are in the bottom four percent of the University of California’s class. They don’t understand what I’m working with right now in California, for example. There are serious misconceptions. Seventy percent of the black students in California who apply to the UC system apply to UCLA and Berkeley and one other UC, when you apply for three. The GPA’s at Berkeley and UCLA are 3.9. Then there’s “some little farm school,” as they like to call our place.

A little girl just told me, “You’re a farm school up there. Why would I go to Davis?” This is the University of California at Davis. But our median GPA is a 3.72. Again, less than four percent of our students are under a 3.0, and these kids walk around with a 3.2 like they can go anywhere in the world. It’s a false sense that is forcing us to do with mediocrity.

The other problem is that too many of our parents make \$80,000 and spend \$82,000, make \$50,000 and spend \$51,000, so there is no money to send kids to college. And lastly, I think we are in denial. We don’t really like to talk about how bad it was, and that’s what pushed a lot of people to a better understanding of how bad it was in days gone by. But we just don’t want to hear about it anymore. We want to cover it over or sugarcoat it, and I think that’s the biggest weakness we have that creates mediocrity, period.

HARVEY B. GANTT

b. 1943, BArch 1965 (architecture) Clemson University, MCP 1970 (city planning) MIT; lecturer, University of North Carolina at Chapel Hill, 1970-1972; principal, Gantt Huberman Architects; member, City Council, Charlotte, North Carolina, 1975-1979; mayor pro tem, 1981-1983; two-term mayor, 1983-1991; Democratic candidate for US Senate from North Carolina, 1990 and 1996 (against Republican incumbent Jesse Helms); chair, National Capital Planning Commission; life member, NAACP; recipient, Citizen of the Year Award, Charlotte Chapter of NAACP, 1975, 1984; Martin Luther King, Jr., visiting professor, MIT, 1999-2000.

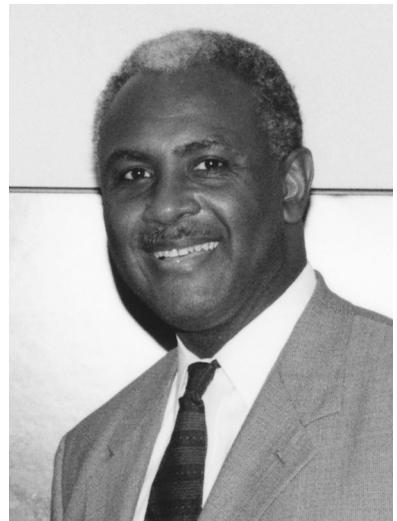

I grew up in Charleston, South Carolina. I was born in Charleston County. My father and mother moved quickly to Charleston prior to my first birthday. They moved into government housing—what we know today as public housing, but housing primarily built because of the war effort in 1943. I was born in '43 and they moved in '44 to Charleston. I lived in this public housing for the first five years of my life, playing in a neighborhood of working-class kids who lived in the projects. All of our fathers, as near I could recall, worked at something called the Navy Yard, which of course I learned later was in fact a major defense establishment geared to World War II. My father didn't get drafted because he was the oldest son in the family. For some reason they didn't take him for the war effort, so he ended up working in the war industries.

I ended up having four sisters, three of whom were born in that housing project. My father was a great reader, an avid reader, although he had only an eighth-grade education. He taught himself carpentry, as he worked in that Navy Yard, and picked up side jobs in the evenings and weekends doing carpentry work with a small black contractor. That led ultimately to his buying a plot of land in a small, salt-of-the-earth, working-class neighborhood. He moved my mother and my three sisters and myself to this very small house that he started building. I started helping him to build even back then as a six-year-old kid—just standing outside watching him, holding the lumber, maybe steady-ing it, calling myself getting involved. My father built the house with his own hands. Years later—as

we, his children, grew older—he added to that house, and I've often said that that might have been my inspiration to be an architect. Indeed, it represented my first instincts about how something went together.

We lived in this Charleston community and stayed there for the balance of my childhood. My parents still live there and I still go back. I suppose I had pretty much an average childhood. My parents sent me to kindergarten. I'm always amazed that they were able to send me to a private kindergarten back then. Daddy was still working two jobs, and there were three other sisters and later a fourth sister to come along. But they managed. Because they put education so high on their agenda, they managed to afford to send us all to this little kindergarten that was in the neighborhood. I would suppose that the tuition was probably not

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with Harvey B. Gantt in Charlotte, North Carolina, 20 July 1998.

terribly expensive. The good thing is that we got a good foundation, such that when we first went to public school, I felt very prepared. I did well in elementary school and in high school. We didn't have a junior high in those days. Elementary schools went from first to seventh grade, and then from eighth grade on you were in high school. But I did well and joined a lot of clubs and organizations. So did my sisters. My parents were very much engaged in the activities of the school. The school was three or four blocks from our house. All of my sisters did well, academically and in terms of involvement in social clubs. Also, I was an athlete in high school and played on the football team.

I suppose a lot of people ask the question, "Growing up in the segregated South, when did you first become aware of race?" But interestingly enough, we lived in our segregated community and most of us never can remember that as being a negative experience. We got to see the black doctor, the black druggist, the black preacher. Our parents we always questioned, how did these people get to be what they are and drive these nice big cars and live in these very nice houses which were right around the corner from our small house? But little did we realize that we were developing tremendous incentives to achieve, because the standard response that we got from our parents was that those black professionals had gotten an education, had gone past high school and on to college. So going to college became a natural kind of thing for a lot of us who lived in those neighborhoods at that time. Many of us ultimately couldn't go, but that was always seen as the goal—to do something and to do better than our parents did, and they wanted us to.

But race became an issue in 1954 for me, when the Supreme Court said segregation was unconstitutional.¹ Only then did I realize that we had been passing white institutions—like the white elementary school—to go the additional blocks to our elementary school, or that we sat at the back of the bus and never questioned it because that was just the way people did things. But when '54 came, it changed the lives of a lot of kids and our perspective and our outlook.

Do you recall what age you were?

1. *Brown v. Board of Education of Topeka, Kansas: Brown*, 347 U.S. 483 (1954).

I was eleven. I was an eleven-year-old kid who was in the sixth or seventh grade, but I remember that decision. I can remember the headlines even today, "Segregation Unconstitutional." The first thing I wanted to ask my mother was, "What does that mean?" Of course, she told us what it meant and my father reinforced what it meant. I started reading everything I could about it because I was seeing how the community was reacting. White people obviously didn't like it, from what I was reading, and black people thought this was a great day for some reason.

But nothing much changed in my life past that point. I mean, we didn't change any of our customs. We continued to go to the same schools and, as a matter of fact, I graduated from segregated institutions. The one big change was in our senior year, in 1960, when sit-ins started to occur in Greensboro at A&T State University, A&T College at that time. A group of kids in the high school, led by myself and two other student leaders, decided we would go sit down at lunch counters too, without telling our parents. We got into the act, demonstrated, sat at a lunch counter, got arrested and all the hoopla associated with that. But it was the best political statement we could make prior to graduating, that we understood that times were going to be a-changing.

This was in South Carolina.

This was South Carolina, this was Charleston. Little did I realize that that move would have an impact on my life later on. Let's just say that I ultimately ended up getting out of jail, as my twenty-seven other colleagues did, and we all ended up graduating from school. Later on the Supreme Court wiped that conviction off the books with their decision that our right to sit down at a lunch counter was in fact constitutional. But it was my first brush with the civil rights movement and I think changed my life substantially after that period.

With education being so imprinted from your family, from your mother and father especially, where did you go to undergrad school and how did that decision come about?

Well, I had great guidance counselors, who when they discovered that I wanted to be an architect—and I discovered that in about the ninth grade—didn't discourage me by saying that there are not a lot of black architects. They told me about the

schools that I could go to: Howard University, Tuskegee, A&T. But I had one guidance counselor who said, "Look, 99.4 percent of all the architects in America are white, and what you ought to do is take a chance and go study at an integrated institution. You ought to leave the South and go study somewhere else. You've got the brains to do that and you'll be successful." She kept encouraging me to do that, and ultimately I chose Iowa State University. I was a National Achievement Merit Scholar and got a scholarship to go to school out there. That, along with some student loans, allowed me to go to Iowa State. My family did not earn a substantial amount of money, although my father was determined to send us to school. We all knew we had to work and we all knew that scholarships would only partially help us.

I chose Iowa State and only stayed there two years. The cold weather didn't agree with me. Being a child of the South, I needed to come out and go somewhere else. I was motivated then to say, "Why not Clemson?" Remember now, I had already been introduced to the civil rights movement to some extent. I had observed Hamilton Holmes and Charlayne Hunter going to the University of Georgia in 1961, while I was a student at Iowa State University. I envied them, that they could now go to school in their home state of Georgia. "Why couldn't I go to Clemson?" So I applied to Clemson University. I did that in the latter part of my freshman year—that was 1961—and after going through the federal courts, they admitted me to Clemson. I was the first African-American student to go to Clemson University, the first African-American student in South Carolina to go to an all-white school. There was a lot of hoopla associated with that because James Meredith had just gone to the University of Mississippi the semester before I entered. Meredith went in September of '62 and the courts admitted me in January of 1963.

So I became the first African-American student, studying architecture there. I finished my undergraduate years in '65 at Clemson.

That's trailblazing.

I think one of the motivating things for me was, when I went there the first day, they said, "Oh, leave this kid alone. He's determined to get into Clemson. If he stays there long enough, he'll flunk out because architecture is a pretty tough course."

That just made me more determined that I was going to succeed. I graduated with honors in 1965.

Not only did you finish, but you finished with honors. With honors, yes. I was third in my architecture class. I was very pleased about that. My wife, also, was the first African-American co-ed to go to Clemson. She came a year after me. I always tease her about the fact that she saw this good-looking guy in the news clips and decided she was going to go join him, get him somebody to date. She obviously didn't graduate from Clemson, because when I left Clemson she left with me to move to Charlotte. We came to Charlotte after graduation. She finished her education at the University of North Carolina. I interned with a local architectural firm until I won a HUD fellowship to MIT. That's how I got to MIT in 1970.

Let me ask a question about the experience at Clemson, though, before you get to MIT. That was a very pivotal period in terms of your education and also, probably, a tremendous example for other blacks in the state especially. Did you stay on campus and how was that experience, being the only black male?

The only black on the campus for a while, for a year. It was a good experience. It wasn't nearly as bad as people thought it would be. I had prepared myself, I think, for some isolation—expecting that, expecting that students would not want to associate with me because of the notoriety, so to speak, that I had gained by crashing those barriers. But I found that I made friends rather easily in the School of Architecture. The professors were fair—some not friendly but fair, all of them were fair. Most of the students campus-wise, a campus at that time of only about seven or eight thousand students, were pretty much indifferent to my being there. I guess if you asked them whether they wanted me being there, they probably would have said no, that that was breaking a tradition that they held dear or their parents held dear. There were a few people who wanted to be negative, but I never encountered the kinds of things that some of my colleagues—peers, at least—at Georgia and at Alabama had encountered, in part because those other incidents had occurred prior to my going to Clemson. The state of South Carolina, from the governor on down, had made it very clear that they were not going to ruin their prospects of growth and development by having the kind of

thing that occurred in Mississippi, with the federal troops coming in. That passed all the way down to the president of the college, who said that any student caught out of line dealing with Harvey Gantt would in fact be summarily dismissed from school. So their manners were appealed to, more than anything else. Students had to stay in line because of the administration picking up a lesson from what happened in Mississippi. That inured to my benefit, and to the benefit of my future wife who came and got similar kind of civil treatment. We made a lot of friends at Clemson, life-long friends there both on the faculty and students I went to school with. In later years I went back to lecture and I received an honorary doctoral degree.

So that experience turned out positive. Today at Clemson, maybe at least twelve percent of its student body is African-American. I would say around a thousand-and-some students, twelve hundred.

That's a little higher than a lot of schools.

Yes, but thirty-three percent of the state's population is African-American, too. But it is a high percentage as compared to what you're finding in universities. Every time I see the kids in engineering and architecture, I have to feel pretty good about the fact that that legacy lives on and that kids are going to do well there.

Let me come back to MIT, then. How did you happen to come there? Reflect on your overall experience at MIT, particularly after so many very unusual experiences you had had before coming there.

First of all, I chose MIT because I thought it had a very good program in city planning and urban planning. I had decided—after the ending of my internship, three years here in Charlotte—that I wanted a bit more education, a master's degree at least but not a doctorate degree. I used to kid Phil Clay about this all the time. We both came out of North Carolina, but he was looking to teach one day and wanted a Ph.D. I said, "Man, I couldn't stay here that long. I'd go crazy being a scholar." But I wanted a master's degree in planning to complement my architecture degree. I wanted to work in cities and wanted to understand that work. Among the best schools in the country, MIT stood out. I applied and also applied for a HUD fellowship at that time. By now I had a wife and baby and needed some help. I got the fellowship and matriculated to MIT.

Totally different world, different from going to Clemson. Small town was Clemson, in the hills of South Carolina. Here we were in the hub of New England, Boston—you know the scene. I'll never forget. My wife kept expecting that Cambridge was going to be similar to Clemson or Chapel Hill, and what it was like was just an extension of the Boston metropolitan area. We had to make an adjustment to living in this highly urbanized area. Even though we had lived in Charlotte for three years, it's a relatively small town comparatively speaking to that area. So we adjusted. This was no new experience to go to an integrated school, but one of the most immediate things we noticed was the amount of protests going on at MIT and other places—the unrest.

What year was this?

This was 1968 and there was a tremendous amount of political turmoil. We saw all kinds of demonstrations in the streets. I became recruited to be a member of the Black Students' Union at MIT, with people like Shirley Jackson—who later made a name for herself at Bell Laboratories—and all those people. Phil and all of us were asked to come in and be a part of this. We used to go to meetings and listen to angry young black folks—many of them were younger than we were, because I had already been out of college three years—who were going to take over the administration building at MIT to make the faculty more responsive to the needs of black students. An interesting time.

It was a very tough time.

Such that when I read about some of the kinds of things we hear about today, some things still are the same, although I'm sure life must be better than it was back in '68. I got involved with that, but I had a kind of detachment. I used to see myself at BSU meetings being a person who folks looked to as a kind of elder person in the room, "Does that make any sense?" Some students were aware of my political history—being a first, a pioneer in the South. I used to notice a distinct difference between the Northern students and the Southern students. I used to share that with them. Southern students were much more hopeful about a better day coming, because they had seen and been participants in major social change in the region of the country that they had come from. So coming North and seeing some of the

things that existed here, we didn't think things were so bad. We had not felt the so-called hypocrisy of the majority race at that point. We thought up North, by right and by law, all men were created equal. So there was not the cynicism in Southern students. Again, we had this history of defeating problems in large measure. Recall now, by this time the Civil Rights Act and the Voting Rights Act had all passed and we were electing black officials to office.² So we went there with positive attitudes that we could conquer the world, whereas many of my colleagues and friends from New York and Boston and other places were substantially more cynical about what life was like there. They did not take faculty on face value when they complained, whereas we did. We assumed that they were going to make a sincere effort to make things better.

Life was tough in the sense that there was academic rigor at a place like MIT. I was always amazed at some of the kids who either studied very hard—and you wondered about the balance in their lives—and those who thought that they could scare their way through MIT by asking for all kinds of concessions during this period of political ferment. “I’m black, you know, and you can’t discriminate against me. Therefore, I don’t have to do that homework as much, and that’s not relevant.” So many things in that day and time were “not relevant.” But it was an exciting time, I suppose, to be in school. Those two years we saw some tremendous turmoil in the country—the assassination of King and Kennedy, the second Kennedy that is,³ and all the riots that took place as a result of that, the Vietnam war marches, what had happened at the Democratic convention in Chicago in 1968. It was one hell of a year to be a student because there was just so much going on.

Do you remember where you were when you heard that Martin Luther King, Jr., had been killed?

I was still living in Charlotte. I went to MIT in August of 1968. Well, I was going there all summer to get a place. I left my job in May, but I was still here in North Carolina. Do you know what I was doing? I was actually in Columbia, South Carolina, taking an architectural exam to be a licensed architect. I heard this news and watched a

lot of the stuff on television. I was finishing up an exam and becoming a licensed architect.

What experience would you say was really the best that you would say about MIT and what would you say was the worst?

Without any question, the best thing about MIT—and it still is prevalent today—is that you got to run into such fine minds, the intellectual vigor and energy they have, so many smart people. That’s a very stimulating environment for a confident person. It can also be a very intimidating environment. Some of my peers thought that that was what was wrong with it; I happened to find that it was exciting to be on a campus and sometimes take a course from somebody who was a Nobel laureate or someone who was nominated to be or someone who had won a major award. For me, I wanted to soak up everything I could from all these smart people. It was always exciting to me to be in a class with people who had written the latest book on housing or on political science. Or the latest book on city planning. Kevin Lynch—to be sitting in a course taught by a guy whose book was revered around the world. This was heady stuff. This meant something. The other part of it was this ability to take courses at Harvard, MIT, Boston University. I mean, if you were a student and a scholar, this had to be the environment to be in. To always sit there with people and they were always thinking, we could get into a deep discussion. If you were verbal, it was a great time—I mean, if you were the kind of person who wanted to talk.

The worst part of the experience to me was, in fact, that you could think that the whole world was like that. So it’s really the underside of the same thing. I spent time during the summer working at Harvard Medical School in their planning office, because I was a trained architect, just to earn a living. I spent another summer, a second summer, working in Roxbury in the middle of the black community. I saw how distant from the black community those worlds were, the medical school and MIT’s planning department. In that first year I could go to the sherry hour on Fridays with the faculty and hob-nob with those folks, but a lot of what happened there didn’t have much to do with reality. And so, with all of this brain power, why aren’t we solving some of these problems right around us? I guess I got annoyed with those of us

2. Civil Rights Act of 1964 and Voting Rights Act of 1965.

3. Robert F. Kennedy.

who were doing the theses—whether it was a master’s or Ph.D.—who went in to do analysis in these communities, but not always leaving behind anything of value to the folks who needed a lot of help. I was tempted at the end of my years in Boston by a number of people who wanted me to stay. I was tempted to stay, and I probably could have done well living up there, but I thought that I wanted to be in a world less academically oriented, where there was a little bit more normalized environment, where we could attack and deal with the problems that we had to deal with. The South, obviously, always beckoned to me. So I came back.

That’s a really excellent example, what you have said you liked best and perhaps some of the things that you did not like so much about MIT. My wife and I have been in the Boston-Cambridge area for twenty-five years, and we just recently—I’d say in the last three years—started coming back home, since both of us are from North Carolina. One of the things that you mentioned I wanted to get your opinion on, and that is, the South versus the New England area in terms of people—just the living. From our perspective, we love coming back home now simply because there is a Southern hospitality. We experienced it when we were growing up. Then to be away so long, and then you come back and you really say, “I really now understand.” What could you say about that?

Well, I think there are these cultural differences. There are these geographical differences between North and South, in this case New England and the South—or North Carolina. I’ve gotten accustomed to and I still am accustomed to walking around shaking hands and greeting everybody I meet down here. People are friendlier, white and black. Black people more so, but white folks here are friendlier too. They will say hello to you and they are very hospitable to you. You go into a business establishment and people are generally friendlier. Sometimes my friends from the North are shocked by that, because their image of the South often still is colored by the segregation days. I explain that like James Baldwin explains it, which is that in the South black folks and white folks live so relatively close together—and their history is so intertwined together—that they feel like they know each other and they’re never off each other’s minds. So even though we used to “know our place”—it’s a strange thing to say—there was just this civility, this relationship that we had. Now it’s

better. Let me tell you why it’s better: because a lot of folks are realizing that we have to strip off that patina of racism that held the whole region back. In the past, they were trying to hold blacks down and really keep the whole region back. With the legal-social and political structure changing so dramatically, coupled with healthy economic growth, there is a new positive outlook. And yet we haven’t lost the things that folks used to say were good about the old South. “Y’all come see us now, how y’all doing?” That’s still a part of us here on the street. Where high finance and big business are existing side by side, you still have that kind of environment of courtesy and warmth and friendliness. That’s what’s attracting many of my friends back to the area.

They say, “Yes, things are breaking down. Harvey, you ran against Jesse Helms in 1990 and 1996 and lost by only three or four percentage points? Wait a minute, this is the South! That ain’t supposed to happen.” Yes, it is, and it will happen. I mean, there’s racism still here. It’s here, but it’s not a legal thing any more and those who want to be on the progressive side know that things have changed. You don’t have that kind of discrimination and yet you’ve kept this kind of folksiness and civility—particularly in North Carolina, in Charlotte, cities like this where you don’t have the isolation of central city to suburbs. In North Carolina, everything that looks like a city becomes a part of the big city. Our school system is a unitary school system. There are not ten school systems in Mecklenburg County. There’s only one and everybody’s vested. Everybody’s kid has got to go there. So if we’re going to bus kids, we’re going to bus them equitably. That’s what our fight is all the time. If we’re going to educate the kids, we’re going to have to educate all of them. Now, middle-class people don’t pull out of the system and leave it just to being the poor kids, such as what we see in major American cities today. There’s more of a we’re-in-this-boat-together kind of thing. The President started that community race and issue thing—racial dialogue—and “Charlotte goes ten steps better,” you know. It forms a huge committee of folks. If you read the paper yesterday, you’ll see we’re talking about what we can do to improve ourselves from the standpoint of race relations.

So as Baldwin said, when it gets around to trying to deal with the race problem, perhaps the place that it’s going to happen best is going to be

in the South, where they are so close to each other and where the wounds have been so deep and where the healing probably can occur best—as opposed to maybe the more impersonal North, where legally we’re equal but one group of folks live over here, you live over somewhere else, and you really don’t have much to do with each other.

You have done something that’s pretty much unheard of in terms of not only running two campaigns against one of the most powerful senators in America but actually coming close to winning. What have you learned that you could pass on to the next generation about what you’ve learned in terms of being able to deal and work in a situation like that, to run a campaign—a major campaign in this country—against one of the most powerful senators in the country? What have you learned about that as a public figure?

Well, I know that politics is rough. But you know, I got into politics a long time ago, when I was about thirty-two years old. I became a member of the Charlotte City Council by being appointed to fill out an unexpired term. I took to it like a duck takes to water. I really enjoy this business of public policymaking. It seemed to delve in with a lot of what I’ve tried to do professionally—trying to work to build a better city, to plan a better city. So there was some relationship between what happened in the city government and what I was doing to earn a living. I enjoyed it. Plus, I enjoy people. I love people and I like this notion that we can be involved in making things happen. I always did believe that you can change things. Again, that’s out of that civil rights movement where we saw change occur. Little people all got together and changed society.

So that notion convinced me to keep going in politics. I got into the Helms races after tremendous success at the local level: council member, then vice-mayor, then mayor. Then I moved on to run for the Senate against Jesse Helms, and it was a totally different ball game. I mean, politics by this point had become much more mean-spirited. In fact, I lost the mayor’s office running for a third term against a candidate who was playing what we call hard-ball politics then—the politics of personal attacks, the politics of divisiveness. I didn’t like it in ’87 when I lost that race. I absolutely did not believe that a Jesse Helms best represented my vision of what the future was going to be and what I thought to be millions of others in the state who

thought otherwise. So we devised a campaign that was high-powered, that became national in its scope only because Senator Helms spent so much money in his campaigns until any opponent—unless they’re going to be just totally drowned out—could not be taken seriously unless they raised a relatively adequate supply of dollars. We campaigned all across America. The race had appeal because we were two people who had equal and opposite convictions about what the future was going to be.

I guess my lesson to a lot of people is you need to really stand up for what you believe in. I grew up in the South that way. I have parents who felt that way, who thought that education was important and did everything that they could to insure their kids could get that opportunity. Cindy and I did the same thing raising our four children. Here I was running as a mature man, at that time forty-seven years old, against a senator who had spent eighteen years at that point basically fighting against the very kinds of things that I was raised to believe in: equal opportunity in education, the right for people to go as far as their abilities would carry them. He had had a record that actually fought against that. So I got up and ran on my conviction and asked a lot of other people to support me, and millions of others did. Now, we didn’t win the election, neither one of them. The same narrow margin kept us from winning each time. But my sense is that I’m more right about what the future of North Carolina and America has to be than Jesse Helms is.

So there is value in that. Now what I’m trying to do is to get other people—who are younger, with greater energy, with more fire in their belly—to believe that they can make changes that are meaningful, that they can run against the Jesse Helmses of the world and be successful, notwithstanding the fact that right now my party may in this particular region of the country be the minority party in many cases, Democrats against Republicans. But I do believe that we learned a lot of things. One of them is, of course, stand up for what you believe in. Then plan carefully how you’re going to carry something through to the end and then carry it through to the end. I mean, be focused on it.

Two other quick questions. One is related, in fact, to the last statement you made. I try to ask it particularly of

those of you who really have a life that will show and give examples. Based on your own experience, is there any advice you might offer to other young blacks who would be either entering a place like MIT or just, say, starting out like you started out? I know that you have not only answers based on your own life, but also as far as your own children and everything else is concerned. What kind of advice would you give young, black, bright men and women whom we attract, for example, at MIT? What advice would you give them coming in as these very bright freshmen that I see coming in, and sophomores, or even the first-year graduate student? As you said, we're getting the best that we have around in the country in their particular disciplines. But they don't have the experience of a person like you. What advice would you give a person coming into a profession like that?

Well, first of all, they ought to be proud of themselves that they made it to an elite institution like MIT. That already sets them apart from the average out there. They ought to congratulate themselves on being as good as they are. But then I would hasten to add, "You'd better not rest on your laurels, or what is a moment of triumph will become a moment of shame so quickly. The world is changing and things are moving so fast that you are going to have to continue to work to prepare yourself for ever greater challenges." When I was a kid coming along, when I made that A on that exam, the next challenge was to prepare to make the A on the next exam. You cannot rest on your laurels. I couldn't have been very comfortable being a guy who could walk around for the rest of my life saying, "You know, I was the first African-American to go to Clemson University," and just try to live on that particular thing—something that happened thirty-something years ago. But once there, the challenge was to finish with honors. Then after that, the challenge was to become a great architect. After that, the challenge was one thing after the other. It's to keep finding challenges to stimulate that very fine brain that you've got up there, because we rarely use it. So don't ever think that you've reached the top. Success is always a process of moving, moving up.

Then third I would say that other people are looking at you. I don't mean just faculty and administrators or your peer students, but there's somebody in some community you left who says, "John or Mary was smart enough to get into MIT." So whether you like it or not, you're carrying a little bit of a burden. Wear it lightly, but it is

a burden that says, "Other people are looking at me to succeed, and I can do it." Finally, don't ever give up. I don't care how hard the papers get or how much you find out you don't know. Once you get there, there are going to be periods when you're at school there that you will discover—as smart as you are—you don't know a whole lot. Don't ever give up on yourself. Never give up.

You have seen a lot in terms of education, particularly educational institutions and including MIT. Are there any suggestions you would make to improve them? Are there some things that you think would help to improve or enhance the experience of blacks in schools like MIT, from the administrative level?

The usual thing we would say on something like that is, black people—young people—coming into school need to see more of their people in the administration, on the faculty, in the staff positions. It makes for a more comfortable environment for the black youngster. See, there's no question in my mind that being black in America anyway carries an extra burden. I'm a pretty good architect in my own right, and yet any time there is a job out there to be gotten I have to carry another burden—however lightly—on my shoulders when I go into the room competing against my peers, who ninety-nine percent of the time are all-white groups. Will, in fact, these people who are making the decision make their decision simply on the basis of my abilities, or will they make it on the basis of the color of my skin? As advanced as I have gotten over all these years, there is still that question that lurks back there. The question is, are you going to be defeated by that knowledge? That's just a fact of life of living in America.

But on campuses like MIT and Harvard and the other elite places, to the extent that they can make the institutions as comfortable as possible for their African-American students, I think there is a direct correlation on how well those students perform in those institutions and their feelings about those institutions when they leave them. Why do I say that? I did see a lot of folks back thirty years ago who hated MIT when they left too. They thought it was racist, thought that they didn't get a fair shake, that people never cared about their problems, nobody understood. Schools can't ignore that. Society is designed, in the majority culture such as we have here, to really accommodate that majority culture so that people feel more

comfortable. But what can schools do to make the place more comfortable for blacks? Well, it certainly can recruit vigorously for top faculty people when they can find them. It certainly can try to find administrators. It certainly can try to provide places and environments that allow folks to vent and to feel as if they're being listened to, making the environment comfortable for the folks.

I run an architectural firm. We have a very diverse firm here—whites, blacks, men, women. The job of the manager of this place is, if I want these people to be very productive for me, I don't go around as a tyrant saying, "Because I pay you X amount of dollars, I expect you to get that work done." I try to make that environment as comfortable as possible for all the people there. I will try to be as sensitive as I can to all the diversity that exists out there. What I don't know, I bring somebody in who does know what will make this place—what will keep morale high, what will keep folks producing. Well, I think educational institutions have the same responsibility. You're bringing in raw material, you're wanting to train and hone those minds, and you have to make the environment as comfortable as possible. It can be very intimidating to bring in a kid with 165 IQ intelligence who comes from a small, rural community, who needs a lot of exposure, but who has got the raw materials to be honed into maybe a brilliant scientist. How do you make him more comfortable in that world and not lose him?

It couldn't be said better.

I've been there.

JOHN M. DEUTCH

b. 1938, BA 1961 (history and economics) Amherst College, SB 1961 (chemical engineering) and PhD 1966 (physical chemistry) MIT; assistant professor of chemistry, Princeton University, 1966-1969; joined the MIT faculty in 1970; professor of chemistry, 1973- ; Institute professor, 1990- ; chair, chemistry department, 1976-1977; dean, School of Science, 1982-1985; provost, 1985-1990; accepted a position in the US Department of Defense in 1993, and in 1994 was appointed deputy secretary of defense; director, Central Intelligence Agency, 1995-1996, and then returned to the MIT faculty.

I was born in Europe. I immigrated to the United States with my family at a young age. I went to elementary school in Virginia and to high school in Washington, D.C., at the Sidwell Friends School. It's probably worthwhile noting that at that time the Sidwell Friends School was not integrated. I never went to school with a black until I went to college at Amherst in 1956. There were three blacks in my class at Amherst at that time, out of 250.

Have you seen them since you finished college?
I see them at reunions when I go back.

When you look back as far as that period of time before you got to college, who would you consider your heroes, your mentors, or people you really looked up to as role models?

Well, my father above all. My father had a tremendous influence on me. Both my father and my mother and a lot of my father's friends had a big influence on me. He had one friend named Paul Aiken who was a neighbor and who had a great deal of influence on me. My football coach in high school had a big influence on me. All sorts of people had a tremendous impact on me as I was growing up.

Could you say a little bit more about your parents in terms of their background?

My father was born in Russia and was educated in Belgium, where he married my mother, who was Belgian. They both went to the University of Brussels. They both got Ph.D.'s. They came from fairly well-to-do backgrounds and came here

because of the Second World War, because of the German invasion of Belgium in May 1940.

Tell me a little bit about the kinds of interracial contacts you've had over the years. Do you recall the early civil rights movement?

Yes, I do, because it was happening while I was in college at Amherst. The march in Selma was what year?

1954 or 1955.

It was a little bit later than that, but I remember at Amherst there was a lot of discussion about whether guys in my generation were going to take part in it. I remember in my fraternity, a person who was a year younger than me said should he go down there and do some marching in one of the marches at the time. I remember advising him not to go, that it was not something that I would recommend somebody get involved with.

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with John M. Deutch in Cambridge, Massachusetts, 24 February 1997.

I would say my interracial sensitivity or experience was very low until I got older, until I understood the world better than I did at that time. I know where it happened. It happened at the Pentagon, where the Army was so serious about the problems of dealing with an integrated force, especially after Vietnam. When I saw their commitment and their success in achieving integration, then I became more aware of the racial problems throughout the country. I became much more interested in the whole process of bringing the society together.

I was quite heavily influenced by a reading I did about the Austro-Hungarian Empire and the terrible problems in that empire when they were doing a simpler job, I think, than the United States faces today—integrating Hungarians and Austrians. I found it quite touching that a lot of the issues that were confronted at that time—affirmative action, a whole series of questions of equality, the feeling of community—were not handled properly then, but I thought in some ways maybe better than our country is handling them today. I became more convinced of the need to devote really serious attention to integration everywhere in society. I came late to it. It came late to me, but it was something that became important.

You mentioned the Pentagon and the armed services. There's a view by many people, and I tend to share that view, that they tend to do probably one of the better jobs of any agency in our society in dealing with the issue of race.

The Army, absolutely.

Do you know why that's the case?

Yes. Because after Vietnam, when there were very intense racial tensions, a young set of Army officers who ended up being the leadership knew that they were going to be dealing with an integrated military force, and they made a conscious decision all up and down the line to assure that there was equality and a fraternity among people that didn't pay any attention to the color of a person's skin. I think that's very much the case, and I would hold up the U.S. Army as being the best example of racial equality in our country.

What have you seen recently that may be hopeful in this whole arena of race relations, particularly after spending considerable time in Washington?

I think there are a lot of things that are hopeful. Not everything is hopeful, but some things are

hopeful. I think the tremendous growth of black Americans in places like MIT in the undergraduate student body is very optimistic. I think that's a big success. I think we have a lot to thank Paul Gray for, his leadership in accomplishing that.

That's one hopeful sign. I think the strength of the historically black colleges and universities is another hopeful sign that they're becoming sophisticated, knowledgeable, serious educational institutions and have strong commitments to their own purposes, but are also interacting well in government, with government agencies, and with other institutions. So there are very strong signs.

Particularly in your own role here at MIT as provost and dean of the School of Science and as a contributor on the faculty in a very significant way, what have you liked best or least about MIT's efforts to increase the black presence on campus here?

I like best the student program, as I said. I think students have been brought in here in MITES and a variety of other programs in an intelligent way. The admissions department has been very good at spotting students who are going to have a productive time at MIT, only accepting students who are able to survive the rigorous MIT undergraduate education. I think that the Equal Opportunity Committee, which was chaired by Herman Feshbach for so many years, has been a positive force in bringing administrators and faculty together under a strong person who is committed. I think Paul Gray's commitment to this is something which is really unique, sustained, and very important. So the student part of it, I think, has been very good and satisfying.

One of the parts that I find less successful, first of all, is that we still are not able to identify and attract black American faculty members. I guess I still worry about the continued separateness of black students on campus once they get here—separate living group, separate eating together, things like that. Now I must say, I've been away for four years, so I don't know how much of that is going on now. I understand it. I sympathize with it, but I wish there was more integration—with a small "i"—in student life. But the two big disappointments would be that and also the absence of our success in attracting black American faculty.

Let me just press you a little bit on the issue of black faculty. I know that you and Paul made major efforts to get departments to try to increase the number of black and

other minority faculty members. We weren't that successful. When you look back on it and as you see it today, what do you think are the reasons we can't do it?

It's pretty clear that especially in science and engineering the pool is very small. We are competing for those individuals with other schools who care as much about adding to their black faculty as we do. The younger Ph.D. graduates are attracted away by industry at much more attractive salaries. Many of them had loans from their experience as undergraduates and graduates. Facing the early years of an academic career is not as attractive as going to work for Bell Labs or going to work for IBM or the like. I think it's really a world of small numbers.

I don't excuse lack of performance, but I don't think MIT's record is bad compared to other schools. I don't know what I would do. I don't know if, looking back, there's any single thing that could have made a difference.

Do you see anything when you look at it now, just from a general viewpoint, with the host of experiences you've had in other places?

I don't have an answer. I haven't been back long enough to really have an appreciation of what the circumstances are like now on the ground at MIT, but I think it's a hard problem and until that pipeline really gets broader, it's going to be hard to do.

I want to shift to another topic, and that is mentoring young blacks in various capacities or positions that you've held, not only here but elsewhere. Your name has come up in several people's interviews. You can't say that you haven't been a mentor to a number of people. Can you talk about some of the people you think you've had some influence on?

I think one person who I'm very fond of and have had a big influence on is Kofi Bota, who is a graduate student here. He and I just got along right away. We were similar kinds of people. I stayed close to him all along. He's one that sticks out prominently in my mind as a person who really worked closely with me.

I don't really think of people by color, you know what I mean? I've had a lot of happy and successful work relationships with black Americans. I was heavily influenced when I was in Washington the first time in the Department of Energy by my secretary, Luana Clark. I think she mentored me. I do think it is terribly important to

students, especially, to make sure that they have support when they come to a place like MIT. We have, I think, a fairly consistent program.

You worked very closely with the only African-American we had on the Academic Council.

Shirley McBay.

What do you think about when you hear the name Shirley McBay?

Well, I have tremendous affection for her. I think she is a person of standards and of principle. I was a big fan of Shirley's. I was a big advocate of her. Not everybody always was, but I think she did an excellent job here. As I say, I'm perfectly happy with her performance, and, as I say, there's nothing more important than a person who has real standards and integrity. She had that. It was a good experience.

That's interesting, because I have interviewed those two people you mentioned, and they basically said the same thing about you. Maybe that's the way it has to work. What advice would you give to young blacks coming into MIT?

I think the thing that worries me the most is the consequence of the policy of admitting all qualified blacks who apply. We don't take all qualified white young men and women who apply. The result is that the black population will have more people in it who are going to face challenges in their academic experience here. I fear discouragement from that or the fact that they see that more of their visibly similar colleagues are having to stretch to make it, to get a feeling of frustration from that or a feeling of despair. They just have to stick to it. I worry that they'll be discouraged because of that.

In other words, I think we all realize if you look at the college boards, just to take an indicator, the distribution among black students is not the same as among whites. The result is that you can expect some of these individuals will need to take more time to learn material or master material. I worry that sometimes that will lead to a feeling of discouragement about the process. I would say individual patience is a very important property here, keeping at it.

You think that kind of process is necessary, though.

Absolutely. You see, if you said we are going to insist on the same distribution—highest percentile—you're going to have fewer blacks coming

to MIT because there's even more competition for the high percentile. I'm quite convinced it's the right road we're on, but there will be more pressure on the black student community.

If I take that and also look at the whole issue on a national level in terms of affirmative action, how do you equate the two? It's a big issue now.

Well, I'm a great believer in affirmative action. I had trouble when I was in the Cabinet, when the Court struck down a certain kind of affirmative action and George Stephanopoulos and others tried to structure a way of proceeding so that the Justice Department was able to continue to make reasonable steps. My view was, to hell with it. I call it affirmative action—keep on doing the same thing, because I do think it's important for the future of the country to stress opportunity. For me, it's opportunity. Giving qualified black Americans opportunity is quite different from saying you have quotas or things like that.

That's a big issue in the black community, particularly even among black students here, to get them to actually understand what you are saying and the stick-to-it-ness and patience that you're saying are necessary. Around them, quite frequently, they see the performance of others, in many cases, done with a little bit more ease, I would say. But, on the other hand, the idea of accepting the fact that they're not in the same quartile as others are, that's tough for them to accept.

I can understand that. I can appreciate that, but if you say, "Would you change your policy?" I would say no. What could MIT do to mitigate that? I would not want to give up the prospects of having more black Americans here learning and taking advantage of it.

Well, I'm happy to hear that and I totally agree. We know that patience has in the past paid off tremendously for a host of African-Americans who are doing some very outstanding work now. I've interviewed at least a hundred of them. There's a guy named Jim Turner, for example, who is the head of one of the federal laboratories and who got his Ph.D. from here. He's in Oakland, I guess it is, at an energy laboratory there. He's just one example of people who have gone on and are doing some very successful work. They had the stick-to-it-ness and patience.

Are there any nuggets of wisdom you could give based on the really vast amount of experience you've had in this whole issue?

One thing I would mention that has impressed me is the importance of leadership at the top. Paul Gray really was committed to this, and it had an influence everywhere, including on me. So when I went to the Pentagon, I insisted on having representation by myself and Bill Perry and Les Aspin on our Defense Equal Opportunity Council, which certainly continued the work with the intelligence community when I was there. I tried to convey to everybody the importance of race relations in this country. It's the serious challenge we all face. Leadership at the top is the most important thing. I really do think that Paul was especially committed and we all, in the history of the place, owe him the biggest debt of gratitude.

You certainly have a member of the choir here. I couldn't agree with you more. The more I look at all of the past history of this place, particularly in the late '60s up to the present, there is no person I know of who has done more. Absolutely.

GREGORY C. CHISHOLM

b. 1951, SB 1973, SM 1975, PhD 1989 (mechanical engineering) MIT, BA 1992 (philosophy and theology) University of London, STL 1994 Weston School of Theology; member of technical staff (MTS), Bell Laboratories, 1973-1976; mechanical engineer, US Department of Transportation, 1976-1977; consultant in private industry, 1979, 1982-1983, 1994- ; entered Society of Jesus, 1980; ordained Roman Catholic priest, 1993; assistant professor of mechanical engineering, University of Detroit Mercy, 1994- ; also taught at MIT, Holy Cross College, and Harvard University; member, MIT Corporation, 1974-1976.

I grew up in New York City. I was born in 1951 to Charles Chisholm and his wife Ann. My father was a New York City policeman, my mother, at least for the first part of my life, was just a mother. I was sent very early on to local Catholic schools because we were Catholic people and my father believed that the Catholic schools provided a better education. We lived in Harlem in a place called the Riverton, one of the earliest housing developments in New York. The status was that it was a housing development for black people and it was private, set up by the Metropolitan Life Insurance Company. I think they were catching really the postwar folks who were just coming back and had jobs and all that. They could capitalize on that.

But the local area Catholic schools were also very good. They were run by an organization called the Sisters of the Blessed Sacrament, and they had a lot of experience teaching African-American people. That was their whole mission, really, teaching African-American people. They were all white, as is typical in that kind of situation.

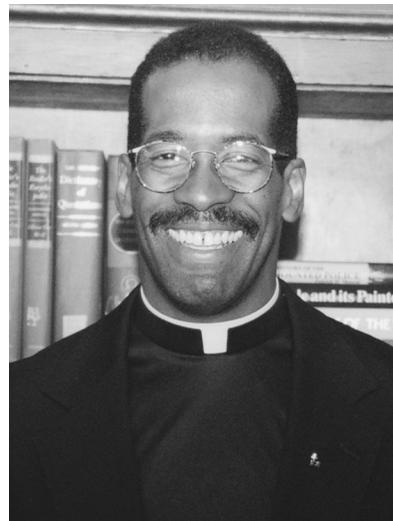

Anyway, my father very early on was primarily concerned that my math and science grades be the best. When I was in fourth grade, I came home with a report card and my report card gave me a 44 in science. I'll never forget. He marched me back up to the school. I don't think I ever remember my father being with me and a teacher before. We sat down and he wanted to find out why the hell I got a 44 in science. And the teacher explained to my father that in the third grade my father had moved me to a new school. He had

taken me out of a school in Harlem and moved me into a school that was mostly white. The teacher said, "There are a lot of transitions that he's going through," and that sort of thing.

So anyway, I never failed again in math and science, needless to say. That became the real important thing for my father. By the time I was about eleven years old, my father began talking to me about going to MIT.

That soon?

That soon. I don't know what happened. I would suspect my father had been turned on to MIT by a *Life* magazine article that came out in the late '50s. In it there was a picture of the graduating class from MIT, and it was called the most valued class in America, something like that. And because of the space race and all that sort of thing, my father just sat down and said, "Great area, major

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with Gregory C. Chisholm in Detroit, Michigan, 21 August 1996.

opportunity.” He wanted to make sure that, with the math and science, I would be capable of participating in that type of stuff. So when I was eleven, I’ll never forget—it was the first serious conversation I can also ever remember having with him—we talked about going to MIT and he really made it something interesting. I got quite enthusiastic about it without ever having seen MIT. My father had never seen MIT. We had never been to Boston.

So anyway, my trajectory was kind of set. Now, that is not to say that I didn’t have my own interests. My own interests really did not have a lot to do with math and science. Believe it or not, the first thing that I think I ever wanted to be—and it was when I was about twelve years old that I articulated this—was a priest. Yes, yes. I really always wanted to do that. I grew up Catholic and I was very involved in kind of the standard things that young Catholic men do, the altar boys and that sort of thing. My voice was higher and before puberty I was even in the choir, the boys’ choir. I was really attracted to doing that kind of thing, but my father would hear none of it.

One of the reasons we were all Catholic is because of him and his family, but he would hear nothing about me becoming a priest. He really tried to derail that kind of notion in me. Nevertheless, that is what I wanted to do. But I was also very interested in things like languages. When I got into secondary school, I started on the Latin and Spanish and would have taken French and all that sort of thing. But because I was on this math and science thing, I felt limited in the amount of languages that I could take. I always loved languages.

Anyway, when time came to go to MIT, I applied and it was the time, of course, when every major university in the Northeast as well as the country, I think, was looking for black students. This would have been the entering class in 1969. It was right after Martin Luther King’s death and so everybody was trying to get black students. It was a buyer’s market, really. My board scores weren’t bad, but I don’t think I was right at the top of MIT’s level. There were people in my class who had nearly 1600 board scores. Well, I didn’t have 1600. Anyway, I got in and got into a couple of other places.

Do you know the other places you applied to?

Yes. I wanted to apply to Stanford, but my mother wouldn’t let me. She said that it was too far and they wouldn’t be able to afford to bring me home. Where else did I apply? That’s really interesting. I’m drawing a blank here. They would have been other schools with engineering programs. I might have applied to Rensselaer Polytech? I can’t really remember. Most of the schools that asked me to apply, I didn’t respond to. You remember the late ’60s was also a time of emerging black self-consciousness, so people were revisiting black history, really going at it and trying to see what the competing forces were that put us in the position we found ourselves in during the late ’60s. So I somehow, in my effort to be politically correct, decided that I wouldn’t apply to any Ivy League schools.

And I think that was probably not a very good decision. I think in retrospect I probably would have done very well for myself if I had gone to a school that had both a very strong engineering and science program as well as a very strong liberal arts program, some place like Dartmouth. I fell in love with Dartmouth, actually, during my four years at MIT. Dartmouth would have been a place that I could have seen myself going, or Princeton or Columbia. They would have been real possibilities. Princeton was probably the school that I knew best before I began looking at colleges. We had friends in Princeton, New Jersey, so we would regularly see it. Anyway, those would have been real possibilities and I think I might have been able to respond to several of my talents and interests, really, if I had done that.

In any case, I did get accepted. I had applied to MIT in my junior year, but didn’t know of my acceptance. As it turns out, my father was working for Whitney Young at the time and Mr. Young knew a man who was employed at MIT at the time—very tall guy, light-skinned guy. Do you remember him?

Oh, Jim Allison?

Jim Allison. He knew Jim Allison and so called up, and evidently my parents knew that I had been accepted at MIT months before I knew. But anyway, they sent me up to Boston because we had a neighbor who was at Boston University. They sent me up to Boston with him and I visited MIT. Now that was before MIT went on the kind of redecoration binge that they went on. In the fall of

1970, they began repainting things. They let the students kind of do murals on the main hallway. They gave our dormitory paint to repaint the place. When I got to MIT in '68 as a pre-freshman, the walls were all gray and then they were white above the gray. The down part of the wall was all gray and it was just the most boring looking thing. It was all very functional, nothing exciting, none of the stuff that you now see when you go through the main corridor.

Since I was in Boston for an entire weekend, I took a trip around other places. I went to Harvard. Well, Harvard didn't look all that great to me, but what did look great to me was a place like Boston College. Now, there they had a lot of character, those Gothic buildings. They floored me. It could also have been that I went on a Saturday afternoon to Boston College. I was not with my minder. He and his girlfriend had gone off some place and they said, "Why don't you just go out?" So I got on the trolley and went off by myself. I got all the way up to Boston College. It was a beautiful Saturday, fall afternoon. The sun was hitting that place and I said, "This is where I'd really like to go." But I found there was a priest who was walking around the place. I said, "Do you have an engineering school?" He said, "No." I said, "Oh well, I can't come here." Anyway, it was the most attractive of the places that I saw. I eventually, of course, did come to MIT and it wasn't long after that first year that they really began trying to spruce the place up. I mean, it really changed. It's not the place that I saw as a pre-freshman, after that.

Exactly. When you actually came to MIT, in 1969, I would assume that there were very few blacks. Would you describe that to me?

I came and went up to every black person I probably saw. I remember there were fifty-seven in my class.

Fifty-seven blacks?
Fifty-seven blacks.

That had to be the largest class up to that time.

Oh yes. It was something that MIT had never seen before. Of course, I didn't know that they had never seen it before, but I know that we constituted all the black people that there were. There were about ten in the class ahead of us—people like Warren Shaw and Ahmad Salih, folks like that. There were a couple of other folks I didn't know as well. But they were in the class ahead of me, and

then ahead of them there were vanishingly few people. Maybe Ahmad Salih was one year ahead of them, actually. He might have been two years ahead of me. And then, of course, you had at that time some folks who had gone into graduate school. You had Shirley Jackson, who had gone to graduate school. Linda Sharpe, she was in graduate school at the time.

What was that like? How was that like, I mean, when you reflect back? Here are fifty-seven, largest class of black students ever to come into MIT. How did all of you fare, as you look back on that? How did you make out? Well, it's an interesting question. One could look at it objectively and say we didn't make out very well because less than half of us graduated four years later. It's clear that there were things driving, I think, the selection of our group that had less to do with making sure that we got the education that we needed and more to do with the university fulfilling its own kind of needs or interests. I was watching a film last night, where there was an educational institution and there were kids who were getting abused, basically. All of the efforts went into protecting the people who were running things, and the kids who were being abused just continued to be abused. I don't want to say that we were abused, it's just that I think in hindsight—and that's always clearest—I don't think that all of the best thinking went into deciding who would come and how they would fare once they got here. Now, nevertheless there were still some fine people here waiting for us, people who seemed genuinely interested in us—John Mims, and there was a man who was a psychiatrist.

Don Palmer.

Yes, right. He was here at the time. Jim Williams was here at that time. Ron Mickens was here. He was a wonderful fellow and very interested in us. Jim Bishop was here. You know, it wasn't necessarily a big happy family, but whatever—however I might have disagreed on one issue or another with any of those people—I know that they were genuinely interested in our success. Of that, I have no doubt. They would have very much liked to have seen us all succeed.

I think a very good person I liked to have around at MIT at the time was a dean in the student affairs office. She was actually the mother of one of the people in my class.

Mary Hope?

Mary Hope, yes. I just thought having a kind of matronly female around was probably great. We were only eighteen or nineteen years old and she was just a mothering type. You wouldn't go to her to fix up your physics problem set, but you might go to her just because it had gotten to be a bit too much. And she would hear you and speak in a way that Mims couldn't or didn't. There were those kinds of folks to help us.

But you know, to be honest, in spite of the fact that my father always wanted me to be an engineer, wanted me to go into math and science, I didn't know a lot about engineering. I didn't know what to expect, what it would really call for. I had not much of a sense. And because my interests were ambivalent, I didn't go off and just pursue all of those types of interests and finding out what engineering was like and all that sort of stuff. I relied a great deal on the advice of advisors. My freshman advisor was in the economics department. You know, it was largely on the basis of what he was suggesting to me that I determined my program. I wish in some ways that I hadn't had him. I wish that perhaps I had had someone either in an engineering discipline or non-engineering who knew a lot about engineering—just to kind of help me through it and help me think, because I really didn't know a thing. My father was a cop. He didn't know much about engineering either. I think I suffered from that.

In my class you had some very bright folks among the black students, as well as people who, although they may have been bright, had no discipline at all—no self-discipline.

Who are the folks who stood out in your mind as really being very outstanding?

In my class, I think you would have to say people like Mike Fant and Jim Gates. They were very serious students, you know. They took the academic stuff very, very seriously. Let's see. Who else was very outstanding in my class? Walter Gibbons. Walter was really sharp. Karen Scott. Karen Scott was very bright and William Scott, Bill Scott.

Yes, I think that's right.

Yes. And they were even married for a time, I think.

Yes.

They were very good. Among people ahead of us, a year ahead of us, there was Richard Prather. He was a great person, I think, to have as a kind of

older student. He was just a really fine man. Who else outstanding? Anyway, they were some of the bright ones, I think, in the class.

But MIT presented you with such a different life. It was a whole different culture, I guess, and a whole different set of expectations. A lot of people just couldn't run with it, I don't think. There would have been a lot of card-playing and stuff like that. I stopped playing cards when I got here. I mean, I just knew I just couldn't be playing any cards because those games would go all night. So I just never played. In high school I even played cards, but I just couldn't do it at MIT. Again, my father suggested something—wouldn't it be nice if I got involved with rowing?

You may have been the first black to ever be on the crew team.

That's right. I might have been, I don't know if I was.

I think that you were.

Yes, yes. I got into it because it was a sport where, at MIT at least, it didn't attract a lot of people who had ever done it before. So anyway, I got in and I did pretty well. I really liked the coach. I liked the varsity coach. He was a wonderful guy. He was fun, he was just so much fun. I really, really admired him. Anyway, I got involved with that. That took up time. I also got involved with Pete Buttner. Peter Buttner was, I think, the man who directed the Freshman Advisory Council. He got me involved in student organization stuff. Between the academic student organizations and rowing, I was probably more involved with non-academic things than I should have been. I mean, I was really doing too many things.

Part of it, as I look back at what was going on for me, I think I was at war—I mean, in my own self. It was nice to be at MIT, but I wasn't really all that interested in being an engineer. That was becoming obvious, and I wanted to do some other things just to keep myself happy and interested. Then sophomore year, I think, it really got particularly tough. Being away from home, my father wasn't there, so there was a lot of independence and a lot of things that I wanted to do, but in some ways I couldn't still because he was paying the bills. I had even begun a process in my second term, freshman year, of trying to transfer. I was thinking of spending a year away from MIT at another university because I was just feeling this wasn't going to work.

It was tough.

It just wasn't interesting, no. I was getting grades that were reasonable. I certainly wasn't a straight A student, but I was a B student. It wasn't that difficult, but it wasn't right somehow. It wasn't all that great a fit. I met some wonderful folks there, certainly enough. Coming from a black background and a kind of Catholic ghetto background, I met Jews and I met Asians and I met people from Europe. You know, that was exciting. I met some very bright folks at MIT. It was just great to have that.

Also, I guess on that crew team, for example, a lot of bonds were tied.

Oh yes. Those guys I still see. They call up and we still exchange Christmas cards. There are still meetings. There was a big meeting at MIT in '94 of the guys I rowed with. Yes, you're absolutely right. I would never have given up crew, no matter where I would have gone. But I might have, if I had gone to another place, given up engineering. I'm sure I would have had to tell my father, but I probably would have done that.

Anyway, the way that I got into mechanical engineering was really kind of ass-backwards. I fell into it, really. I took a freshman course, a computing course, that was sponsored by the mechanical engineering department. I liked it and liked the teacher, so I just went into it after that, but not for any reasons that I think would have been good ones. A good one might have been if I really found something within the department that interested me as work. But I had no help thinking that far.

That goes back to your freshman advisor who could have been more helpful.

Yes, yes. I had no help really thinking that far. For instance, now with my own advisees, I'm pretty aggressive at getting at the root of what motivates them. I mean, "What do you want? What are you looking for? What do you really hope to get? Are you really interested in motors or engines, like you say, or would you rather do something else? Are you unsure?" That kind of thing is so important in talking to an eighteen-year-old because there are all sorts of reasons why they may have come to college. It's good to get at the root of them, so that you can help them move through where maybe they need to get a sample of some things so that they can make a good decision.

When you look at our freshman year, I assume we still do it very much the way we did it in '69 with pass/fail, and in terms of a year of physics and a year of math.

That's right. I had a year of physics and a year of calculus. I placed out of chemistry because I had some college chemistry before. What else was there? There were freshmen seminars which you could take. There was a humanities requirement that you had to take.

But still, it doesn't get to the point you were making in terms of heading into mechanical engineering or Course VI or other engineering fields. You still didn't get a sense of those things that you needed to lead into them.

No, that's right. I didn't know really what was available and no one really got me thinking about, "Well, why are you here? What do you want?" That's the essential question. What do you want? What are you looking for? All that I was looking for is what my father wanted, which is no reason at all. But still, that's the reality. If you have strong parents, they are going to be like that.

Jumping back just for minute, you mentioned something about how you actually came in contact with MIT. I think for the record it's important that you say something about that. Who was the first person you came in contact with?

It was Warren Shaw. And MIT also had the Educational Council. They had a reception downtown in New York City. That was also part of it. I remember the reception very well, but I primarily remember Warren Shaw. What was nice about him, he was a normal person. He wasn't a nerd or anything like that. Warren was someone you could be proud to say, "Well, I go to school with this guy." That was really what was fine about it. Warren was black and he was from about a half mile away from where I was living.

That could make a difference.

Yes, that made a lot of difference to me. That was very encouraging. And Warren was well spoken. I think that would have made a big difference to me and my parents. In my family, I think language has always been important. To be able to speak well is very important. It would not have worked at all if Warren had come across in another way. That wouldn't have worked at all. Warren was the perfect ambassador.

For MIT.

Yes. And it wouldn't have worked as well with someone white, frankly. I went to a predominantly white high school. So those were my first contacts with MIT people.

Who would you say are the memorable role models or mentors in your studies and career and so on?

Jim Williams, I think, was very important to me. I had a course with Jim in my sophomore year, and Jim was the only person at MIT who said to me, "You'd better stop fooling around with a lot of stuff and get your work done." Jim could cut through stuff and just sort of lay it out. He said, "Well, this is what you need to do." And nobody else at MIT ever did that. I remember that conversation. Jim was a contact because he was a teacher of the course that I was taking. It was not part of the course for him to do that. He was giving me advice. So I'll never forget him.

You were just by luck able to be in a professor's class who happened to be black.

That's right, that's right. But I remember that. So Jim was very important to me. My mechanical engineering advisor was someone I liked. Tom Lardner was his name. Now he didn't get tenure so he didn't stay, but I thought he was a great teacher—that's first of all—and I thought he was very good with math. He was very helpful to me. The coach too. Without Pete Holland, I'm sure I would not have gotten through MIT.

Is that his name?

Yes, Peter Holland. He was fun. He was a relief from the burden of the rest of the campus. To go over to the boathouse, really you're punishing your body, but he made it fun. It was great. He was also a very practical guy. He was no fool. He was a Dartmouth grad. He was a bright man. And the guys were fun. I liked the guys. Pete was a good match, and so were Tom Lardner and Jim Williams. I can't think of other people. I remember Mary Hope.

Mary Hope, yes.

I liked her. I just liked her. I thought she was really good. I didn't go in and talk to Mims, but it always seemed like there was another agenda for Mims. It was never all that comfortable. There was always something else going on. Jim Williams was just memorable for me. I always trusted his opinion. I would always trust him and even in graduate

school. I never thought that he would lie to me. I never thought that he would misrepresent to me.

He was a real straight shooter.

Yes, a very straight shooter and I admire that to this day. Mary Hope, Peter Holland, and Tom Lardner. I also would say that I got to know Carola Eisenberg. She was someone I found extremely sensitive to the person here. Actually, I got to know her because I went to her for counseling when I was a sophomore. Things were just getting tough and I went to her to talk to her. She was just assigned to me randomly. It was a lucky move, it was lucky. And we saw each other outside of the context. They were only given a certain time they could see you, but she continued seeing me. She would ask me questions that nobody would ask. I still remember that. She was really wonderful.

I liked her a lot. She's a great person.

Yes, yes. She was excellent.

Why did you decide to go to grad school?

You know why. MIT is an infectious kind of place. I got caught up with all of the honor of it. I mean, once you get into the culture, the only thing that is valued at MIT is education. The only thing that seemed to be valuable was a Ph.D. in science or engineering. If you didn't do that, you were no one. So here's a guy, me, who always did what his father wanted, always did the thing that his father felt was the greatest thing in the world. Well, when MIT began defining what the greatest things in the world were, I just followed right along. It's a terrible way to live your life. I would never recommend it for anybody, but that is the way that I was coming along.

Your father had to be just so happy when you got your first degree from MIT.

He was. The irony, of course, is that I didn't even go to the graduation ceremony.

Oh, really?

There was a crew meet on exactly the same day. The biggest race of the year was that day. Now I knew it was going to be that day six months in advance and I began telling him, "Look, I'd like to go to the crew meet." And I really did want to go. Now my father, of course, is ambivalent here. My father is a bit of a sports fanatic. He wanted me to go into rowing to begin with, so after about three months he says, "Oh, okay." My mother, of course,

never forgave me for not going to my graduation. But the entire family—aunts, uncles, everybody—marched to Syracuse, New York, and saw me race that day.

That was like the graduation there.

Yes, exactly. My whole family came there. So anyway, it wasn't until I got my master's degree that they ever saw. But my father never saw it.

Oh, no.

Wait a minute, is that true? I got my master's degree in '75. He *did* see it. He saw the graduation in June, and died not long after that, in October of that year.

So he did see the graduation. That's wonderful.

That's right. But anyway, that's why. I mean, once I got to my senior year, and I was doing reasonably well, I said to myself, "Well, there are some interesting things within mechanical engineering." I hated all the lab stuff. I wasn't interested in building machines and all that sort of thing. What interested me were the mathematical things. Those were kind of curious and so I went into acoustics because I had no acoustics courses when I was an undergraduate. I said, "This is interesting because I don't know a thing about it, so it looks good"—all the wrong reasons for sort of moving ahead, but I did get ahead and always moved ahead. In graduate school I ran into John Turner.

In the graduate school? Yes, John Turner.

He was just great. A great thing, just real help. And also Steve Crandall, who was my advisor. He was a great teacher. He was probably the best teacher I've ever had in my life. His classes were wonderful, just so well organized. When I think of patterning myself after anybody, I think of him. But he was also a good advisor. I mean, he was friendly, he was accessible, he seemed interested in me. But there was a level of distance. He came from kind of the old school.

You know he was Jim Williams's mentor.

I do know. I know that.

It's interesting that he also was your advisor.

Yes, yes. When I got to graduate school, I knew that he was Jim's mentor. I didn't know as an undergraduate. But anyway, I continued there and I found the path of least resistance. I liked Boston and thought that it would just be good to stay there. In retrospect, I shouldn't have. I should have

stayed, gotten my degree, and then moved on. Even my father—this is going to sound really crazy—when I got my degree at MIT, my bachelor's degree, he said, "Why don't you think now about going to law school?"

It was really very crazy, but true to me—true to my father—about three years later, I at least applied. No, I didn't apply. I took the LSAT's, but then I just said, "I'm not going to apply, I'm not going to go through all this stuff. I'm not really all that interested in being a lawyer." The first thing that I did that I really wanted to do—actually, I did it within a year of my father's death—was to begin talking to someone about becoming a priest. That was the first thing that I did that I just said, "I'm doing this not because anyone has suggested to me that I should do it, but because I just want to."

But, back to MIT, I went through the Ph.D. program, and it was tough. I knew why it was tough. It was tough because my heart wasn't all there.

Wasn't in there.

I spent six years in the program. Part of that time I spent here in Detroit teaching, while I was doing it. I know that I had come here and was sort of shuttling back and forth between teaching here, University of Detroit, and going to MIT. I was teaching mechanics, vibrations, acoustics—things that I knew very well—but I just was not into doing it. I was not into doing that, that degree. So it just was painful. It was a struggle. And I'm sure Crandall understood somehow my desire just wasn't there.

And it's a real lesson because, as I told you, I ended up repeating the mistake in coming back here. I have determined that I am going to resign from the tenure track effective next year here, just because I know I can't continue this madness anymore. But I won't resign from the university. I'm probably going to get another job within the university. What that will be is yet to be determined. I know what is most clear to me is that I need to get out of spending eighty percent of my day doing engineering. What will probably end up happening and what would be good for me is that I would spend more like twenty percent of my day or less doing engineering. I have a consultancy that I have continued here with General Motors, and actually I rather like it. I like the problem that I have been working on. If I could do that one day

a week for a couple of hours a day, that for me would be exciting.

If you had to give a brief summary, an analysis of your perspective on the MIT experience, what would that be? I think that MIT was a very exciting place to be. My horizons were broadened incredibly during my several years there. What an opportunity to experience intellectual ideas, people, activities—certainly an experience I didn't have in the rather narrow experience of home. Perhaps as black neighborhoods go, Harlem wouldn't be considered narrow, but it doesn't provide the opportunity for encountering the broad range of possibilities that our world offers that MIT provided. I think that was a wonderful thing.

However, as I look back on my own time at MIT, I feel that I probably should have gone elsewhere. I think that because I probably needed a place where I could exercise some skills that I know I had, but that were perhaps not skills that were valued by my father at the time. I probably should have gone to a place where there was a broader range of possibilities. It may have been that I wouldn't have ended up getting a bachelor's degree in engineering. I might have, however, done a minor in mathematics or even some more applied science like engineering, but might have majored in another discipline entirely. For that, I would have probably needed a different sort of program.

In terms of how prepared I am for life, I don't think that I am unprepared because of my experiences at MIT. As a matter of fact, I think I am quite confident I can provide myself with the wherewithal to live by all of those sorts of things. I think I have a solid background. My comments really concern my own spirit—my own sense of what motivates me, what drives me ahead. As I reflect on that issue, I find that it probably would have been better for me to have gone elsewhere. But, one never knows when you look back. I can say, though, definitively that MIT was a magnificent experience. I have to say that I encountered things that I know I never would have encountered elsewhere.

Based on your own experience, is there any advice you might offer to other black students who are entering or planning to enter MIT at the present time?

I would say that the desire for success or money is insufficient motivation for making a decision on one's profession, on where one would get an edu-

cation for that profession. I think it is much more important to be driven in your professional aspirations, in the choice of educational institution, by your own desire—your own desire to find something or learn something or do something. If you have an issue or an interest to which you are drawn, I would say pursue that interest. Take the interest seriously. That is not to say that you put blinders on and narrowly pursue the interest, but I'd say let that be the center around which you create other interests or find other motivations. Let your interests be at the center and maybe success, money, and honor or whatever other things there might be as possible motivation, let those things be surrounding your interests. I would believe that if you have the intelligence, if you're gifted enough, that interest will carry you through and give you a satisfactory life—whatever it is, whether it's something having to do with technology or something having to do with literature. If you have the interest and the ability, you would be able to find opportunities and satisfaction in your life.

So as a consequence, in thinking about a place like MIT, I think one needs to consider that MIT is not a university that is broadly based. It has a range of things that it offers its students and that range is, as the literature suggests about MIT, polarized around science. The things that are offered are polarized around science and technology. As a consequence, in considering a place like MIT, one should have a very central interest in science and technology. I would further say that is distinguished from having an ability in it, because often the Lord has provided the human race with people who have multiple abilities. It doesn't necessarily mean that those are your interests. Because you can do something doesn't mean that you want to do something, or that you will do it, or that you even need to do it. So it is important to identify what it is that you want to do and, if you want to do something that has at its center science and technology, you can probably find no better place to study than MIT. And I really mean that. I don't think that you would get most of your support and practice in your interest from the classroom. I think you will get it from your associations with a top-flight faculty and some extremely bright students, your fellow students. I think they will help you move your interest along in a direction that will achieve the aims that you desire with that interest.

I think a lot of secondary school students probably don't know what they want. They have a set of interests, and so it behooves the institution to really help the student find out how best to help that person achieve his or her desire. I think advising for any academic institution is extremely important and it should not be—cannot be—perfunctory. One cannot presume that if a student is in your office, then that man or woman is ready and willing to follow the same course that everyone else has followed who comes through this institution. I think every case, even in a place like MIT, must be unique. I think the advisor, the freshman advisor particularly, really does need to spend time trying to identify with the student what he or she wants. What is his desire? What is her interest? Then build a program that would enable the person to follow through on that.

I also, of course, want to leave open the possibility that students come in not being very sure. They need to be given the space to find what it is they would like to do, with a bit of structure. I think MIT has enough supportive services where perhaps some specialist help can be brought to bear in helping the student identify what he or she might be good at and want to do.

Is there any other topic or issue that comes to mind that you can reflect on?

Yes. I think that I have come to appreciate over the last ten to fifteen years—more of the last ten to fifteen, I think—the importance of traditions. I've had an opportunity, primarily through my own speaking and preaching, to reflect on the history of my immediate family, of black New York, and black people across the country, and have appreciated that there are things that have happened to us that we carry with us, that are important to carry with us, that perhaps have seen us through difficult times. And there have been difficult times. I mean, the migration north was a very difficult time for black people. The wars have been difficult times for black people. We've had periods where diseases like tuberculosis have affected us in dramatic ways. But I think that there are ways in which we have learned to survive those things that I think need always to be held onto.

I believe that we are a people of faith. That is not to say that we are a people who haven't practiced, who have just knelt down and let God kind of wash over us in the midst of trouble. I mean that

faith has been a motivator for doing some very concrete things in our history. Some of the very strongest institutions—they are not the only strong institutions, but some of the very strongest institutions—have come through the church. Institutions that have been built from churches—business institutions, educational institutions—have come out of efforts that are primarily religious. I think that it is important for us to not eschew that. I am not, however, arguing for any kind of sectarian position. I'm not suggesting necessarily that all black people have to be Baptist. I'm certainly not suggesting all black people have to be Catholic. That would be a rather up-hill battle. But I'm not even suggesting that all black people need to be Christian. I have come to admire, from my own reading and meeting people, the intensity in which non-Christian blacks have gone about their faith. I think there have been Muslims I've met whom I have every bit of respect for, given the intensity of their faith.

So I think those things are important. But the reason I bring up the issue and all those sorts of things is at times they have gotten our people into thinking about the need for communal action. I think that faith has often been—not always been, certainly not the only thing but has often been—the rallying point for communal action for people deciding that it is important to bring their talents and interests to bear on the problems that affect us all. Another way to look at this or to talk about it is to say that faith has often been, although not exclusively been, a motivator for getting people to serve—black people to serve other black people in need, to serve black communities in need. I think that it is worthwhile recovering our tradition of faith, and I would hope that that faith would always issue into a desire to be of service.

I find it sad that very often, when on a college campus there are opportunities for volunteering, we don't get a kind of ground swell of support for volunteering in one thing or another from African-American students. I teach in a place where one could justify that lack of involvement in service in college on a number of levels. We have a lot of students who are working class, who have families, for whom going to school is one-third of their responsibility and so they don't have a lot of free time to do it. Nevertheless, I think it is important for us while we are learning to also involve ourselves in serving other black people. I

think you need to get used to bringing the history that you're learning, the math that you're learning, the computer science that you're learning, the engineering that you're learning—bringing that somehow to bear on the problems of black people.

There is no one way to do that, there are multiple ways to do that. It may not be that you can find the perfect fit between mechanical engineering and service to black people, but a mechanical engineer has such training in science and math that perhaps there is something in the training that can be brought to bear. Some of that could be direct classroom instruction, some of that could be helping out on building projects, some of it could be helping out on other training projects, or it could be working for a private firm that is doing some work that would be of benefit to the community. It could be something to do with environmental concerns or something to do with housing concerns, something to do with social system concerns, delivery of care, delivery of goods to people, or making technology available to people who because of their backgrounds and income—because of their race—just don't have access to it.

I think all of those things are possible for people who have a particular interest in areas that are polarized around science and technology and people who are learning those things now. Those people need to draw on the faith traditions of black people and see their role in our history as being at least partially having something to do with service—service to other black people, to the black community. I would say that's what I would like to see more of on college campuses around the country.

CHESTER M. PIERCE

b. 1927, AB 1948 Harvard College, MD 1952 Harvard Medical School; from assistant professor to professor of psychiatry, University of Oklahoma, 1960-1969; Alfred North Whitehead fellow, Harvard School of Education, 1968-1969; professor of psychiatry, Harvard University, beginning in 1969; part-time psychiatrist, MIT Medical Department, 1970-1992; elected to Institute of Medicine, National Academy of Sciences; president, American Board of Psychiatry and Neurology, 1978, and American Orthopsychiatric Association, 1983; founding national chairman, Black Psychiatrists of America, 1969; recipient, Solomon Carter Fuller Award, American Psychiatric Association, 1986.

I grew up in Glen Cove, New York, and my family consisted of my mother and father and two brothers. I'm the middle of the brothers. My father worked in a country club and I went to school through the public school system there.

When you look at your experience in pre-college days, were there any highlights that you can think of in terms of your education—role models or people who were very influential?

Well, it's hard to state. Lots of teachers, of course, were very influential and helpful. I think all through my life I've been fortunate to have lots of people who gave me all kinds of help. So it would be hard to single out, but I certainly had lots of people. Still undoubtedly, like most people, the strongest influences were my mother and father.

What about your high school? Talk a little bit about that experience. Was there anything like a subject you enjoyed, or teachers?

Well, I went to Glen Cove High School. I was much involved in sports. I played three sports. We had a state championship football team. I was president of my senior class and I was much involved in music. I really much enjoyed my high school days.

Academically, how did you do?

I was an honor student and I liked everything about the school.

I guess at some point you had to decide that you would or would not go beyond high school. How did that process evolve?

Well, there was never any doubt. All my life my father just sort of said I'd be going to college. He

died when I was still in high school, but there was never any doubt any of us would go to college. Not only that, but he used to sometimes get jobs—people in those days had railroad cars, private railroad cars, and he'd sometimes get jobs going to the Ivy League football games. He'd come back and tell us things like, "When you boys play at the Yale Bowl, such and such." So he had great hope and expectation that we would play in the Yale Bowl and so on, and in fact we did.

So you went off to college—not only you, but your brother as well.

Both my brothers.

All of you.

All of us went.

Tell me a little bit about what they did, where they went, and where you went.

Edited and excerpted from an oral history interview conducted by Clarence G. Williams with Chester M. Pierce in Cambridge, Massachusetts, 19 May 1998.

Both my brothers went to Cornell. My older brother was a Phi Beta Kappa and star athlete at Cornell, then became a lawyer. He's a tax lawyer, a corporation lawyer, and a partner in a New York law firm. He was also secretary of Housing and Urban Development. My older brother went to Cornell for college and law school and NYU for a graduate law degree. My younger brother went to Cornell and then attended Harvard Business School. He became a personnel manager and later—I forget the different companies—ended up as a vice president of the Battery Park development.

What years are we talking about between college and up to the point where they accomplished these career successes?

Let's see. I went in 1944. My older brother must have gone around 1939. And my younger brother is two years younger, so he came a couple years after. But I went to college in 1944.

It's very important, I think, because when we look at our country—what was happening during those periods—these were major achievements. You may not say it, but I happen to know that those were major achievements. In fact, I think one of your brothers knew very well a mentor of mine, Jerome H. Holland.

Indeed, I remember. He, of course, was a great all-American at Cornell and helped recruit my brother to come to Cornell. They stayed life-long friends. After Dr. Holland became ambassador, my brother and he still were close. And after Dr. Holland was on a number of boards of corporations and things, they stayed life-long friends.

Life-long friends. In fact, your brother was on the board of trustees at Hampton Institute when my wife and I were working at Hampton under Dr. Holland.

Yes, that's right. I remember he was on that board at that time. Of course, Dr. Holland asked him to do so.

Exactly. But let me come back now. You actually left high school. Where did you go from there?

I came to Harvard in 1944. I graduated in 1948 and I graduated at Harvard Medical School in 1952.

How and why did you choose your field? Was there anybody most influential in that choice? How did you decide to become a medical doctor?

I honestly can't remember. All my life I thought I'd be a doctor and just always said I'd be a doctor. I can't remember life without thinking I'd be a doctor.

So it was really built in for a long time that you were going to be, that you wanted to be, a doctor. You had a sense about that before you came to Harvard?

Oh, yes.

What was the Harvard experience like? You spent quite a bit of time there, undergraduate as well as your medical training.

I liked it very much. I did lots of extracurricular things. I played football, lacrosse, and one year I played varsity basketball as well. I was into all kinds of activities. When I graduated, I was elected marshal of my class.

That's quite an achievement.

They elected three marshals in those days as sort of permanent co-presidents, and I was elected marshal of my class.

You were really well known and well liked in your class, because that's done by your peers, is that not right?

Yes, that's right.

As one would expect, you're being very modest in that regard about all these major achievements. When you went to medical school, you chose psychiatry to focus on. Is that right?

Yes. Well, again, to put it in historical perspective, I think in the 1940s when I was in medical school, most medical students—much less most of the population—really didn't have a clear idea what a psychiatrist was or a psychologist or anything of that sort. I say it not just facetiously, but when Ingrid Bergman's movie *Spellbound* came out it really showed people—for first time, I think—what psychiatrists were. People had no idea.

I entered psychiatry not knowing whether I could earn a living. I didn't think there would be enough blacks who had money to pay for a psychiatrist and I didn't think there were enough whites who would come to see one. I just took a chance because I liked it and went into it. But I wasn't at all sure that I'd earn my living.

You took a major risk in that regard.

Yes, I did. I just said I liked it and I'd just see whatever happened. I got lots of encouragement from my teachers, so I went into it. I really didn't honestly know whether I could earn my living. I thought I'd have to earn my living, maybe I might get a job at a state hospital or something like that. When I was in my residency, my professor told me he was thinking about putting me on the faculty, and asked me not to accept the job which was

offered to me at Meharry because he wanted me to join his faculty. I had never thought about earning my living in academic work. In the '50s that wasn't done by blacks. At any rate, that's how I got into full-time academic work in the '50s.

I can see that being, during that time, a very important kind of decision because of the risk involved. All of the difficulties of being a black psychiatrist during that period I could see working against you, no question about it. There were lots of risks, but of course you're young and you don't know.

So there's something good about being young. That's right.

Could we talk a little bit about your field there before I actually come to your experience here at MIT? I think there's a much more important kind of input that I would love to hear you talk about. I know you've done a lot of work in terms of looking at how blacks have survived in various kinds of environments, and just in general the whole issue of your own profession. What are some of the things—even if it's been something you've concluded based on your experiences—that you have found have been fairly stable in regard to resistance to accepting blacks in, say, the work place?

That's a good question. One thing I think we have to look at, or at least I've always looked at from the other side, it's important for a black to realize that in most work places—if he's going to be working where there are white authorities or in predominantly white settings, which means practically every place a black would be—there's a big difference when there's some degree of acceptance. They'll let you work there, but there's a big difference between being tolerated and being welcomed. I think that many blacks make the mistake of thinking they are welcomed or should be welcomed, when they're merely tolerated. I think it's very difficult for us as a group to understand this, even though we've been oppressed all these years, I guess because people like to feel people like them and everything. So I think in a sense we have a lot of confusion about the difference between having some kind of warm tolerance and being accepted. There is a line, and I think that makes a clear distinction.

I think we also have to realize that in most settings, the settings aren't designed for us. We have to extract what we can from it and make it work for us, but it's really not supposed to be working for us—it's working for them. If we have to engage

in some kind of whether it's fair or not, or just or not, those things aren't relevant. The fact is that we have to do more for less and oftentimes we have to perform better just to stay treading water. I think that's the way I look at it. It's our view and how we adapt and how we perform that has a lot to do with how we get along in the work place.

So you actually put the onus more on us.

Well, we have to understand these things clearly and we have to understand that there's going to be bitterness. We have to understand that people aren't going to love us, even if they tell us that. There's going to be viciousness towards us. There are going to be obstacles. We don't get a fair shake. We have to be very clear about that and not expect otherwise. I think what makes people go crazy is if they grow up thinking the world's going to be one way and find it's another. So if you grow up thinking you're going to be a woodsman and at age twenty-five now go out to be a fisherman, you're in bad shape. So you have to understand what our reality is, and I think a reality check is that we're not warmly welcomed and that we're going to have a lot of obstacles both concealed and overt that we have to operate under. We can minimize them by good performance and I think also by being very cautious and careful and selective about our interactions with white peers and superiors and so on, that is, not expecting or wanting too much socialization.

You're saying that that is something that one should keep in mind.

Yes. You really have to be very cautious and selective about how much you interact with whites—also because I think it will wear you down. You have to preserve your energy, so to speak.

That's a very, very important point I hear you making. I think one of the things that seems to happen quite frequently, at least from my perspective just being here and hearing others talking about being in places like this, is that you find these environments shifting quite frequently. It's almost like you can't put your hands on it because you get to one point and you think that at that point you're going to be able to get something that you thought you were trying to get based on work and so forth and so on, and then all of a sudden when you get to that point the point shifts over here.

I remember, for instance, here we were told, particularly after Martin Luther King was killed, we were going to really do some great things in higher education—to

make some changes in administration—then we brought in administrators with the help of black students and we started working and doing these things, and our goal was to become these vice presidents: you get the right qualifications, you can get there. And then all of a sudden you get to these certain points, you got the experience, you got the qualifications, and they say, “Oh well,” and some other thing comes into play and you’re left just standing there.

You have to do more and expect less reward and you have to, as you say, keep the shifting targets, results about what you can get, and never relinquish power. That’s human enough, whatever color people are. But I think the big problem for the twenty-first century, given the demographic projections that we have, is how will white males respond to the erosion of their authority and power. You can make very ugly scenarios or you can make rosy ones. But that is the question, I think, that will be at the top of the twenty-first century—what white males are going to do as there’s more encroachment and erosion and threats to their hegemony, just because of the demographic shifts and no other reason. And, of course, there have been social changes too. We have to be in a position to anticipate and respond to that, I think, anticipating what they might do and what we can do.

When you look at the history, particularly in certain environments that we are familiar with, what would be your assessment of the twenty-first century in terms of how we will make progress?

I think we’ve done very well to survive and I’m optimistic, but at the same time all around me I see chilling and withering kinds of things happening to the great bulk of the black population. I think that there are going to be many issues. There’ll be both inter-ethnic conflicts that we’ll have to deal with—I’m sure that will be played one against the others—and intra-ethnic difficulties. I think that our Grail has always been a contingent bait to get more education. Of course, for whatever reasons we’re not getting much, particularly not the great bulk of us at the younger ages. I think this is going to be our problem. But in terms of long strategy I think we have to, as I say, anticipate what we have to defend against and take proactive stances.

I just came from a meeting this morning at 7:30, where the Brookings Institute gave a presentation through a couple of people. They are spending a lot of time going

around in all of the cities in the country trying to see what is happening to the urban communities and what needs to be done and so forth. One of the comments that was made this morning was that basically what has happened is that everything has really been taken out of the cities, the urban communities, and shifted to the suburban areas. Basically, poor black folks have been left in the cities with no jobs, with no essentials really to survive except to do all of the things that certainly are not healthy to human beings. We have not put money and we haven’t brought the resources to bear on this large group of people that are growing in that demand.

It’s been very much like you’re saying. We have to try to get some entrepreneurship back into those communities. In many cases it has to be forced in a way, and we as black folks have to understand that we have to play a major role in that. But I guess the point was that there aren’t any major cities doing anything to really alleviate that problem, although there’s a lot of talk. What’s your assessment of the situation from what you’ve been able to see?

I certainly have always felt that we have to have more entrepreneurial daring and adventurousness. We suffer from lack of that, and it’s the reason why we have suffering in both historical tradition and the political and social climate we’re in. It’s harder for us to become like that, but all the things you say are true and they’re very depressing. I think we have to have longer range plans—I mean, even decades-long kind of plans. Think out contingencies and plans and make progressive sacrifices for generations beyond us.

Let me put it more closely to, I think, an area that you probably have a better sense about. The Eisenhower Foundation came out with a report two months ago that really was an assessment of what we have been able to do regarding the recommendations that were made by the Kerner Report in 1968. Essentially, the facts show that we are worse off basically than we were then in terms of black males, in terms of what is happening to them and particularly in terms of the fact that there are more black males in prison today than there are in higher education.

So mentally, in some way, black males are taking a tremendous toll in this whole living process here in this country, in this society. Do you have any sense about what is happening? What do you think is happening in that regard, and what can we do to make a difference in black males’ lives to make them feel more capable of being able to be self-supporting of themselves and to be able to survive much better than at the present time?

That's a fair question, and again I have to claim no knowledge. I think a lot about it. I've thought a great deal about it, but the thing is I really am hard-pressed to have any kind of answers. The youth minister in our church talks to young black males all the time. In some ways, I think I don't understand what their plight is compared to like say twenty years ago. Even though I wasn't living like they were living, I still felt I understood a young black. But now, as he tells me the kind of things they're going through and the kind of lack of hope that they have and their visions that they have of the future, it's very difficult for me to understand their plight. I haven't had enough direct experience, but from what I hear I feel I'm quite alienated from them unlike I've felt before. It's worse.

Let me shift and ask you a little bit about how you happened to come to MIT. What have been your overall impressions of your experience here?

When I came to Harvard Medical School, I told the dean that I wanted to see patients but not charge them. And he immediately said to me—this is the Harvard Medical School dean—“You can work at MIT then.” And that was the first time I realized MIT and Harvard must have had a lot of collaborative agreements. I said to myself, “There must be guys sitting at MIT who get jobs at Harvard.” He just said that immediately. It was his first answer.

So that's how I came here, as part of my actual agreement with Harvard. I only worked here a half a day a week. I have a long experience, but a very narrow and superficial one.

Even though it was a short period of time spent daily, on the other hand you have been able to observe for a long time, even though it's been at a distance. What would you say about this kind of place here? You have some sense about it.

Yes, I have a sense because I've been a full-time university teacher for over forty years and know a lot about that kind of thing, about institutions and things. I think in terms of the way it treats its staff and students and faculty, it's superb—in terms of the kinds of issues that all these different groups bring to bear. They're very sensitive and so forth, and I myself was a beneficiary of such kind of treatment. So it's superior to and it certainly ranks at the top with any school. Of course, I've been to dozens and dozens of schools and some I've

worked at in depth. So I think that that's a fair assessment.

Like I said, you have to always be cautious about these racial things. The work I was doing, seeing patients who were staff members or family or students, I didn't particularly remember any harsh things that blacks encountered. There was nothing particular like that, in terms of chief complaints being a racial issue. But it would come up with blacks. Like any black patient, any place in the United States, you're going to have issues about being black—or should have—but nothing where some gross unfairness or indecency occurred or that kind of thing. I didn't see that. In my own relationships with my immediate department, they were very cordial and in fact I couldn't have done it without their great cooperation. I traveled a great deal, so sometimes I would make up time. I would go for two or three weeks and I could come back and put the time in. They were very generous and flexible about that, so I felt that in these areas that you question about, I didn't see any difficulties. Some patients, of course, had more troubles being black than others. That's the same like black patients every place, and of course there's always the interplay between their bosses and so forth and so on. But my overall impression was that there wasn't any kind of problems—that I saw as a psychiatrist—that were hugely different problems.

You mention the fact that you haven't seen any differences or not that much difference between the issues that blacks brought here versus anywhere else that you've dealt with. But if you look at, say, black patients in general, did I hear you say, for example, that some blacks have difficulties being black?

Absolutely.

Could you say a little bit more about it?

Well, a lot of the ones whom I saw here in my opinion had that trouble too—exactly how much to identify, all kinds of issues. I remember they brought high schools here back in the '60s, I guess, and some of them actually came to MIT after they came here for after-school activities. I remember one of them told me what trouble she had adjusting to her home, when her people here in Roxbury couldn't understand why she wanted to go on and get more graduate degrees. She said after she finished college, she had a chance to go on and get a graduate degree, and they couldn't understand that.

So there were issues on that end of the spectrum all the way to issues about people not wanting to be black and saying they weren't black, even though they were phenotypically black and people saw them as phenotypically black but they refused. So there are all kinds of ranges of problems like that about being black.

I have a question here about the influences on your academic, professional, and social life at MIT. How would you respond to that?

I guess I didn't have a lot of social interactions with any of the people at MIT. And indeed, as I said in general, I felt that one reason why I could preserve myself in the predominantly white environment I was in for forty-odd years was because I was very cautious and careful about interacting with white colleagues. I just deliberately was circumspect about it.

And your reason behind that is?

Because if I go to a party, say, of faculty at Harvard, one of my classmates—a college classmate who is a professor—will say something like, “Isn't it great how much progress we've made?” See, and I don't think so much progress has been made, but he's congratulating himself in front of me, making himself feel good. Then he'll give me some reason like, “You walk down the street, you see a Chinese girl walking hand-in-hand with a Puerto Rican, a black guy with a white girl,” and things like that. And if that's the progress, we're talking fifty-some years, that's not so much progress because in our time if any black wanted a white woman he could have had one, only thing you didn't see them walking hand-in-hand.

So I don't want to hear that. I think it does something to my stomach juice and my blood pressure and so forth, so I just don't allow myself to have this kind of conversation. All over the world, it's easier to sleep with people than it is to eat with them. And we make the mistake of feeling if we're accepted at parties and so on that they're really accepting us. That's the area I was talking about before. Just because they let you come to the dinner, it still doesn't mean you're accepted. At any rate, I think that there's a lot of troubles that we have confusion about that. I've protected myself by not interacting.

I think it's worth repeating. That's a very important kind of concept. Let me give you an example. As I said, Dr.

Holland was my mentor, and he's really the guy who helped me to leave Hampton to come to graduate school at the University of Connecticut with the intent of going back. Then he left and went to be an ambassador, so I never went back. But he was on the Corporation here at MIT, so I feel he had a lot to do with my getting here. And anyway, until he died, we stayed very close. At least, I always tried to get his advice. I always noticed that he would come to the Corporation meetings here. The business part, he would stay for that, but as soon as the business was over he was gone.

Yes, I think essentially I do the same thing. This is a hearsay remark to reinforce what you just said. My older brother once told me he believed that Brud Holland was the very best person he knew in handling white people, and he gave me many examples of how he just seemed to know their psychology, how much to push them, when to ask for things, and so forth. He was talking about subtleties and nuances, but he said he thought he was the very best person he'd ever seen at handling white people—which is quite a remark in terms of the width and breadth of people he had seen.

That's saying a lot, because your brother had seen a lot of people.

That's why it stayed with me. It's a hearsay remark and I don't know more details, but it stuck with me for that reason.

I had the highest regard for him, and the fact is that he did more for black institutions that he worked for. He was the president of Delaware State and then he also was, of course, president of Hampton. In both of those schools, he brought more financial support from very wealthy white organizations and white people than anybody before and even now, if you look at it in terms of the times. It had to be something. So it had to be something like what you said, that he had this knack of being able to work with them in such a way that he got their respect and they respected him. But he had his way of being able to deal with the situation where he didn't lose who he was.

That's right.

It's very important.

That's true. I'm so old, I can remember him when he was at Lincoln. He was assistant football coach at Lincoln. I remember going down because we knew Manny Rivero, who was the head coach, very well. But when Rivero brought him down there to coach, I guess he must have been just out of college. That's how long I remember.

I've heard Myra talk about you. One of the first things that I heard that I really was very interested in—and I really would like you, if you could, to say a few comments about it—is that you had a sort of theory about black space: entitlement of space, so to speak, that exists relative to blacks in an environment. Could you say a little about that?
